The Japanese demands for Fushun dust coal have increased, especially since the beginning of the current year. Already (Mar. 20) about 10,000 tons have been shipped, mostly to Kobe and Nagoya. Tokyo, too, has contracted for over 30,000 tons for delivery during 1912. Its peculiar suitability for ceramic purposes is now widely acknowledged in Japan; still, its use is at an experimental stage. There would be a rush for this dust coal if a reduction in price, freight, or incidental charges could be effected.

**Dalny-Yokohama Trade—Candle Factory.**

According to statistics prepared by the wharf office of the South Manchuria Railway Co., Dalny's trade with Yokohama in 1911 consisted of 188,777 tons of imported and 9,739 tons of exported articles.

The principal items were:

Imports.		Exports.	
	Tons.		Tons.
Cornstibbles.....	1,365	Beans.....	55,404
Tobacco.....	771	Bean cake.....	109,749
Sundries.....	7,613	Coal.....	13,261
		Sundries.....	10,373
Total, 1911.....	9,749	Total, 1911.....	188,777
1910.....	14,810	1910.....	111,179
1909.....	12,175	1909.....	161,629
1908.....	24,380	1908.....	83,952

Yokohama ranked first in the list of foreign ports to which Dalny shipped goods during 1911 and seventh as a supplier of Dalny's imports. The falling off in the latter was due mainly to a decrease in the imports of railway supplies.

The proposed candle factory for Dairen has so far failed to materialize. At present the only plant of this kind here is the one worked by the Sanshin Yoko. The capital invested in this enterprise is about \$5,000. The factory has installed 13 sets of machines, each set with a daily capacity of 3,000 candles of 12 ounces each. The best market for the output is Harbin and Chinese towns in the north. The principal materials are paraffin, bought of the Standard Oil Co., of New York, mixed with spermaceti. Paraffin imported from India is much superior in quality and will make a candle better adapted to the Manchurian climate but its price is almost prohibitive. Compared with imported candles, the local product is somewhat inferior in quality, but the difference is more than made up by its lower price.

**Glass and Tile Industries.**

The glass-manufacturing industry of south Manchuria is still in its infancy. There are 3 factories at Mukden, 2 each at Kirin and Changchun, 4 at Harbin, and 1 in Dairen (Dalny). The annual output of all of them barely reaches \$100,000 in value. The bulk of the

materials used by these works consists of waste glass collected for the purpose; the siliceous stone, which may be called almost ubiquitous in these parts, is practically left untapped. Some of the Japanese factories import their material from Mikawa Province, principally for making oil lamps (for Chinese customers), and glass flycatchers. Bottles for the use of the various hospitals and medical practitioners are in much demand.

The Miyazaki tile factory is by far the largest of its kind in Dairen. During 1911 excessive rains spoiled 100,000 pieces; in consequence, the total output for that year consisted of 500,000 pieces of red tiles made on the German pattern and 200,000 pieces of Japanese tiles. This factory has secured a contract for 600,000 pieces of terra cotta intended for the new Yamato Hotel on Central Circle. A drying house, with capacity of 200,000 pieces at a time, was recently completed. This house is two storied and has two kilns installed in the center of the lower floor. In addition to filling the contract mentioned the company expects to manufacture this year 600,000 red tiles and 300,000 Japanese tiles. As the result of the completion of the equipment, it hopes to lower its prices all around by one-half sen (approximately one-fourth cent) a piece, irrespective of the kinds.

#### **Stability of Manchuria's Foreign Commerce.**

An inspection of the customs revenue of the ports of Dalny and Newchwang during 1910 and 1911 would seem to indicate that the foreign trade of the Manchurian Provinces will retain its healthy condition for a long time to come, and that this trade will not only continue to improve the commercial conditions of the two ports mentioned, but give an added impetus to the commerce of Antung and Vladivostok as well. With receipts in 1911 of 1,358,000 haikwan taels [the present value of the haikwan tael is 70.5 cents United States gold], the customs port of Dalny is sixth in importance in China. The first five are: Shanghai, Tientsin, Canton, Hankow, and Swatow. Kiaochoo ranks seventh and Newchwang eighth in the matter of customs revenue.

The enterprising import and export merchants of Dairen (Dalny) have foreseen every future contingency likely to affect either branch of the trade, and the preparations made along practical lines have not only created a steady and permanent demand but tend to augment it in the future as well. In imports the demands of the native consumer have been consulted and complied with to the smallest detail, the convenience of steamer and rail transportation and the extension of credits being emphatic points of advantage. The 45 steam bean-oil mills now established in Dairen are evidence that in exports (of which beans is the chief article in Manchuria) the local port is certain to lead in shipments of bean oil and cake, the efficient and economical railway transportation facilities contributing largely to the enormous trade now had in the sale of beans to Japanese and to other Chinese ports.

---

Consul E. Haldeman Dennison reports total exports to the United States from Dundee, Scotland, for the first quarter of 1912, as being \$2,781,222, an increase of \$944,577 over the 1911 quarter. This increase was almost entirely due to the enormous quantities of potatoes shipped, the value of which was \$821,806.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8773. Telephone and telegraph supplies.**—Tenders will be received by the Deputy Postmaster General, Hobart, Tasmania, until June 10, 1912, for 6 miles of paper-insulated, lead-covered telephone cable (schedule No. 38); glassware for batteries and battery material (schedule No. 39); tape, ink, and oil for telegraph instruments (schedule No. 40); common battery telephones and parts (schedule No. 41); insulators and parts (schedule No. 42); iron, copper, and bronze wire, copper tapes and binders, and jointing sleeves (schedule No. 44); wire and cable (schedule No. 45). Local representation is necessary.
- No. 8774. Rails and fishplates.**—Tenders are invited until May 29, 1912, by the Secretary, Department of Home Affairs, Melbourne, Australia, for supplying 80-pound and 60-pound steel rails and fishplates, required for the construction of the Kalgoorlie-Port Augusta railway.
- No. 8775. Dredgers, barges, and steamers.**—The Minister of Commerce, St. Petersburg, Russia, invites tenders for 2 dredgers at an estimated cost of \$335,000; 6 steam mud barges, which will cost about \$370,000; 2 steamers, costing about \$40,000; and coal barges at an estimated cost of \$25,000 for the Sea of Azov. Tenders will be received through local agents only.
- No. 8776. Boats.**—The Treasury Department, Constantinople, Turkey, will accept tenders for 3 tugboats for the Tigris at an estimated cost of \$122,000; customs coast-guard vessels, estimated at \$75,000; and admiralty boats, the cost of which is estimated at \$90,000.
- No. 8777. Envelopes, ink, wax, etc.**—Tenders will be received at the office of the Deputy Postmaster General, Brisbane, Australia, until June 5, 1912, for envelopes (schedule No. 214), letter-box fronts (schedule No. 218), and obliterating ink, sealing wax, and twine (schedule No. 219). Local representation is necessary.
- No. 8778. Telegraph material.**—Tenders will be received by the Deputy Postmaster General, Melbourne, Australia, for the following supplies: (1) Until May 28 for 100 tons of bronze wire, 262 tons of hard-drawn copper wire, 188,500 copper binders, 11,500 sleeves, and 126,000 copper tapes (schedule No. 686). (2) Until June 4 for 373 tons of galvanized-iron wire, 51 tons of galvanized-steel wire, and 12,500 sleeves (schedule No. 687), and 1,000 telephone protectors. Local representation is necessary.
- No. 8779. Canvas.**—Tenders will be received by the Deputy Postmaster General, Sydney, Australia, until June 5, 1912, for supply and delivery of canvas, cotton duck, and tanned drill for two years (schedule No. 162). Local representation is necessary.
- No. 8780. Railways.**—The Public Works Department, Madrid, Spain, invites tenders for the construction and exploitation of a narrow-gauge line from Logrono to Torrecilla de Cameros. The same department will receive tenders until May 29 for the construction and exploitation of several sections of the Madrid electric tramways. Tenders will be received through local firms only.
- No. 8781. Pier construction.**—The Urban District Council, Rhyl, Wales, will accept tenders for the erection of a pier at an estimated cost of \$256,000.
- No. 8782. Cabinets and filing devices.**—Tenders are invited by the Egyptian Ministry of Finance for supplying 100 filing sections, 50 panel ends, and 100 index cabinets for the use of Government departments. Sealed tenders will be received until May 23, 1912, at L'Economat Central du Ministère des Finances, Cairo, Egypt, at which address the cahier des charges, together with samples may be seen. Temporary (legal) domicile in Egypt is necessary for the contractor.

**Dardanelles reopened.**—Under date of May 2 the American Embassy at Constantinople reports the decision of the Ottoman Government to reopen the Dardanelles to commercial traffic.

## DEVELOPMENT OF ERITREA.

[From Consul General James A. Smith, Genoa, Italy.]

The Italian colony of Eritrea comprises the littoral zone of Africa bordering upon the Red Sea, with Nubia on the north, Abyssinia on the west and south, and a small corner of the Sudan on the north-west. The southern and western boundaries have not as yet been definitely established.

The colony has an area of approximately 52,162 square miles, of which nearly half is included in the littoral zone, about 5,000 square miles in the high plains of the interior, 8,000 of mountainous country, 14,000 of valley and plain, and about 750 square miles in the islands forming the Dahlak Archipelago in the Red Sea.

The local government is administered by a governor appointed by the Crown, and his official residence is at Asmara.

### Agriculture—Live Stock—Fisheries.

Agriculturally the colony is yet largely undeveloped. Some Indian corn and sesame are raised by the natives in the littoral zone. Wheat is cultivated on the higher plains, but a full crop would probably yield not more than 10,000 tons. Some barley is also grown. Cotton is cultivated in the valley of the Barca, where the soil appears to be well adapted for its growth. This promises to become the most important of the agricultural products of the colony and it is hoped will eventually prove of immense benefit to the Italian cotton industry, which at present is almost wholly dependent upon foreign-grown fiber to supply its mills. Oranges, bananas, mandarins, and dates are grown, but of other fruit there is practically none.

The census of 1905 showed about 300,000 head of neat cattle, 750,000 sheep and goats, 30,000 horses, and 47,000 camels. These figures would doubtless be considerably increased if the census were taken to-day, especially in neat cattle.

The natives of the littoral zone in the vicinity of Massowa and of the Dahlak Archipelago are largely engaged in fishing for pearls, mother-

of-pearl, tortoise and other shells, and these articles form a considerable item in the export trade of the colony, especially mother-of-pearl.

**Imports and Exports—Industries—Transportation.**

Imports into the colony in 1910 were valued at approximately \$4,000,000, of which goods worth about \$3,200,000 were for local consumption and the remainder in transit. Exports during the same year were about \$2,200,000, of which \$1,400,000 were local products and the remainder in transit. Italy secures the largest share of the import and nearly one-fifth of the export trade. The principal imports are cotton tissues and yarns, machinery, iron and steel products, petroleum, olive oil, sawed lumber, mineral oils, Italian pastes, silk tissues and thread, and wine. The supply of wine in the colony is almost all of Italian production. Exports are chiefly pearls, mother-of-pearl, coffee, raw cotton, neat cattle, gums and resins, hides, flaxseed, wheat, vegetable ivory, and ostrich plumes.

The industries of the colony are almost wholly undeveloped. The natives produce with primitive means certain cotton tissues, which are said to be well made and quite highly prized, rough blankets of wool, mats of fiber of various qualities, and containers made of palm wood. Of European industries there are only a few, these being lime and roofing-tile works, ice plants, and several plants for making distilled water, certain liquors made from imported alcohol, flour mills, and the manufacture of charged waters.

The colony possesses more than 250 miles of good roads. There is only one railway, from Massowa to Asmara. From Asmara the line is to be extended as far as Cheren, a distance of 60 miles, and this will provide an outlet for the cotton raised in the valley of the Barca. The colonial government has assumed the construction and operation of this line.

**Maritime, Postal, and Telegraph Services.**

One subsidized line, the Società Nazionale dei Servizi Marittimi, has regular sailings every four weeks from Genoa to Massowa. Between Massowa, Assab, and Aden there is a weekly service. For those not wishing to wait for the regular steamers from Italy it is easy to reach Massowa from Naples by steamer to Alexandria, then from Cairo to Suez by rail, and from there to Port Sudan and Massowa by the Khedival Line steamers. Another route is from Naples to Suez, then by one of the steamers passing almost every day to Aden, and from Aden to Assab and Massowa by the weekly steamers mentioned above. Other steamers operated by the Deutsche Ost-Afrika-Linie run from Naples to Aden, and the Società Nazionale dei Servizi Marittimi operates steamers between Genoa and Bombay, calling at Aden. Finally, there is also a line of steamers operated by the Società Veneziana between Venice, Massowa, Aden, and Calcutta, with sailings once a month from Venice.

The colony has 11 post offices. For the interior, correspondence is carried by rail, by courier or automobile, and by mules. There is a weekly postal service between Italy and the colony via Brindisi. Correspondence from the colony for other destinations, if not going via Brindisi, is collected at Aden and sent forward from that point.

Between Massowa, Assab, and Perim there is a cable about 380 miles long. From Perim messages are transmitted by the Eastern

Telegraph Co. There is also telegraphic and postal service between the colony and the Sudan. In the interior there is a network of telegraph lines more than a thousand miles in length, and the recent opening of the powerful wireless station at Massowa places the colony in direct telegraphic communication with Italy through the station at Coltano (Tuscany), as well as with the other Italian colony, Somaliland, farther south.

**The Port of Massowa—Population—Budget.**

Massowa is the principal port of the colony. The city itself is situated upon an island connected with the mainland by a breakwater. Its population is about 1,300. The so-called "Commissariato," or district of Massowa, has a population of about 30,000, composed largely of Mohammedans. In 1909, 159 steamers and 1,294 sailing vessels entered the port, with a combined tonnage of 171,155. The merchandise discharged in that year was 24,711 tons. More than 13,000 passengers landed at Massowa during the same year.

According to the census of 1905 the population of the colony of Eritrea was 278,893, of which 274,944 were natives and 3,949 Europeans or of other nationalities.

The budget for Eritrea for the fiscal year 1911-12 shows that the revenues and expenditures of the colony are balanced in the sum of 10,464,444 lire (\$2,029,638), which amount, deducting the portion included in receipts and expenditures for railway work provided for by loans contracted with the Banca d'Italia, presents, in comparison with the budget for 1910-11, an increase of 166,788 lire (\$32,190).

**Receipts and Expenditures—Customs Duties.**

Under the caption "Rents from Government property" there merits being noticed the amount estimated from gathering the fruit of the "palma dum" (*Hyphæne thebaica*), which for several years has assumed importance in exportation and from which an income of \$6,755 is expected, while in the preceding budgets the income from this source was an almost negligible amount. Under the caption "Tax for vaccination of live stock" there is noticed the prestige acquired by the Italian vaccine institute, to which many animals from the Tigre are also conducted. Hope is expressed for a large increase in the exportation of live stock to Italy, and, in view of such eventuality and in order to organize the services necessary to guarantee the good sanitary condition of the animals, a special officer of the Italian Government has been sent to Eritrea.

In the expenditures the appropriations for the postal and telegraph services have decreased from 175,000 lire (\$33,775) to 130,000 lire (\$25,090). The smaller sum required is the result of an economy of \$11,580 which will be saved in the usual repairing necessary to the Massowa-Assab-Perim submarine cable by the opening of the radio-telegraph station at Massowa and of the greater need of \$2,702 for the other postal and telegraph services of the colony.

The receipts from customs duties have increased except for the revenues from the surtax on spirits, which are expected to show a loss of \$810, owing to the prohibition of the consumption of liquor by the natives. The revenues from all the other articles have advanced, and show a total gain of \$22,967 compared with the preceding budget.

**Land Titles.**

The land order approved by royal decree of January 15, 1909, is destined to facilitate agricultural production by dissipating doubt in the minds of those who desire to invest capital and contribute labor. The concessions cover about 1,400 hectares (3,460 acres), while those still to be definitely granted (although accorded in a provisional way before the decree) cover about 12,000 hectares (a trifle less than 30,000 acres). The concessions in course of regulation on December 21, 1911, were 215 in number, and the number of demands has materially increased since the land order.

[For previous articles on Eritrea see Daily Consular and Trade Reports dated Jan. 12, 1910, and Aug. 2, 1911.]

---

**VENEZUELAN DEVELOPMENT NOTES.**

[From Consul Thomas W. Voetter, La Guaira.]

**Government Agricultural School.**

The Venezuelan Congress will be asked to appropriate funds for the Federal school of agriculture, stock raising, and veterinary medicine established by a recent Executive decree. The decree stipulates that the school be provided with the buildings necessary for theoretical and practical instruction, boarding of pupils, installation of laboratories, model farm with its dependencies, and the fields which are required for pasture and experimental and demonstrating cultivation. The choice of a site is left to the National Congress. The Minister of Public Instruction will have charge of the organization of the school, its teaching staff, and plan of instruction.

The agricultural possibilities of Venezuela are so great and permit of so much development that the establishment of an agricultural school with model farm and experiment station as outlined in the decree promises much for the future of the Republic.

[From Consul Herbert R. Wright, Puerto Cabello.]

**Building of Wagon Roads.**

President Gomez, of Venezuela, has recently approved \$4,102 gold for building a wagon road between Maracay, of the State Aragua, and Ocumare, a small seaport about 10 miles from Puerto Cabello.

Gen. Leon Jurado, president of State Lara, has decreed the building of a wagon road between La Vela and Cumarebo. This road will facilitate the transportation of goods.

**New Steamship Line—Wireless Stations.**

President Jurado has also bought a steamboat in the United States to start a new steamship line for plying between La Vela, Venezuela, Curaçao, and Puerto Cabello. The new line will start at once.

President Gomez, of Venezuela, has just issued a decree establishing four wireless telegraph stations at La Guaira, Puerto Cabello, Maracaibo, and Cumana. Wireless companies might address Spanish correspondence to the Department of Fomento (Promotion) at Caracas, which is in charge of the installment of the said stations, or to Señor Manuel Ayala, 18 Broadway, New York City, who is the purchasing agent of the Venezuelan Government.

**CONSTRUCTION WORK ABROAD.****CANADA.**

[From Consul Frederick M. Ryder, Rimouski, Quebec.]

**River and Harbor Improvements.**

The Government has made a number of appropriations for river and harbor improvements in this consular district. A breakwater is to be constructed at Rimouski, approaches to the Government wharf are to be dredged, and water pipes are to be extended from the town limits to the end of the wharf. Other improvements are the enlarging of the wharf at Riviere-du-Loup, dredging at Isle Verte, the construction of a breakwater at Mal Baie, a new pier and other improvements at Trois Pistoles, and the enlarging of the wharf and deepening of the approaches at Tadousac. An additional appropriation of \$100,000 has been made for the deep-water wharf at Gaspé. New Government buildings are to be constructed at Gaspé, Matane, and Murray Bay during 1912, and the public highways are to be rebuilt.

---

**MEXICO.**

[From Consul Wilbert L. Bonney, San Luis Potosi.]

**New Gas Plant, Tramway Improvements, Electric Power Plant, and Railway Terminals.**

Plans for the construction of a gas plant here by American interests were formed late in 1911, under an amended franchise, and work on the plant is expected to start soon. The tramway in San Luis Potosi was purchased during the year by British interests and many improvements are planned.

A Canadian company with a large capital secured a concession for the utilization of water power in the eastern part of this State, and as soon as certain litigation is terminated it will erect a large electric power plant, from which power will be transmitted to San Luis Potosi and other cities.

The new station and freight house of the National Railways are nearing completion, and lands have been purchased for shops and general terminal facilities, including oil reservoirs. The State recently granted a subvention of \$100,000 to assist this work.

---

**PANAMA.**

[From Consul James C. Kellogg, Colon.]

**New Cigar Factory—Agricultural Development Company.**

The La Perla Cigar Co. (Ltd.) expects to move into its new factory, now in course of construction, by June 1, 1912. This factory is built of concrete and will be the finest cigar-making plant on the Isthmus. The general manager of this company, Mr. Charles Klinkert, is an American, as are a number of the stockholders. At present the cigars of this company are all handmade, but as the demand for its product is steadily increasing, it will soon be compelled to install cigar-making machinery. American manufacturers of such machinery should therefore get in touch with this company.

The Panama Development & Manufacturing Co., of Cativa Bay, Province of Colon, has been incorporated under the laws of the Republic of Panama, with a capital of \$250,000 gold. The stock is

owned principally by American canal employees. The plans of the company include the growing of sugar cane, cacao, coconuts, bananas, and vegetables; the raising of poultry, hogs, and beef and dairy cattle; and the production of sugar, sirup, alcohol, rum, cheese, butter, canned fruits, preserves, meats, catsup, vinegar, etc. The company has been granted 2,500 acres of land free by the Panama Government and has the right to purchase 15,000 acres adjoining for \$1 per acre. This company expects soon to let the contract for a sugar mill with a capacity of 1,000 tons of sugar per day.

### CUBA.

[From American Minister A. M. Beaupré, Habana.]

#### Transistland Canal for Shortening Route to Panama.

The local press is devoting some space to a project for constructing a trans-Cuban canal for shortening the distance between Atlantic ports of the United States and Panama. According to reports published, it is planned that a sea-level canal shall be built from Cardenas on the north to the Bahia de los Cochinos on the south coast, of the same width and depth as that traversing the Isthmus of Panama. It is reported to be the intention of the promoters that the canal shall be purely Cuban and that the necessary bonds shall be floated in Habana.

Among the engineers and promoters of the enterprise are Joaquin Chalons, until recently secretary of public works; Luis G. Estefani; and Dr. Carrera Justiz. The canal as now planned would cross one of the widest parts of the island, but the formation of the country is said to be such as to more than compensate for the increased distance over other possible routes. It is said that the canal could be built for \$90,000,000. [Maps showing the routes of the proposed canal are available from the Bureau of Manufactures.]

### BRAZIL.

[From the Review, Rio de Janeiro; sums stated represent United States currency.]

#### Industrial and Municipal Construction Work.

*The drainage system* on the island of Paqueta, being installed by the City Improvements Co., is now approaching completion. What remains to be done is to erect the stations.

*Railroad extension.*—The President of the State of Sao Paulo has signed a decree authorizing the Sao Paulo Railway to build a 20-mile line from Atibaia (on the Campo Limpo to Braganca section) to Piracaia.

*Construction company's expansion.*—The Companhia Materias de Construccao, of Rio de Janeiro, has issued \$135,000 in new debentures, of which \$64,000 is for redeeming a previous issue, the balance to be used for acquiring furnaces of a new type and machinery for the making of bricks and tiles, and for the substitution of electric for steam power in the factory.

*Street and park improvements.*—It is stated that the prefect proposes to widen the Avenida Atlantica, which runs from Leme to Igreja, and lay fresh asphalt over the greater part of it; pavements for pedestrians will be placed on either side, and the road made thus convenient for the public. During the last year the actual area of asphalt was no less than 423,733 square meters. The department of gardens and woods has also planted hundreds of trees in the streets and squares of the city. The prefect announces that a flower show will take place next September, and that before that date he proposes to hold a gardening exhibition. Both these will take place in the Quinta da Boa Vista, where he is also desirous of establishing a zoological garden.

*New building corporation.*—An important combination has been formed between leading British and French groups for carrying out Government financial operations

and public works, principally in Brazil and other parts of South America. The nominal capital of this Anglo-French and South American combination is \$5,000,000, and the first subscribers include Lord Furness (chairman); S. Pearson & Son; Societe Centrale des Banques de Provinces, Paris; the Caisse Commerciale et Industrielle de Paris, which has already carried out important financial operations for the Government of Brazil and elsewhere; the South American Railway Construction Co., of London, which is now constructing important railways for the Brazilian Government and other works in Brazil. The commercial interests of the corporation will be represented at Rio de Janeiro by Hugh Stenhouse, for many years general manager of the City of Santos Improvements Co., which position he resigned to represent the present combination and other interests in Brazil.

---

### ARGENTINA.

[From the South American Journal.]

#### Contracts for Railways.

The Government of the Province of Salta had published the conditions on which it proposes that economic railways serving districts in the Departments of Oran, Rivadavia, and Anta, which are at present outside the range of the national railways, shall be constructed. The lines will be constructed by contractors selected by the Government, and the cost of construction and also of rolling stock is to be paid off within 25 or 30 years, during which time the provincial government, as well as private individuals and firms benefiting directly by the line, would pay a proportional tax. It is considered impossible to undertake the scheme without the imposition of this tax. Should the National Government find it convenient to purchase the lines, the payment would be devoted to works generally benefiting the province. The gauge of the lines is to be the same as that of the national lines. All costly and elaborate work is to be avoided, and the stations are to be of simple construction. It is estimated that the cost per kilometer would not exceed \$10,000 gold.

---

### RUSSIA.

[From Consul John H. Grout, Odessa.]

#### New Quays at Odessa.

As the present accommodations of the commercial port of Nikolaief, consisting of one Government granite quay and two private wooden quays, are insufficient for the growing trade of the port, the Nikolaief town council in 1910 decided to construct a quay adjoining the one owned by the Government. The work of dredging, pile driving, and filling in was actively carried on during 1911, and the solid work is being vigorously pushed during the present spring. This quay will provide accommodations for seven steamers, and it is proposed to fit it up with the latest mechanical appliances for the loading of grain. It is as yet impossible to say just what the equipment of the quay will be.

The St. Petersburg International Forwarding & Storage Co., which owns a piece of the foreshore adjoining the town's property, is considering the construction of a quay for the accommodation of about four steamers. Should this project materialize, special facilities for handling iron will probably be made a leading feature.

---

### NETHERLANDS.

[From Consul General Soren Listoe, Rotterdam.]

#### Harbor Works on the Maas River—City Improvement in Rotterdam.

During 1911, 808,308 cubic yards of earth were removed in the dredging of the new harbor, Waalhaven, and on January 1, 1912, the surface water covered 140 acres, of which 116 acres had a depth of 28 feet. [This harbor was mentioned in Daily Consular and Trade Reports for May 6, 1911.] The city government has purchased

ground on the right bank of the Maas River, near Schiedam, where it will dig out three small harbors, 160 by 2,300 feet, 400 by 1,800 feet, and 330 by 1,100 feet, respectively. Dredging will be commenced during the present year, and the city expects to spend about \$3,000,000 on building the harbors and the necessary quays.

A movement for the reforming as well as the beautifying of Rotterdam has been inaugurated by the present burgomaster, and has met with the approval of the city council and the citizens. As a link in the various improvement works contemplated, the city has purchased or expropriated 280 houses along part of the "Coolsingel," one of the city's canals, covering about 6 acres of ground and sheltering 2,400 people. With the principal view of doing away with certain slums, these houses are being demolished, and the erection of a new city hall and a fine post-office building on the site are contemplated. The "Coolsingel" will be filled up and a boulevard laid out. Plans for the new buildings will soon be called for, but it has not yet been decided whether or not consideration will be confined to native architects and contractors.

---

#### SWITZERLAND.

[From Consul George Helmrod, Berne.]

##### Swiss National Exposition—Railway Projects—Municipal Improvements.

Preparations are being made for the Swiss National Exposition, to be held in Berne in 1914, and the conditions under which American manufacturers may possibly exhibit are being studied by the commission in charge. In addition to this exposition, the completion of the Loetschberg Railway through the Bernese Alps and the proposed roboring of the Hauenstein Tunnel on a lower base, on the trunk line between Berne and Basel, are expected to bring additional prosperity to Switzerland's capital city.

Among the new projects proposed or in process of construction here are a new municipal slaughterhouse, an extensive municipal hospital, several hotels, the rebuilding and enlargement of the passenger and freight terminal stations of the Swiss Federal Railway, a new Volks house, a new Kursaal, and an extension of the municipal street railway line. The more important banks have either rebuilt or erected new homes with modern equipment. Ordinary building speculation is restricted, however, by the unwillingness of banks to loan money for this purpose to any but first-class firms.

---

#### SWEDEN.

[From Consul Stuart J. Fuller, Gottenborg.]

##### Harbor Improvements at Gottenborg.

Much was accomplished at Gottenborg during 1911 in dredging, piling, and building quays at the new harbor basin designed for the handling of bulk cargo. No date has been set for the opening of this harbor. The new basin for fishing craft, opened in 1910, was enlarged, and the dredging of the harbor entrance from a depth of 24.6 feet to a depth of 27.9 feet was about half completed during the year. A further extension of the basin for fishing craft, to cost about \$145,000, and an extension of the Stigberg Quay, to cost about \$120,000, were also decided on.

**TURKEY.**

[From the Near East.]

**Proposed "Tube" Railway.**

It is understood that the Turkish Council of State is studying a project for an underground line to connect Stambul with Pera under the Golden Horn. English engineers are expected in Constantinople shortly in connection with a scheme to build a double tube connecting the termini of the Oriental & Anatolian Railway, the proposal being to lay a double tube between the extreme point of Stambul and Haidar Pasha under the Bosphorus. A suspension bridge across the narrowest part of the Bosphorus, to connect the European and Asiatic railway systems, has at various times been suggested; but the tube scheme, if it ever materializes, has decided advantages, in that it touches the very heart of the traffic.

Application has also been made for a concession for an electric railway from Galata to Roumeli-Fener, at the mouth of the Black Sea, and has recently received the approval of the Council of Ministers.

[Reuter dispatch from Sofia.]

**Railroad Connection Between Turkey and Bulgaria.**

The semiofficial "Mir," commenting on the fact that the Ottoman Government has at last consented to the construction of a railway line between Kumanovo and Kustendil (by which Sofia will be brought into railway communication with Saloniki), says that this step is of great importance for the two countries concerned.

**SOUTH AFRICA.**

[From Consul Nathaniel B. Stewart, Durban, Natal.]

**Extension of Electric Light and Power Systems.**

The boroughs of Pietermaritzburg and Ladysmith, Natal Province, propose shortly to extend their electric lighting and power plants. A draft ordinance for each, to be introduced in the provincial council, authorizing loans for the extensions, was published in the Provincial Gazette of March 21, 1912.

The proposed expenditure on the Pietermaritzburg extension is \$206,826, and on the Ladysmith extension \$58,398.

**JAPAN.**

[From Consul George N. West, Kobe.]

**Extension of Kobe's Water System.**

The subsidy for the extension of the Kobe waterworks [an account of which was published in Daily Consular and Trade Reports on Apr. 15, 1911] has been passed by the Diet. The cost is estimated at \$4,975,000 (United States), of which sum \$1,215,000 is to be provided by the national treasury, payments being spread over a term of 12 years. The work, which will probably be undertaken during the current spring, is to be completed within eight years. Any communications respecting the furnishing of supplies should be addressed to Y. Senzaki, Department of Supplies, City Office, Kobe.

[From Consul Carl F. Deichman, Nagasaki.]

**Improvements in Shipyards of the Nagasaki District.**

The Mitsu Bishi Dockyard and Engine Works have obtained permission from the Japanese Government to reclaim about 470,000 square feet of land from the harbor in front of the shipyard. This land will be used for the extension of the company's works, to meet the requirements for building a 27,000-ton battleship cruiser for the Japanese Navy. The same company is also going to build a small

shipyard near Shimonoseki, to take care of the docking and repairing of small steamers in those waters. Vessels up to 3,500 tons will be accommodated.

Extensive improvements in the yards, docks, and machine shops are being made at the Government navy yard at Sasebo, about 46 miles north of Nagasaki. The large wharf is about half completed, and when finished will be the largest of its kind in the Orient, accommodating eight large battleships at one time. It will be connected with the railroad. The construction of a dry dock 777 feet long, 111 feet wide at the bottom, and 38 feet deep is about completed. This dry dock will accommodate ships of 30,000 tons, being the largest in the Orient. The engine works, machine shops, foundry, etc., are being extended to facilitate the execution of all kinds of work at the yard.

[From the Japan Herald.]

#### **New Harbor Construction.**

A new program of harbor construction for Tokyo has been completed and is now in the hands of the chief of the river and harbor department of the Tokyo municipality. According to the new scheme the mouth of the Sumida River is to be included within the harbor limits to facilitate connection between the harbor and the rivers and creeks in the city. The work is estimated to be completed in 12 years, and the expenditure is estimated at \$18,500,000. Work is to be divided into two periods, the first term covering eight years. During the first term the harbor-construction program is to be almost completed and in the second term the construction of docks, reclamation of foreshore, and dredging work is to be carried out. The actual amount of capital required is expected to be about \$6,000,000 to \$6,500,000, as about 74 per cent of the total expenditure may be covered by the sale of reclaimed ground. Mr. Nanbu, who is commissioned by the Tokyo municipality to investigate the economic value of the proposed harbor, states that the trade of Yokohama would not be affected by the construction of the Tokyo harbor, as the objects of the construction of a harbor at Tokyo are quite different from those of Yokohama. Moreover, the foreign trade of Yokohama will grow even more prosperous on the completion of the Panama Canal. The harbor of Tokyo will be close to the business quarter of the city.

#### **GOLD MINING NOT ENCOURAGING IN BOLIVIA.**

[From American Minister Horace G. Knowles, La Paz.]

Many American citizens are coming to Bolivia in search of gold, being misled by what is now stated to be a fake letter signed by one Ferguson. Unfavorable reports are brought by miners who have returned from Tipuani and the outlook is not encouraging.

According to advices received at this legation numerous Americans in the western part of the United States are preparing to come to Bolivia on the strength of these false reports. This warning should deter them from embarking on such hazardous undertakings. A further report will be made in the event that any of the prospectors whom the Bolivian Government has sent to various districts are successful in their search for gold.

#### **European Agricultural Tour.**

A second annual European agricultural tour under the auspices of the Bureau of University Travel, Boston, Mass., is announced for this summer under the direction of Dr. Adolph Eichhorn, a veterinary inspector in the Bureau of Animal Industry, Department of Agriculture, at Washington. He will be assisted by Hon. Paul De Vuyst, Director General of Agriculture for Belgium. Among those who have arranged to take the trip are editors of farm journals and members of agricultural experiment stations in various parts of the country.

**ASIA MINOR CROP PROSPECTS.**

[From Journal of the Chamber of Commerce, of Smyrna, Turkey.]

**Sultana Raisins.**

According to forecasts, the produce of this year's crop of sultana raisins will be below the average on account of the damage suffered by the plants in 1910 from peronospera. The unusually high temperature of January produced a rising of the sap and a tendency to bud at a time when the vineyard plains were liable to frosts. Probably even under normal conditions the crop will not exceed 800,000 cantars (cantar=125 pounds), as against an average yield of 1,200,000 cantars.

**Valonia Dycstaff.**

The yield of the 1911 valonia crop, which is almost completely gathered, is estimated at 900,000 quintals, as against a normal crop of more than 1,600,000 quintals (presumably the metric quintal of 220.46 pounds). The quality is, on the whole, inferior.

**Opium Output.**

Should all go well, it is generally reckoned that we shall have an opium crop of over 7,000 cases, of 160 pounds per case, including the Saloniki crop. The visible stock on this market in first and second hands is about 700 cases, but we believe that 200 to 300 more can be produced if wanted. Future prices depend upon the crop, also on the demand from consumers; but, whatever the outturn, we are not at all inclined to think that this year we shall see anything lower than \$3.65 to \$4.40 per pound.

**Reduced Planting of Tobacco.**

It is rather early to say much about the new crop, but from all appearances it promises to be one of probably 4,000,000 to 5,000,000 oke (oke=2.8215 pounds), providing the weather conditions are favorable. The planting is about half of that of last year, as the planters lost money, and owing to there being no hope of getting money advances from the merchants on account of the crisis.

**Olive Oil.**

Next season's crop is not likely to be so big, as a record year such as the last is usually followed by a poor yield. Present prospects point to next season's crop being an absolute failure.

**COMMERCIAL GROWTH OF NYASALAND.**

[From Consul George A. Chamberlain, Lourenço Marques, Portuguese East Africa.]

In a report on the Companhia do Nyassa (the Nyassa Co.), a chartered company operating in Mozambique Province, with headquarters at Porto Amelia on the Bay of Pemba, its progress is described by the *African World*. Some notes therefrom follow:

The territorial revenue increased from \$29,199 in 1897 to \$309,509 in 1910. In 1897 there were only two real centers of European occupation, Ibo and Palma (Porto Amelia), both on the coast. The company now has 58 posts, nearly all centers of settlement and scattered throughout the 100,000 square miles of territory between the coast and Lake Nyassa. The exports for 1910 aggregated \$398,621 and the imports \$580,000. The imports are largely made up of cotton cloths, foodstuffs, and tobacco, and the principal exports are crude, native products, such as peanuts, low-grade rubber, wax, ivory, dried fish, etc.

**Big Prospective Canadian Crops.**

There is at present a prospect of a 200,000,000-bushel wheat crop in western Canada this year. This statement was wired from the Minister of Interior at Ottawa to Lord Strathcona, Canadian High Commissioner in London. The dispatch continues:

Saskatchewan will have 2,303,226 acres of new land under crop this season and 2,188,118 acres of summer fallow. This large acreage is in ideal shape for a bumper crop. In some parts of western Canada the unusual condition exists this spring of seeding, thrashing, and plowing going on practically at the same time.

The Canadian Pacific Railway Co. proposes to establish 25 demonstration farms in western Canada to prove the efficiency of mixed farming.

**THE BETHLEHEM MOTHER-OF-PEARL INDUSTRY.**

(From Vice Consul Lewis Heck, Jerusalem, Syria.)

The chief industry to-day of the town of Bethlehem in Palestine is the manufacture of articles of religious devotion and ornaments from mother-of-pearl. The methods and tools used are mostly quite primitive in character, as are also the buildings in which the workmen carry on their trade. The principal products are carved shells on which religious scenes are depicted, beads, and rosaries. The material known as "pearl waste" from which the two latter products are made is very largely imported from the United States, and the American market also is the largest purchaser of these goods. The large carved shells are sold mostly to tourists in Jerusalem and Bethlehem, and since the demand for them is not so good as for beads and a higher grade of workmanship is required to produce them, this side of the industry is losing ground to the manufacture of beads. This report will deal entirely with the latter part of the business.

**Manufacture of Beads.**

A bead workman's outfit is primitive, consisting of files, borers, and a simple wooden device for holding the irregularly shaped pieces of pearl waste. This last is made of a short, round piece of wood sawed in half lengthwise, fastened together at one end, and encircled by a loose iron ring. The piece of pearl shell is placed between the loose wooden ends and the ring is hammered toward it until the grip is tight. The workman then files the part of shell which extends to the desired diameter, it is reversed in the holder, and finally a rounded piece of perhaps 1 to 3 inches in length is secured. When a number of these pieces have been prepared they are cut to bead size, a hole is bored in each bead, and it is rounded to the desired shape. Then to give the beads a smooth surface they are placed in special crockery vessels with a little water and are kept in motion in these vessels, rubbing against the sides and each other until they are smoothed, but not polished. To give them a gloss and sheen, they are finally placed in boiling water, to which a weak solution of nitric or muriatic acid is added, and when removed from this they are passed through a succession of cooling waters. There are three usual shapes—those flat on two sides, round, and oval.

These beads are strung on cords, silk, or wire, and always on the latter in the case of rosaries. For these last also crosses and hearts are made of mother-of-pearl, with a small metal figure attached to the cross. Silver crosses and hearts are used to a slight extent. Samples of the different shapes and sizes are forwarded [and will be loaned to interested firms by the Bureau of Manufactures].

**Wages, Production, and Exports.**

The wages of the bead workmen are not very high. Those who make the beads earn from 32 to 65 cents per day. The women and girls who string them receive from 12 to 25 cents per day. As stated, the carved-shell work is practically dying out, but the demand for bead goods is in excess of the supply, and better prices are being realized all the time. The steady demand and the emigration of young men to avoid military service have led to a considerable rise in wages during the past year or two.

The declared exports of mother-of-pearl articles to the United States and dependencies during the last five calendar years have been

as follows: 1907, \$23,650; 1908, \$15,428; 1909, \$16,222; 1910, \$29,251; 1911, \$29,628. It is impossible to obtain more than a fairly close approximation of the total annual production of these goods, as many are carried away by tourists or are shipped by parcel post, and so do not enter the customs statistics or other records. Of an estimated production of from \$150,000 to \$160,000 in 1911, the principal purchasers were the United States, France, the rest of Turkey, Germany, Austria, Italy, and Great Britain, in the order named.

#### **Tools and Mechanisms Used.**

The files used are mostly of German and Belgian manufacture with some of English make. With the exception of these employed for the finest work, which are imported new, old files are brought in and recut here. Formerly this was done by hand, but a machine was recently secured from Europe for resharpening the old files. It is claimed that these resharpened files yield better results than new ones, and they are much less expensive. The borders are made locally from steel rods especially imported for the purpose. The white-metal wire for the rosaries and the silver accessories are chiefly of French manufacture. The only possible opening for American goods seems to be in connection with machinery for bead making or for a small amount of files. This consulate will be glad to receive catalogues from any firms which manufacture tools or machinery suitable for this industry; and for the convenience of American houses which might desire to import mother-of-pearl articles a list of the principal local manufacturers and dealers is forwarded [obtainable from the Bureau of Manufactures].

---

### **REVISED COMMERCIAL CODE OF JAPAN.**

American Minister Charles Page Bryan has forwarded from Tokyo a summary of the more important changes in the Japanese Commercial Code as revised by the Imperial Diet last year. This summary will be loaned by the Bureau of Manufactures. In commenting on the changes in the code Minister Bryan says:

As regards the effect on American interests, one of the most important provisions is the amendment to article 170. Formerly each of the directors of a company was entitled to represent it, even though contrary provisions were inserted in the company contract; thus it was possible for a single director to take action in regard to a company's property or other matters not in accord with the desires of the other directors. This was particularly troublesome in the case of companies composed of both Japanese and Americans. Under the new law, directors who shall act for the company may be designated either by the company contract or by a general meeting of shareholders and directors other than those so designated may not represent the company. However, if no such designation is made, each of the directors has authority to represent the company.

Articles 652-2 to 652-16 contain definite provisions regarding the right of demanding salvage money. As salvage was not mentioned in the previous code, these should be of interest to American ships. The other amendments are mainly concerned with the more minute regulation of companies, insurance, etc., and prescribe severer penalties for violation of the law. They are regarded as improvements upon the former articles and as beneficial to legitimate Japanese business interests. They will be equally beneficial to American business interests.

---

German pianos were sold abroad last year to the value of \$10,500,000 against \$9,000,000 in 1910 and \$7,900,000 in 1909.

**WORLD INDUSTRIAL NOTES.**

(Collated from European papers.)

**Increased Rand Mining Profits.**

A cablegram to England from Johannesburg states that the mines of the Witwatersrand alone (i. e., excluding outside mines) crushed during March 2,163,998 tons of ore, giving a total profit of \$6,300,969. This sum, however, includes the value of the whole of the gold reserves formerly published separately by certain of the mines, amounting to \$1,128,715. Eliminating this amount, the actual working profit for the month shows an increase over the previous month of \$319,422, the tonnage crushed being 183,602 more than for February. The average yield for March was \$6.71 per ton, as compared with \$6.87 in February; the working costs were \$4.60 as compared with \$4.66 during February, and the profit per ton was \$2.19, or a decrease of 4 cents as compared with the previous month. Compared with March, 1911, the tonnage crushed shows an increase of 203,320 tons, and the profit an increase of \$113,944.

**Research Work on India Rubber.**

Machinery is to be installed at the Manchester School of Technology for practical instruction and research work on india rubber, and the Manchester Corporation has accepted the tender of F. Shaw & Co. (Ltd.) for the supply of experimental plant for the equipment of a laboratory where research upon broad lines will be carried out. During the last two years courses of lectures have been given in the school upon the chemistry of rubber, and these are now to be supplemented by practical work.

**Scottish Emigration to Canada.**

Six vessels sailing from Glasgow in the last week of April carried 6,000 emigrants from Glasgow to Canada. As the emigrants are mostly Scottish agriculturists and artisans, this means the depletion of the country's population by about 6,000 within a week.

**New Zealand's Prosperity.**

A dispatch from Wellington says that Mr. Mackenzie, the prime minister, speaking at Auckland, said the year which ended on March 31 had been a record financially. The revenue was \$53,828,000, and the expenditure \$50,324,000, leaving a surplus of \$3,504,000, while the government investments were returning more than sufficient to pay the interest on all moneys borrowed in New Zealand and abroad. During the last few years \$3,500,000 of treasury bills had been paid off out of the revenue. Alarmists had complained of the closeness between the exports and the imports, but, as a matter of fact, during the last 20 years the exports had exceeded the imports by \$300,000,000, and the internal wealth of the country had increased by \$1,022,000,000.

**Heavy German Steel Exports.**

According to the Imperial Statistical Board the German imports of iron and steel and manufactures thereof in the first three months amounted to 163,000 tons, as against 135,000 tons in the similar period in 1911, or an increase of 28,000 tons. The exports reached 1,428,000 tons, as contrasted with 1,281,000 tons in the equivalent quarter last year, being an augmentation of 147,000 tons. These figures show on the balance of imports and exports a net gain of 119,000 tons for the first three months of this year. Pig iron represents an increase of 70,000 tons, and heavy rails one of 10,000 tons, whilst an advance also took place in joists, sheets, wire rods, railway sleepers and fishplates.

**Small Holdings in Serbia.**

In the last Skupschtina, consisting of less deputies than the present House contains, there were 52 peasant agriculturists. In respect to the last named, it is to be remarked that Serbia is essentially an agricultural State, over 80 per cent of the population being engaged in agriculture and cattle breeding. But there are in Serbia no large estates belonging to a single tenant, as in western Europe.

According to the census of 1897 there are in round figures 295,400 landed proprietors, nearly all peasants. Of these only three persons possess each more than 300 hectares of land; 80 possess from 100 to 300 hectares each; 400 from 60 to 100 hectares; 10,000 from 20 to 60 hectares; 40,000 from 10 to 20 hectares; and the remaining 145,000 peasant landed proprietors possess each 3 to 10 hectares of land. The existing system is that of small agricultural holdings. Every peasant possesses a piece of ground, however small it may be, on which he lives, and which he cultivates himself, aided by the members of his family.

**Rise in Wax Prices.**

The Scottish mineral oil companies intimated an advance of  $\frac{1}{2}$  cent per pound in the price of paraffin wax, making the basic price  $4\frac{1}{2}$  cents per pound, or 12 $\frac{1}{2}$  per cent more. It is understood that this advance is the result of a better understanding arrived at with the Standard Oil Co., while the Galician output is also declining. This advance, in conjunction with the advances recently announced in naphtha and lubricating oils, materially alters the position of the Scottish mineral oil companies for the better. The present output of paraffin wax in Scotland amounts to about 25,000 tons per annum.

**Dear English Strawberries.**

The mild weather of the early spring has hastened the development of strawberries and other fruit, and promises to make this year's strawberry harvest a notable one, provided that no severe frosts occur. Baskets of strawberries, each containing eight to nine very large berries, were on sale in London in the latter part of April at 20 cents, and the fruit had none of the flavorlessness inseparable from the forced plants.

**DURBAN'S MUNICIPAL TRAMWAYS AND TELEPHONES.**

[From Consul Nathaniel B. Stewart, Durban, Natal, South Africa.]

Durban's municipal tramways, with 32 track miles, represent an investment of \$2,150,166. The gross income in the fiscal year 1911 was \$553,360, and net profit \$80,730, or 3.75 per cent. The fare is 3 cents for each tram stage with tickets, or 4 cents cash. An extension of  $1\frac{1}{2}$  route miles is now being completed in the residential district.

Durban has the only municipal telephone system in the Union of South Africa. All others are owned and operated by the Union Government. The number of telephones in use is greater here in proportion to population than in any other town in the Union from which figures are available, the following being a comparison of several of the larger towns on July 31:

	White population.	Number of telephones.
Durban.....	32,000	1,928
Johannesburg.....	122,000	3,450
Cape Town.....	20,000	1,400
Pietermaritzburg.....	14,000	874

Durban is also the only city of the Union of South Africa which uses American telephones. All other cities use the Ericsson, a Swedish telephone. Durban's revenue from telephones in the fiscal year 1911 was \$88,162, of which \$21,384 was surplus over expenditures.

**AUTOMOBILE RACE IN ITALY.**

[From Consul Fernando de Soto, Palermo.]

An international automobile race is contemplated for May 26 and 27, 1912, under the auspices of the daily paper *L'Ora*, of Palermo, and the *Gazzetta dello Sport*, of Turin. The race, starting at Palermo, will go through Messina, Catania, Syracuse, Terranova, Girgenti, Marsala, and Trapani, finishing at Palermo, the total distance being 652 miles.

All types of automobiles are admitted, but must have at least two seats. The maximum time prescribed to cover the distance is 48 hours. Applications, which must be accompanied by 100 francs (\$19.30) should not be addressed later than May 19 to the *Direzione Giornale L'Ora*, Palermo, Italy.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8783. Silk.**—An American consular officer in the United Kingdom reports that a business man in his district has applied for the names of American silk manufacturers. Transmitted with his request is a sample of silk (obtainable from the Bureau of Manufactures), which he claims is of American origin. He also adds that he is desirous of purchasing better qualities of silk than that submitted. The inquirer states that he has been established in business a number of years, buys in considerable quantities, and is in a position to wait a reasonable time for the production of such textiles as he may wish to purchase.
- No. 8784. Automobile truck.**—A resident of a South American country has just obtained from the local Government a concession to establish an automobile service. It is proposed at present to establish two lines, 36 and 15 miles long, respectively. These routes are over a level country with a hard, chalky soil and a few sand beds. The roads are very primitive. The person holding this concession would like to get bids on a type of 3-ton gasoline truck, suitable for use on the primitive roads of the country. He will probably order one or two at first, and if the experiment is successful orders for more trucks will soon follow. Correspondence may be in English or Spanish. Prices should be quoted f. o. b. New York.
- No. 8785. Buying agent in United States.**—A large native drug company in a Far Eastern country doing a general merchandise business and having a number of branch houses, has applied to an American consulate for connections with responsible buying agents in the United States. This concern purchases upward of \$100,000 worth of foreign goods each year, mostly from England, and will, if prices, quality, and shipping arrangements are equally good, give this business to American houses. Buying agents in the United States should address this company for full particulars as to character and varieties of goods wanted and information regarding desired methods of shipping, etc.
- No. 8786. School supplies, stationery, and job-printing accessories.**—An American consul in the Far East reports that a firm in his district has bought out its competitor in that section of the country in stationery and school supplies, books, and printing business, and has accordingly extended and enlarged its business. American dealers in school supplies, stationery, and job-printing accessories desirous of doing business should address their catalogues, price lists, etc., to this firm.
- No. 8787. Electric-lighting plant.**—A municipal council in China is at present considering a proposition to install a small electric-lighting plant on an island which has a native population of 8,000 and a foreign population of about 200 persons. A plant of about 1,000 lights capacity will be ample. Full particulars may be secured by addressing the secretary of the council in question.
- No. 8788. Salted and dried fish and marine products.**—A report from an American consul in the Far East states that a city in his district imported from abroad during 1911 an aggregate of \$500,000 worth of salted and dried fish, dried shrimps, dried prawns, and bêche-de-mer. American dealers interested may secure particulars by addressing the consulate in question.
- No. 8789. Sheetings.**—A commercial agent of the Department of Commerce and Labor reports that one of the largest and most important cotton-goods dealers in Turkey is very anxious to purchase American sheetings. The qualities which are particularly wanted are 36-inch, 3.50 and 3.75 yard goods with 64-68 picks per inch. The same construction, but in all widths from 30 to 54 inches, can be sold. This is a splendid opportunity for American manufacturers to place their goods on that market. Samples and prices should be submitted with the first communications.
- No. 8790. Remnants of cotton goods.**—The members of several firms in a city of the Near East have informed one of the commercial agents of the Department of Commerce and Labor that they are anxious to get in touch with American firms selling remnants of cotton goods.

## SMOKE ABATEMENT AND FUEL ECONOMY.

[From Consul General John L. Griffiths, London.]

The International Smoke Abatement Exhibition, held in London March 23 to April 4, to show mechanical devices for abatement of the smoke evil and to develop the best methods for abating the evil, was well attended, and the papers read at the various conferences were given much space in English newspapers.

Only in the last 30 years or so has there been any systematic study of the smoke problem and any determined effort to minimize the smoke nuisance. The law dealing with the subject in the United Kingdom is the public health act of 1875. One of the speakers at the conference stated that the smoke sections of said act had mainly been so construed as to make them ineffectual, and that the only provision in the act upon which proceedings could be successfully based, in his opinion, was the one providing that "any chimney, not being the chimney of a private dwelling house, sending forth black smoke in such quantity as to be a nuisance" shall be deemed a nuisance, subjecting the offender to prosecution.

In a report of the Coal Smoke Abatement Society (under whose auspices the late exhibition was held) states that 1,000 chimneys were under observation for 12 months and that, although previously they emitted black smoke, and the proprietors stated that it was impossible not to do so, nevertheless during the time under surveillance no black smoke was perceptible. In another instance a manufacturer who had been compelled to introduce effective combustion furnaces through the continued prosecutions of the society expressed his approval of the change because of the great saving effected in his fuel bill.

### Eliminating the Smoke from Dwelling Houses.

A primary object of the exhibition was to educate the general public who have apparently been very indifferent to the injurious effects of smoke on health and buildings and also on animal and vegetable life. Half the smoke of London, it is estimated, comes from dwelling houses, the occupants of which are not liable to prosecution, and it is with regard to such buildings, as the law now stands,

that missionary work must be done if the smoke nuisance is to be effectually combated in the English capital.

A great deal can be accomplished by the use of anthracite coal, gas, patent fuel of various kinds, mineral oil, and electricity. Coal is almost universally used on British railroads, although one or more companies are now experimenting with oil fuel on locomotives, yet it is unusual for any great volume of black smoke to issue from the locomotives, the color being ordinarily white or gray; still it is claimed that yellow, gray, brown, or light-colored smoke is frequently as harmful as black smoke. Only the emission of black smoke makes a prosecution possible.

With the domestic grates, however, it is not illegal to burn the softest and smokiest coal, so that the only course open with reference to this class of offenders is to bring moral suasion to bear upon them and to educate the householder to a realization of the injury caused by smoke and the benefits in the way of cleanliness, improved health, and greater economy that would result from its elimination. The use of improved combustion grates and of harder coal fuels or of gas or electricity would soon cause a great lessening of the nuisance. The average English householder, however, is strongly attached to the open glowing coal fire.

#### **Extending Use of Gas Appliances.**

There is, however, an increasing use of gas heating, cooking, and hot-water appliances throughout the country. There has been a marked increase in the number of these appliances sold, hired, or loaned to consumers by gas companies in and near London.

While 46,000 of such appliances were in use in 1891, 445,000 were in use in 1901, 998,000 in 1906, and 1,494,000 in 1911. The figures show that nearly 1,500,000 chimneys, which would otherwise be sending forth black smoke and dirt, no longer constitute a nuisance, and the number is being added to at the rate of nearly 100,000 each year.

The efforts of the Coal Smoke Abatement Society, in greatly reducing the volume of smoke, have been instrumental in making black fogs rare in London. A few years ago these fogs were quite frequent in London in winter, and for several days at a time the city itself and the outlying suburbs were covered by a dark, black pall, sometimes high in the air, but more frequently descending and forming a thick, dirty, and greenish-yellowish substance through which the people had to travel. Fogs still occur in London, but only occasionally, and not for several years has there been an old-fashioned fog when torch bearers had to be employed to indicate the way.

#### **Efforts of Cities and Manufacturers.**

In many English cities an effort is being made to deal systematically and scientifically with the smoke problem. In Sheffield, for example, the steel manufacturers have appointed a committee to investigate the possibilities of replacing the furnaces now generally in use with gas and electrically heated furnaces, while in London, Glasgow, Liverpool, Manchester, and other industrial centers, classes have been successfully held for educating stokers as to the best method of doing their work.

It was claimed at the conference that cheap bituminous coal could be used in a well-designed and carefully operated boiler installation without injurious effects from the smoke.

**Production of Transportable Heat Units in the Mine.**

The feature of the conference was the presence of foreign delegates, and it was evident that English appliances and methods of attacking the smoke problem have attracted widespread interest. Sir William Ramsay, in an address, said it did not seem impossible that a shaft could be sunk to the coal-bearing strata, admitting sufficient oxygen necessary to burn the coal and that the gas thus produced could then be drawn off to be utilized for creating electrical power at the "pit head," from whence it could be distributed. In this way, he claimed, coal mining and coal smoke could be entirely done away with by converting coal into gas in the bowels of the earth. Among the resulting advantages he mentioned that electrical power for railroads and industries could be obtained at one-fifth, and possibly one-tenth, the present cost; that domestic lighting and heating could be supplied at a mere fraction of the ordinary present expenditure; that a saving of fuel would prolong the life of the coal fields almost indefinitely; and that the number of employees would be greatly reduced, as practically only the services of skilled mechanics would be required.

An English colliery owner has agreed, according to the newspapers, that Sir William Ramsay should make the experiments on a small scale at his mines, which will be done this summer. Should it prove successful, "a candle," Sir William Ramsay said, "will be lighted in England which will not be extinguished in our time."

**Plans for the Experiment.**

The method of carrying out the experiment is to put down a bore hole about  $1\frac{1}{2}$  feet wide in a practically worthless stratum of coal. A tube would be inserted to keep the hole free from water. There would be three concentric tubes—the inside, middle, and outside. Air being forced down the outside tube, the coal would burn and gas would be brought up in the middle tube, or space between the middle and inside tubes. With a blazing fire below, the coal would slowly spread and distill and producer gases would be brought up. A high-tension electric current produced by means of the gases could be generally distributed.

A seam of coal must now be  $2\frac{1}{2}$  or 3 feet deep before it can be successfully worked, but under the new plan it need not be more than a foot thick, and could be half shale.

**Timely Subjects Presented.**

Among the various phases of the subject of smoke pollution and abatement the following were dealt with by speakers at the conference and lectures held during the exhibition:

**1. Smoke pollution; its economic and artistic effect.**

(a) "The action of coal smoke on building stones and mural paintings," in regard to which it was calculated several years ago by a scientist that the sulphur present in the coal annually burnt in London gave off oxidized sulphur compounds corresponding to half a million tons of sulphuric acid. St. Paul's Cathedral furnished a striking example of the destruction so wrought. There was a blackish stalactite incrustation hanging to the underside of the cornice above the colonnade and below the dome; this was some inches deep in places, and contained nearly 74 per cent of gypsums or hydrous calcium sulphate.

(b) "The influence of smoke on decorations," in which it was pointed out that a coating of soot and dirt on paint work acted as a sponge, keeping the surface bathed in what was really a dilute solution of sulphuric acid; paint being permeable to moisture, this acid penetrated the film and attacked the material behind.

(c) "Effects of town air on metal work," in which various means of protection were mentioned, such as the application of lacquer, the principle of guarding by a more electropositive metal, and plating with nickel. But the real cure remained in the abolition of coal and coke and substituting gas.

### 2. *Effects on animal and plant life.*

(d) "Sunshine records." The superintendent of the forecast division of the Meteorological Office pointed out that the average loss of bright sunshine in London on account of smoke amounted to 38 per cent for the city proper and 36 per cent for Westminster. There was, however, a steady improvement, the winter sunshine in London having nearly doubled during the past 30 years.

(e) "The smoke nuisance at Kew Gardens," wherein it was remarked that since action had been taken with regard to certain neighboring factories much improvement had manifested itself, the worst offenders now being the steam tugs. Nothing is more disheartening to the cultivator than the deleterious influence of smoke; if that be removed, plants could be made to flourish at Kew and in the larger London parks as in country places.

(f) "Effects of smoke pollution on vegetation," in which the result of observations in and near Leeds showed that the smoke cloud shut off 40 per cent of sunshine, and this deprivation was rendered worse by the thick deposit of soot upon the leaves of plant life, blocking out their vital energy; the film of dirt, oily in character, choked the breathing pores of plants, tending to suffocate them. Firs and pines especially suffered, some planted in Leeds being killed in three months.

### 3. *Smoke abatement.*

(g) "The smoke problem in the United States," contributed by an American, wherein the different kinds of fuel obtaining on the American railroads were described, together with the steps taken to cope with the smoke nuisance, and how, in a certain State, the original law had, by constant amendment, become practically nullified until, in 1907, a vigorous crusade was entered upon, with the result that the smoke annoyance has now been greatly reduced. The author expressed the opinion that oil fuel is not used economically, but is as largely wasted as coal. When science has attacked and solved the problem, oil would be the fuel of the future.

(h) "Recent progress in the campaign against black smoke" (in Great Britain), in which were detailed the different exhibitions which have been held, commencing with that in London in 1905, and followed by those at Sheffield (1909), Glasgow (1910), and Manchester (1911), the greatest educational success having been attained in Glasgow, where the exhibition remained open for three weeks and attracted an average daily attendance of 4,000. With regard to the Coal Smoke Abatement Society in London, it was pointed out that during 1910 the number of cases of smoke pollution observed by the society's inspector and considered by the committee amounted to 1,064. The general course when an obvious nuisance was observed was to place a complaint with the borough council or other local authority concerned. Where, however, it was reasonable to believe that the smoke pollution detected was either accidental or due to a temporary breakdown, a friendly letter was sent drawing attention to the matter, and action of this kind, it was reported, was appreciated by manufacturers. With an income of only \$973 per annum, much had been accomplished by the society, and in addition to showing that smoke abatement is possible, it has been proved to manufacturers that in most instances striking economy can be effected by using the means of modern research for securing the maximum advantage from bituminous coal, while, by using smokeless methods of heating and cooking, the householder can aid in cleansing the atmosphere. The greater use of gas and electricity in place of coal was strongly advocated.

(i) "Smoke abatement from the inspector's point of view." The author was the chief smoke inspector at Sheffield, who pointed out that in 1890 the boilers and furnaces of the city were belching forth day and night black smoke. Action was taken and the smoke-abatement law which had been on the statute books for 15 years was enforced. There was resentment at first, particularly among stokers, who believed that the more smoke the more steam. They were, however, instructed as to the proper way of firing the furnaces so as to prevent the formation of smoke, with the result that a greater quantity of steam was generated, less coal consumed, and dense smoke eliminated.

The regulations as to the issuance of black smoke are as follows: One boiler, 2 minutes per working hour; 2 boilers, 3 minutes; 3 boilers, 4 minutes; 4 boilers and more, 6 minutes. If the regulations are twice violated, police court proceedings can be instituted and fines imposed. Sheffield in 1907 had 1,428 hours of sunshine (more than any other large city or town in the United Kingdom), being 273 hours in excess of the average for the large cities of the United Kingdom. This transformation is

claimed to have been due to the adoption of a common-sense and scientific method of feeding furnace fires. The creation of a Government "smoke department" was urged.

(j) "Wasteful power production; waste due to smoke," in which it was stated that, owing to the conditions of combustion in the ordinary domestic grates, domestic smoke contained about 25 per cent of tarry matter, and there was a probable loss in soot of 5 to 7 per cent of the total weight of fuel burned. In factory smoke it would average 0.25 to 1 per cent. The quantity of coal consumed in the United Kingdom in 1909 was approximately 177,000,000 tons, and if an average loss in soot be taken at 2 per cent, over 3,500,000 tons of fuel were wasted. It was further pointed out that with boilers and heat conductors coated with soot the rate of heat transfer was reduced, amounting to as much as 15 per cent for a layer of soot only one-twentieth inch thick.

(k) "Proposed legislation." At present there is no universal prohibition against all manufacturing smoke, and certain classes are exempt from legislation under existing acts. It is proposed to permit exemptions from an absolute rule in regard to particular chimneys for a limited period, to be renewable for 2 years, but not exceeding 10 years in all, when it is believed it will be more apparent what the next step should be. Pressure should be brought upon accidental emissions or through breakdowns. Penalties should be heavier and increase twofold on each successive conviction. Well-trained, scientific men, having technical knowledge of the furnaces they inspect, should be appointed as inspectors. A smoke department should be created in the local government board, but no interference with local bodies, which are now doing good work, should be allowed, and where certain cities possess their own acts, the provisions thereof would be made an addition to, and not a repeal of, regulations now existing.

#### **How Technical Men Can Help.**

At this exhibition, the gas engineer demonstrated that the architect could aid in the endeavor to ally utility with artistic surroundings. A large number of gas heating stoves were on view in the center of the hall, which attracted the attention of visitors by the neat-looking fireplaces and artistic style in which they were arranged. The arguments used in favor of gas were that the conversion of coal into gas, plus coke, tar, sulphate of ammonia, and many other valuable by-products, is a considerably more economical and hygienic method of using coal than by burning it in grates and kitchen ranges which pour out a large proportion of the by-products into the atmosphere, to its detriment.

Electrical engineers occupied the whole of one of the inner halls, which was fitted up with examples of electric cooking and heating appliances, including a restaurant where everything was cooked by electricity, and a model laundry was also entirely worked by electricity.

#### **The Average Soot Fall.**

According to The Lancet, "The estimated fall of soot on the administrative county of London amounts to 76,050 tons per annum, this including 6,000 tons of ammonia, 8,000 tons of sulphates, and 3,000 tons of chlorine combined as chlorides." This is equal to a soot fall on each inhabitant of 25 to 35 pounds per annum. To illustrate what this mass really meant, a group of models was exhibited at the exhibition consisting of a center model of Cleopatra's needle (17 feet high), representing the volume of soot, and another of the Parliament clock tower, to show the space occupied by the comparative structures—both of which were prepared to scale—and it is almost needless to add that the former far exceeded the latter.

#### **Wide Range of Exhibits.**

Among some of the principal exhibits the following may be mentioned: A patent furnace, applicable for steam boilers, locomotives,

steel reheating furnaces, brewers' coppers, etc., which, it is said, can be instantly regulated to burn slack, smudge, refuse, ashes, sawdust, coke, and the smallest coal. By a patent bar bridge the smoke nuisance is said to be effectively dealt with. Some of the advantages claimed were: The evaporation of more water per pound of coal than any other furnace; the upkeep is practically nil, the fire bars being indestructible; clinker does not stick on the grate bars; freedom from smoke nuisance; high chimneys are not necessary; and increased power can be instantly obtained and the fires of a banked boiler more readily put into operation.

A manufactured powder displayed, when dissolved in water and sprayed on coal, utilizes the waste products—smoke, soot, and gases—by burning them, causing the coal to last longer, burn brighter, and with intensified heat. A 1-pound tin (cost 36 cents) is sufficient for 1 ton of coal, and is said to save 30 per cent on the coal supply.

Numerous patent fuels were exhibited, and at one stand solid petroleum briquets were shown, manufactured from coal and crude hydrocarbons by the use of which smoke is abolished and economy is practiced; it was also stated that the briquets act as a disinfectant, while the calorific value is given as 14,500 British thermal units—equivalent to pure carbon. Another was also exhibited and stated to be cleaner than coal and smokeless. In order to radiate equal quantities of heat with coal and this fuel,  $2\frac{1}{2}$  pounds of the former is required, as compared with 1 pound of this tarless fuel. A further patent fuel was shown which it was claimed would burn up the smoke, last twice the time of ordinary coal, and could be used with success in anthracite stoves, suction gas plants, and open grates. Anthracite coal also, in various screened sizes, from the Swansea Valley coal fields, was exhibited, together with anthracite stoves of different types.

#### **Gas Stoves and Ranges.**

The different gas companies in and around London combined to make an effective exhibit, with the view of proving the uses and value of gas for heating and cooking as well as for lighting purposes. Many of the leading manufacturers displayed the latest types of ranges, cookers, and heaters.

A stove was exhibited which can be used either as an open slow-combustion sitting-room grate, or can be immediately converted into a range and oven, capable of cooking for 8 to 10 persons, while the high-pressure water boiler can be heated whether the oven or the open fire is in use. It was stated that these stoves have been quite generally adopted in several "garden cities."

#### **Legal Restrictions in Europe and America.**

At the instance of the Coal Smoke Abatement Society the British Foreign Office in 1905 issued a series of reports in which were set forth the laws in various countries in reference to the emission of smoke. It was shown that Great Britain in the matter of legislation was far in advance of most of the other countries. No general law has been adopted in France. There is an "ordonnance" in Paris which forbids the prolonged emission of thick black smoke, but little effort has been made to enforce this municipal regulation. It is provided in Germany that care should be taken in all works under State control that the emission of black, thick, and continuous smoke

be avoided. It will be thus seen that there is no general law on this subject, but some of the German cities have taken the initiative on their own behalf. For example, in all manufacturing and industrial premises in Dresden the furnaces must be so constructed and stoking so regulated that no smoke containing visible particles of soot shall be constantly emitted. This ordinance or regulation was adopted in 1887 and later its provisions were extended to residences by an enactment that "in private dwelling houses the heating arrangements must be so contained as to produce as little smoke as possible."

Apart from the civic or State regulations in Philadelphia, Chicago, Massachusetts, and Ohio, which need not be detailed, mention may be made of the by-law passed by Toronto in 1907, which enacts that—

No owner, lessee, tenant, agent, manager, or occupant of any premises or steam engine in which a fire is burned, and no person who operates, uses, or causes or permits to be used any furnace or fire within the limits of the city of Toronto, shall permit the emission to the atmosphere from such fire of opaque or dense smoke for a period of more than six minutes in any one hour \* \* \* any person convicted of a breach \* \* \* shall forfeit and pay \* \* \* a penalty not exceeding \$50 for each offense, and in default of payment \* \* \* and costs forthwith \* \* \* may be levied by distress and sale of the goods and chattels of the offender, and in case of there being no distress found out of which such penalty can be levied, the offender may be committed to the common jail, \* \* \* with or without hard labor, for a period not exceeding six calendar months.

#### Proposed British Investigation and Law.

The Coal Smoke Abatement Society is urging the appointment of a royal commission to inquire generally into the subject of smoke emission for the purpose, if possible, of having a stringent general law passed by Parliament. Almost 70 years have passed since there has been any general inquiry into the matter in Great Britain, and it is believed, in view of all that has been accomplished in the meantime, that such a commission would render invaluable aid through its suggestions and conclusions to the cause of smoke abatement. In a paper read before the Coal Smoke Abatement Society, it was suggested that the royal commission, if appointed, should be directed to inquire:

- (1) What standard, if any, is desirable as to the color or density of the smoke which should be deemed a nuisance.
- (2) How the color or density of smoke can best be identified. (At present a variety of methods are employed, none of which is altogether satisfactory, and some uniform rule is urgently required.)
- (3) Are the fines at present inflicted upon offenders sufficiently adequate to act as deterrents?
- (4) Who should be punished, the owner of the works, the engineer in charge, or the stoker, when smoke nuisances result from careless manipulation of well-equipped installations?
- (5) Should any industries receive special treatment?
- (6) Should Government inspectors be appointed to act in regard to the emission of smoke as is done in the case of the alkali acts?
- (7) Should Government premises be placed under the obligation to prevent smoke nuisances? (At present they are immune from prosecution.)
- (8) Ought any hourly or other time limit to be fixed during which the emission of black or other smoke may fairly be permitted to issue from factory shafts? (At the present time limits fixed by various municipalities vary between 3 minutes and 15 minutes in the hour.)
- (9) Should all cases be heard by stipendiaries (paid magistrate)?
- (10) Can the issue of an unreasonable quantity of smoke be prevented except in the case of breakdown or accident?
- (11) Can it be shown that the installation of proper appliances generally results in economy, as is contended by "smoke abaters."

- (12) The incidence, intensity, and duration of fogs and their effect on health.
- (13) The influence of smoke on health.
- (14) The damage of smoke to buildings, works of art, and property generally.
- (15) Foreign efforts to cope with the smoke nuisance.
- (16) How far it is possible by smoke abatement to conserve our coal supplies.
- (17) How far it is practicable to deal with smoke from private dwelling houses.

A copy of the official catalogue of the International Smoke Abatement Exhibition, a pamphlet on "Smoke Abatement," and copies of various descriptive pamphlets relating to many of the exhibits, etc., have been forwarded [and will be loaned to those making application to the Bureau of Manufactures at Washington].

### NOTES FROM SIAM.

[From Vice Consul General Carl C. Hansen, Bangkok.]

#### Land Banks—River Survey—Waterworks Tenders.

A representative of a Belgian syndicate of capitalists recently visited Siam with the object of establishing land banks. It is proposed to lend money in reasonable amounts to cultivators of land at the rate of 9 per cent. The Siamese are said to regard this plan favorably.

The Hydrographic Department of the Siamese Navy has begun a survey of the mouth of the River Menam Chow Phya, which is the most important river in Siam and on which Bangkok, the capital of the Kingdom, is located, about 20 miles from its mouth.

Tenders for the construction of ferroconcrete settling tanks and filtered-water reservoirs were invited on March 22, 1912, but the time limit was so short that only local firms were able to bid.

#### Successful American Bidder.

Tenders for the supply and erection in Bangkok of an electric power station of 3,000 kilowatts were opened on March 15, 1912. Fourteen bids were received, and the combined tenders of the Allgemeines Electricitats Gesellschaft (Germany), British Thomson-Houston Co. (England), and General Electric Co. (United States), have been accepted. These amount to \$229,212.

The Allgemeines Electricitats Gesellschaft will install the turbo-generators with condensers. There will be three of these, with a total capacity of 3,000 kilowatts, 3-phase, 50 cycles, 3,500 volts. This is the same system as that employed by the Siam Electricity Co. (Ltd.). The turbines are to be of the Curtis horizontal type, direct connected to the generators, and running at 3,000 revolutions per minute. The British Thomson-Houston Co. will supply the switch gear and the General Electric Co. the transformers. Eight Babcock & Wilcox boilers, each with a heating surface of 4,000 square feet, and able to burn husk, oil, or coal, will be used. The station must be ready within 18 months from the date of signing the contract.

### GERMAN INDUSTRIAL INVESTMENTS.

[From the Frankfurter Zeitung.]

The amount of fresh capital invested in industrial enterprises in Germany during the first quarter of 1912 was \$102,500,000, as compared with \$77,250,000 in the corresponding period of 1911. The following approximate amounts were invested in the more important branches: Banks, \$33,000,000; engineering, \$15,000,000; electrical and gas, \$10,300,000; mining, foundries, etc., \$9,000,000; chemical industries, \$4,500,000; building trades, \$4,000,000; textiles, \$2,750,000.

**ANNUAL AUTOMOBILE EXHIBITION IN BOHEMIA.**

[From Consul Joseph I. Brittain, Prague, Austria.]

The ninth annual Automobile and Motor Cycle Exhibition of the Bohemian Automobile Club of Prague was held in the exhibition buildings, April 7 to 15, 1912. The leading officials were present at the opening exercises, including the vice governor of Bohemia.

The number of cars exhibited has been yearly increasing, until this time there was little unoccupied space. Among the leading exhibits were the following cars: The Benz, of various types, including a large heavy dray wagon; machines manufactured by the Českomoravská Továrna na stroje (Bohemian Moravian Machine Works of Prague), which cars are considered as belonging to the better type manufactured in Bohemia; the Laurin & Klement, of Jungbunzlau, Bohemia; the Raf, of Reichenberg; and the Puch, of Gratz. Other cars were the De Dion-Bouton, Mercedes, Stower, Scat, Austro-Daimler, and the Minerva. The agent for the Ford cars reserved a space in the exhibition building, but his cars did not arrive in time for display. The Studebaker Co., through its agent at Aussig, Bohemia, occupied a prominent place with three cars of the medium grade.

**Preferences in Finish and Style.**

Thus far the American manufacturer of high-grade cars, such as would sell for \$4,000 to \$5,000, have failed to take sufficient interest in this market, where the Italian, French, Belgian, and German builders are selling some fine cars. The manufacturers of European cars, and especially those made here, devote much time and care in constructing bodies along graceful lines, avoiding as far as possible sharp or square corners. Especial care is also taken in rubbing down and filling the woodwork before painting. The impression prevails here that American cars are more cheaply finished, but finer ones are not exhibited. Whenever manufacturers of American cars take as much interest in this growing market as do manufacturers of other foreign cars, their sales will increase, but people will not purchase cars from photographs.

**Large Sales of American Tool Machinery.**

For the first time there was exhibited a fine line of American tool machinery, representing the leading builders of such machinery in various parts of the United States. There were two large displays under the direction of experienced machinists. The displays were both supplied by power, thus enabling the various machines to be shown in operation. The two exhibits, one made by Schuchardt & Schütte, and the other by Ernst Krause & Co., of Prague, represented a value of about \$50,000. These exhibits occupied ample space in prominent positions, and attracted much attention. I was informed that the annual sale of American tool machinery in Bohemia will exceed \$2,000,000.

During the second week in April, 1913, there will be an automobile exhibition on a more extensive scale.

---

Consul Hunter Sharp reports the launching at Belfast on April 24 of the 6,700-ton *Laomedon* for the China Mutual Steam Navigation Co. It is constructed on a special girder system which provides unobstructed cargo space in the holds.

## WHOLESALE PRICES IN CANADA.

[From Consular Agent Sydney F. Culver, Fredericton, New Brunswick.]

Wholesale prices in Canada reached during 1911 a general level higher than in any previous year within the present generation. The statistical record of the Department of Labor shows that since 1890 prices have only once approached a high point comparable with those of last year, namely, 1907.

The year was one of general trade prosperity and industrial expansion in Canada. The heavy immigration movement, the very pronounced activity in railroad construction and other building operations, the enlarged outputs of manufacturing establishments, and the increased volume of trade, foreign and domestic—in which field the returns of the year uniformly indicated a very marked advance over those of 1910—all united in causing an exceptionally keen demand for materials, hence the increase in prices.

In foodstuffs the unfavorable crop returns of the summer and autumn months worked similar tendencies. Grain advanced sharply, and the decline in live animals and meats was attributed to feed shortage. Imported foods, including sugar, were on decidedly higher levels. The financial tone was good, and the production of gold was the highest recorded.

**The Rise and Decline of Various Commodities.**

The general level of prices in the several groups in 1911, expressed in percentages of the increase or decrease when compared with 1910, is shown in the following table as given in the report of wholesale prices by the Department of Labor:

Groups.	Increase or decrease.	Groups.	Increase or decrease.
	<i>Per cent.</i>		<i>Per cent.</i>
Grains and fodder.....	+ 5.8	Hides, leather, boots and shoes:	
Animals and meats.....	-10.2	Hides and tallow.....	+ 6.0
Dairy products.....	- .9	Leather.....	+ .2
Fish.....	+ 1.5	Boots and shoes.....	- .4
Other foods.....	+11.8	Fuel and lighting.....	- .8
Textiles:		Building materials.....	+ 3.0
Woolens.....	+ 4.9	Miscellaneous:	
Cottons.....	+ .5	Furs.....	+ 7.4
Silks.....	- 1.6	Liquors and tobaccos.....	+13.8
Flax products.....	+ 7.2		
Jutes.....	+33.6	All commodities.....	+ 2.7

The 1911 apple crop sold at considerably lower prices up to the close of the year than prevailed during the corresponding period of 1910. A common price to the grower in carload lots was \$2 a barrel for winter apples. Small growers, however, received as low as \$1.50 per barrel, whereas some of the Ontario cooperative associations obtained \$2.75 to \$3 for good stock. Peaches were a good heavy crop and showed a material advance over 1910. Pears were a short yield, and the prices were higher than in the preceding year.

**Vegetables, Flour, and Lumber.**

The feature of the movement in vegetables was the high price of potatoes, which sold at \$1.24 a bushel, compared with 58.3 cents in 1910. Crop failure in Ontario was the leading cause. Canadian red onions also rose from \$1.29 in 1910 to \$2.06 in 1911. With canned

vegetables the autumn prices in 1911 were considerably higher than in 1910. Canned corn, standard 2's, which averaged 86 cents in 1910, was \$1 last year. Peas, standard 2's, were \$1.09 in 1910 and \$1.33 in 1911.

Taking the year as a whole flour prices were lower than in 1910. Oatmeal, after a drop in the spring months, recovered in June and rose rapidly in the autumn, prices being 5 per cent higher than in 1910. Coffee advanced rapidly in November and December, the increase being attributed to delay in the crop movement and market manipulation.

The record of the Department of Labor indicates a somewhat higher general level of prices in lumber for 1911 as a whole than for 1910. The advance of the yearly average was largely due to the continued rise in the high grades of pine; laths were also upward, as was soft maple in Toronto. The lower grades of pine and maple were cheaper than in 1910. The average price at which the entire cuts of several mills in the Ottawa Valley were sold was estimated to be slightly below that of the preceding year—\$20 per thousand as compared with \$20.50 in 1910. New Brunswick spruce deals were lower, but shingles from this Province were higher. The same situation developed in the West.

---

### A CANADIAN HYDROGRAPHIC EXPERIMENT.

[From Consul Henry S. Culver, St. John, New Brunswick.]

The St. John River, which empties into the Bay of Fundy at this city, forms in its upper reaches the boundary between Maine and New Brunswick. For many years there has been more or less acute trouble each spring between the lumbermen on the two sides of the river about the difficulty of separating the logs belonging to the various owners. Attempts have been made, more or less successfully, to hold up the logs until they are sorted, but of recent years, according to the usual practice of rivers running through deforested regions on this continent, the spring freshet water of the St. John has been allowed to flow out very quickly, so that by the time the work of sorting is completed the logs are stranded for lack of water to float them.

An attempt is to be made to get over this difficulty by building dams and reservoirs for regulating the flow of the river and prolonging its capacity to float logs down to any desired point. The whole matter has been under investigation by a mixed commission made up of two representatives of Maine and New Brunswick, with the aid of scientific experts. The plan involves 20 dams at a cost of about \$1,000,000. However, there is always a danger of one of the series of dams breaking away and allowing a fierce flood to bring an enormous pressure to bear on the dams lower down. It may yet be found necessary to hold back at least part of the freshet water in the tributaries of the river so as to lessen the risk of delay through collapses of dams in the main stream.

---

Consul Albert Halstead reports that the total value of declared exports to the United States from the Birmingham, England, consular district for the first quarter of 1912 was \$957,577, a loss of \$73,329 as compared with the similar quarter of 1911.

**BRITISH INDUSTRIAL NOTES.**

[From Consul Benjamin F. Chase, Leeds.]

**Extension to Gas Plant—Largest Canal Boat.**

The Doncaster Corporation has applied to the Local Government Board for power to borrow \$160,594 for extensions to the gas works.

The largest canal boat ever built in Leeds was launched recently by its owners, a firm of coal merchants. The boat, constructed of English oak, is 62 feet long, with a 14 foot 8 inch beam, draws 5 feet 6 inches of water, and has a carrying capacity of 100 tons of coal.

**New University Building—Coast Lookout Stations.**

An additional building for the textile department of Leeds University, erected from a gift of \$24,332 by the Clothworkers Co., will be formally opened April 26. The Clothworkers Co. has donated to this branch of the university a total of \$364,987 for buildings and equipment.

The Board of Trade is making preparations for more lookout stations on the Yorkshire coast to warn ships of derelicts, etc. The plan is to erect watch sheds or shelter huts in exposed places on promontories, to be occupied in bad weather by coast-guard watchmen. They are to be connected with the nearest coast-guard stations by telephone.

**Dead-Letter Reorganization—Fisheries.**

Leeds is the dead-letter office for an area including 37 towns and the greater part of Yorkshire. A staff of eight attend to this work. A new plan is being formulated to have a dead-letter department in each independent head office. This will insure quicker delivery and will reduce the work in Leeds to about one-third its present rate.

Local newspapers give extracts of a report made to the North-eastern Sea Fisheries Co., which controls the fishing on the North Sea along the shores of Durham and Yorkshire from Sunderland to Grimsby. The report shows the value of fish landed in 1891 to have been \$8,723,021, and in 1911, \$18,203,698. The weight of wet fish landed was: 1891, 2,088,551 hundredweight; 1911, 5,904,865 hundredweight. Of these, 169,784 hundredweight in 1891 and 189,844 hundredweight in 1911 were from towns in the Leeds consular district extending from Redcar to Filey. There are now 17 steam trawlers, all short-voyage vessels, working regularly from Scarborough, the chief fishing port in this district.

**Clubs and Homes for Working Girls.**

The Leeds Association of Girls' Clubs has a membership of 1,200, all connected with either a church or a chapel. Payment of 2 cents a week gives the rights of the clubs to girls, with free instruction in dressmaking, laundry work, knitting, cookery, needlework, swimming, drilling, etc. An annual exhibition is held, when prizes are competed for by the various branches.

A new home for working girls was recently opened by the Leeds branch of the Girls' Friendly Society. A house formerly used as a vicarage has been redecorated and refitted. It will accommodate 25 boarders and about five times as many day girls. There is a large open space and garden at the rear. The interior includes a lounge or rest room for reading, writing, and study; a recreation room for games, classes, meetings, etc.; an office, which will also serve as an employ-

ment registry bureau; and several bedrooms. A restaurant with a separate entrance will furnish meals to girls at very low prices. This is the first lodge to be opened in Leeds. The first in England was established in 1875, and now there are between 60 and 70 in England and Wales. That at Birmingham has 80 boarders and served 33,000 dinners last year.

### HAWAIIAN BUSINESS NOTES.

[From the Honolulu Bulletin.]

*The Commercial Museum of Japan* at Honolulu was opened to the public early in April.

*New vessel.*—A million-dollar steamship for the Puget Sound-San Francisco service is now planned.

*Hospital.*—A home for consumptives may soon be established in Hilo. Dr. Sexton, president of the board of health Pratt, and secretary of the Territory Mott-Smith are planning the proposition.

#### Hawaiian Coffee for the Army.

Honolulu merchants have been given an opportunity to bid on furnishing 30,000 pounds of coffee per month for the Army in the Philippines, which is in addition to the purchase in this market of about 5,000 pounds of Kona coffee per month for the local Army forces.

[Statement of Brig. Gen. Henry G. Sharpe, Commissary General of War Department, Washington.]

An order has been placed for one shipment of 35,000 pounds of coffee to the Philippines from Honolulu, and the Chief Commissary, Philippines Division, has been asked to report on the condition and quality of the coffee with a view to determining whether further shipments shall be made from Honolulu. The price quoted the Department, 24½ cents per pound, is 1 cent cheaper than the lowest quotation in San Francisco for coffee of this type.

### NEW GOVERNMENT PUBLICATIONS.

The following recent publications of the Department of Agriculture may be had at the prices affixed from the Superintendent of Documents, Government Printing Office, Washington, D. C.:

Technical drug studies by Division of Drugs; Examination of hydrogen dioxid solutions; Purity of glycerin; Notes on two important alkaloidal reactions; Separation and identification of small quantities of cocaine; Determination of molybdic trioxid; A method for testing ammonium salts; Character of samples of beeswax submitted with bids. Pp. 51. (Bulletin 150, Bureau of Chemistry.) Price, 10 cents.

Chemical analysis and composition of imported honey from Cuba, Mexico, and Haiti. Pp. 21. (Bulletin 154, Bureau of Chemistry.) Price, 5 cents.

Wood-using industries and national forests of Arkansas: Part 1.—Uses and supply of wood in Arkansas; Part 2.—Timber resources of national forests in Arkansas. Pp. 40. (Bulletin 106, Forest Service.) Price, 5 cents.

Highway bridges and culverts. Pp. 21, pls. 14, figs. 3. (Bulletin 43, Office of Public Roads.) Price, 15 cents.

Pasteurization of milk. Pp. 44, figs. 32. (Circular 184, Bureau of Animal Industry.)

Rules and regulations for enforcement of the food and drugs act. Pp. 20. (Circular 21, revised, Office of the Secretary.) Price, 5 cents.

Adulteration and misbranding of red clover, Kentucky bluegrass, orchard grass, and hairy vetch seeds. Pp. 7. (Circular 39, Office of Secretary.) Price, 5 cents.

A *Linoleum Merchants' Association* has been formed in Germany, headquarters Leipzig, to further the trade and assist linoleum merchants in their negotiations with linoleum factories. The Linoleum Merchants' Union, of Berlin, Dresden, Frankfort, Cologne, Leipzig, and Munich, immediately joined the new association.

**INCREASING STREET ACCIDENTS IN UNITED KINGDOM.**

[From Consul General John L. Griffiths, London.]

The statistics of street accidents in the United Kingdom during the calendar year 1911 show how rapidly mechanically driven vehicles are being introduced into the country. The accidents in 1911, fatal and nonfatal, aggregated 35,210, as compared with 31,077 in 1910. There were 1,557 fatal street accidents last year, of which 684 were caused by horse-drawn vehicles and 873 by those which were mechanically propelled. The number of fatal accidents in 1910 was 1,327. Horse-drawn vehicles were responsible for 655 of such accidents and mechanically driven vehicles for 672.

A far greater number of accidents, not resulting in death, were due to mechanically propelled vehicles than to horse-drawn vehicles. Of a total of 33,653 nonfatal accidents, 13,427 were due to horse-drawn vehicles and 20,226 to mechanically driven vehicles. In 1910 the respective figures were 13,622 and 16,128, which show that there were fewer nonfatal accidents in 1911 caused by horse-drawn vehicles than in 1910, but a very large increase in those caused by mechanically driven vehicles.

---

**JAMAICA-CANADA LINE.**

[From Consul Julius D. Dreher, Port Antonio.]

A resolution by the Legislative Council approves negotiations by the Government of Jamaica for a weekly steamer service between Jamaica and Canada, in conjunction with an island coastal service, for 10 years at a subsidy of \$100,000 per annum.

So far as can be determined from Kingston papers, it appears that the proposed line is to run in connection with the Canadian Pacific Railway and that during the winter months the ships would touch at Boston. The ships are to be of some 7,000 tons each, with accommodations to carry about 70,000 bunches of bananas on each trip to Canada.

---

**AMERICAN ROAD MACHINERY FOR HONDURAS.**

[From Consul A. T. Haeberle, Tegucigalpa.]

After considering the question of purchasing road-making machinery for some time, the Government of Honduras recently placed in the United States an order for a complete outfit—engines, rock crusher, and cars. Work will probably be begun as soon as the machinery arrives. The present administration has been repairing the cart road from San Lorenzo to the capital and hopes to build a new road to Olancho and also repair the old road to Comayagua, the greater part of which is abandoned at the present time.

---

**Agricultural Science in High Schools.**

The new Government bulletin on "Agricultural Education in Secondary Schools," will be sent free upon request to the Commissioner of Education, Department of the Interior, Washington, D. C. Among the topics covered in the Bulletin are the following: Essentials in a State system of agricultural education; the need for reliable scientific data regarding the rural problem; and the proper equipment of an agricultural high school.

## NOTES FROM RUSSIA.

[From Consul John H. Grout, Odessa.]

**Russian Beans and Peas.**

Of late there has been an increasing demand from the United States for Russian beans and dried peas. Large shipments have already been invoiced through the Odessa consulate, the rapidity of the growth of this trade being clearly shown by the declared export totals of the last two years, which were: 1910—beans \$928, peas nil; 1911—beans \$4,337, peas \$112,025.

This trade, however, has not been devoid of unsatisfactory results. Complaints have come from the United States to the effect that the goods received have not been up to sample and in some instances have been unsalable. Much of this trouble has been due to the fact that proper contracts have not been drawn up to protect the interests of those concerned. There are reliable dealers here and also unreliable ones. Several cases referred to this consulate for investigation have had to be turned over to local attorneys for adjustment. This means long delays and expense for American buyers, not to speak of annoyance and inconvenience.

As a rule, the Russian seller demands that a confirmed letter of credit be placed with a local bank against which he can draw immediately upon shipment and the production at the bank of a certified consular invoice. If the seller ships goods according to sample, all goes well; but should he send inferior goods, he gets his money just the same and the American buyer has to suffer. Happily, dissatisfaction is not always the case, but it is suggested that prospective purchasers protect themselves by placing with proper authorities sealed samples against which they buy, for possible future comparison. In Odessa the Russian buyer deposits his sealed samples with the local bourse. Here records are made, and should the goods arriving be inferior to the samples bought against, the matter is referred to an arbitration board. A form of contract considered very useful by certain reliable Odessa firms and which can be adapted to many articles of trade, is transmitted herewith [and will be loaned by the Bureau of Manufactures].

[From Consul General John H. Snodgrass, Moscow.]

**Cold Storage.**

At its yearly meeting the refrigerator committee of the Moscow Agricultural Society discussed the question of opening a refrigerator museum in this city in the near future, and also the subject of participation in the sheep-breeding exhibition to be held in Moscow this fall, by organizing a section illustrative of the refrigerating business. Improved methods of transporting meat, butter, and fish from Siberia were considered in connection with the project of the chief management of railways to regulate the shipment of such foodstuffs by the erection of modern refrigerators at certain points along the line of the railway.

---

*Bank dividends.*—The recent 17 per cent dividend, free of tax, of the British Bank of South America was noted in Daily Consular and Trade Reports for April 3. It is now stated that the London and Brazilian Bank is also paying 17 per cent, with a special bonus of 5 per cent in commemoration of the jubilee of the bank.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8791. Show-case counters.**—The Bureau of Manufactures is in receipt of a communication from a manufacturing concern in the United States advising that one of its correspondents in Porto Rico has requested to be placed in touch with some dealer in the United States handling show-case counters. Correspondence, in Spanish, should be direct with the inquirer.
- No. 8792. Machinery for soap and candle making.**—An American consul in a Latin American country reports that a concession has been granted to a resident of his district to establish a soap and candle factory, and catalogues are requested showing machinery and prices of same. A small plant is desired. Manufacturers should send catalogues, price lists, correspondence, etc., in Spanish, to this firm.
- No. 8793. Well-drilling machinery.**—A foreign business man informs an American consulate that he desires to be put in communication with manufacturers of machinery for drilling artesian wells, and would like to receive catalogues describing such machinery. Owing to the unusual scarcity of water in the section of the country in question, it is believed that a good market for this class of machinery can be developed. Names of other importers who might be interested in well-drilling machinery are given in the report also.
- No. 8794. Iron and steel products, machinery, and tools.**—One of the commercial agents of the Department of Commerce and Labor reports that a resident of a country in the Near East, who has the capital and facilities for doing a large business, desires to represent American manufacturers of iron and steel products of all kinds, machinery, and machine tools. He would also like to get in touch with manufacturers of steel rails, locomotives, and cars for railroads, with a view to securing Government contracts for these supplies.
- No. 8795. Screw drivers.**—A business man in a European country informs an American consular officer that he is desirous of obtaining the names of American manufacturers of screw drivers. He desires a tool which has a handle like a knife and which can be pushed in after releasing the catch.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

- No. 634. Coal.**—Sealed proposals for furnishing and delivering 3,600 tons, more or less, of bituminous coal will be received at the United States Engineer Office, 920 Seventeenth Street NW., Washington, D. C., until May 31, 1912. Information on application to W. C. Langfitt, Lieutenant Colonel, Engineers.
- No. 635. Steel traveling cranes.**—Sealed proposals for furnishing and erecting two steel traveling cranes will be received at the United States Engineer Office, Seattle, Wash., until May 31, 1912. Information on application to that office or to United States Engineer Office, Pittsburgh, Pa.
- No. 636. Panama Canal supplies.**—Sealed proposals, in triplicate, will be received at the office of the General Purchasing Officer of the Isthmian Canal Commission, Washington, D. C., until May 20, 1912, for furnishing structural steel, rivets, galvanized conduit, electric cable, wire, fuses, sockets, plugs, dry cells, carbons, vulcanized red fiber, wire solder, and wire clamps. (Circular No. 707.)
- No. 637. Condemned ordnance stores.**—Sealed proposals, in duplicate, subject to the usual conditions, will be received at the Rock Island Arsenal, Rock Island, Ill., until May 24, 1912, for the purchase of condemned ordnance stores. Catalogues giving quantities, conditions, etc., can be had on application to the commanding officer, Rock Island Arsenal.
- No. 638. Sulphate of alumina.**—Sealed proposals for furnishing and delivering about 400 tons of sulphate of alumina will be received at the United States Engineer Office, 920 Seventeenth Street NW., Washington, D. C., until May 31, 1912. Information on application to W. C. Langfitt, Lieutenant Colonel, Engineers.

## ESSENTIAL OIL INDUSTRY OF THE RIVIERA.

[From Consul William Dulany Hunter, Nice, France, Mar. 14.]

The changes in the perfumery industry on the Riviera during the past few years, due to the formation of associations or syndicates, both of the flower growers and of the perfume manufacturers, have not modified to any great extent the conditions existing previous to their organization. A company with a capital of 14,000,000 francs (\$2,702,000) is being formed by the two principal manufacturers of this region, and it is supposed that this combine will greatly influence the future development of the perfume industry, as these two firms control about one-fourth of the total export of this commodity to the United States.

The associations formed among the growers to control the prices of the flowers have not had the success that was expected by their promoters. These syndicates can be divided into two categories, the first of which is an association formed for the possible monopoly of the sale of a certain flower grown by members of the syndicate. The second is an association of the flower growers of certain villages or districts with the aim of improving the general condition of the industry and of realizing the highest prices for their products, but without the intention of dictating the prices of the flowers.

### Orange Flower Syndicate.

The largest association in the first-mentioned category is the Syndicat des Fleurs d'Orangers, founded several years ago and controlling about 65 per cent of the total orange-flower production. Its members are bound not to sell their output direct to the perfume manufacturers, but to deliver to a committee, elected by the members, which is authorized to sell the flowers at a minimum price agreed upon at a general meeting. In case the manufacturers are not willing to pay the price demanded, the committee distills and manufactures the essential oils and flower waters and sells them direct to the trade in competition with the perfume manufacturers.

In 1909, before the manufacturers had formed their association, they were obliged to accept the prices dictated by the orange-flower syndicate, but since then conditions have changed, for the following reasons: The chief product of the orange blossom is the essential oil called neroli. The average catalogue price of neroli for the past three years has been about 600 francs a kilo (\$52.52 per pound), and at this figure the manufacturers had a large margin for their profit as well as for the commission and other rebates offered by them to the trade. At the price dictated by the flower syndicate the margin of gain was too small, and the perfumers found a way of replacing neroli with mixtures of synthetic essential oils, which could be sold at lower prices. The orange-flower growers were, therefore, obliged to distill their own flowers.

The syndicates can not compete successfully with the perfume manufacturers, as the former handle the products of only one flower, while the latter can utilize the services of their employees and their machinery during the whole year for the manufacture of essences from various kinds of flowers. The flower syndicates have at present on hand a stock of neroli estimated at over 4,000 kilos (8,818 pounds) which they are offering to the manufacturers at a cash price of 400 francs per kilo (\$35.02 per pound) without finding buyers.

#### **Nonmembers' Contracts—Jasmine and Perfumers' Syndicates.**

In consequence the orange-flower growers who are members of the combine have not been able to realize the value of their productions and are worse off than those who have the right of free sale for their output. The growers who are not members of associations have signed contracts with the manufacturers for a number of years, the latter having agreed to buy their total crop at a stipulated price. This has the advantage of permitting the manufacturers to sell their products at fixed prices and to sign contracts with consumers for long periods, thus giving stability to prices and making it possible to so regulate the output as not to increase the stock on hand beyond the probable demand.

More successful than the orange-flower combine has been the syndicate of the jasmine growers, which has been able to find several large customers at Paris who are willing to buy at remunerative prices the association's entire present output of concrete of jasmine. The syndicate controls about one-tenth of the production of the jasmine flower and has not been able to obtain many new members, as the experience of the orange-flower association has increased the number of growers who prefer the direct-contract system. There is a union of rose and violet growers, but it controls too small an amount of the total crop of these flowers to be able to influence, to any extent, the existing market prices.

The manufacturers of perfumery have also formed an association called *Syndicat des Parfumeurs*. This was founded to counterbalance the syndicate of the flower growers, to form a union among the manufacturers for their mutual protection, and to eliminate competition between the different firms; but owing to the absence of unanimity among the manufacturers, due to old and personal rivalries between the different firms, it was impossible to realize the hopes entertained at its foundation. The *Syndicat des Parfumeurs* has for these reasons remained a purely debating society, and the resolutions voted are not even binding upon the members.

**Geranium d'Afrique and Bois de Rose Femelle.**

An important change has taken place in the prices of the essential oils Geranium d'Afrique (oil of rose geranium) and of Bois de Rose Femelle (linaloe oil). The large increase in the price of Geranium d'Afrique is due neither to the syndicate of flower growers nor to the manufacturers, but to other causes, the principal one of which is that about two years ago this essential oil was quoted at 22 francs per kilo (\$1.93 per pound) and even lower. At these prices it was not remunerative to grow the geranium for the manufacture of perfumery, and many of the large producers preferred to use the soil for more profitable culture. There being no unanimity among either cultivators or manufacturers to curtail production or to fix a minimum price, those manufacturers who tried to maintain prices lost heavily.

Another reason for the advanced price of Geranium d'Afrique was the small crop from Africa, and especially from Ile Bourbon (Reunion), and of large contracts for delivery of the oil during this and the beginning of next year. Buyers not having the necessary quantity of geranium on hand are obliged to cover their needs at figures far above those stipulated in their contracts. At present it is difficult to procure geranium at 40 francs per kilo (\$3.50 per pound); 45 to 50 francs per kilo (\$3.94 to \$4.38 per pound) are being asked, but there are no purchasers at these advanced rates.

The decline in price of essential oil of Bois de Rose Femelle (linaloe oil), which has fallen from about 35 francs to 22 francs per kilo (from \$3.06 to \$1.92 per pound), is caused principally by overproduction, but it is not likely that these low quotations will be long maintained.

**Oil of Violets.**

The crop of violets has been especially good this year, and they are offered by nonassociated growers at 3.5 and 4 francs per kilo (31 and 35 cents per pound). These are the lowest prices in years; still it is not likely that there will be any decided fall in the price of essential oil of violets, as the manufacturers are bound by contracts to the flower growers and are paying 5 francs, 5.5 francs, and even higher per kilo (44 and 48 cents per pound), and have agreed to sell to their customers on certain dates the essential oil to be produced this year. The value of the concrete of violets, about 1,800 francs a kilo (\$157.58 per pound), makes it impossible for any but very substantial firms to keep a large stock of essential oil of violets on hand, and the loss of interest would counterbalance in large part the present low price of violets.

[A review of the Sicilian essential-oil industry appeared in Daily Consular and Trade Reports on Apr. 9, 1912.]

**AMERICAN STATISTICS FOR PERFUMERY AND COSMETICS.**

In giving the general statistics for the establishments reported for the census of 1909 as engaged primarily in the manufacture of perfumery and cosmetics in the United States the Bureau of the Census states that of the total number (429) 195 are conducted by individual proprietors, 65 by firms, and 169 by corporations. Other data follow: Proprietors and firm members, 358; salaried employees, 1,484; wage earners (average number), 2,375; capital, \$6,788,364; salaries, \$1,647,657; wages, \$994,221; materials, \$5,634,031; miscellaneous expenses, \$3,365,701; value of products, \$14,211,969;

value added by manufacture (value of products less cost of materials), \$8,577,938.

American official records show imports into the United States of "perfumeries, cosmetics, and all other toilet preparations" valued at \$1,250,855, \$1,120,396, \$1,425,613, \$1,214,792, and \$1,534,537, respectively, for the last five fiscal years. By principal countries the imports during 1909, 1910, and 1911 were:

Countries.	1909	1910	1911
Austria-Hungary.....	\$2,836	\$5,283	\$5,790
Belgium.....	1,313	856	2,164
France.....	1,265,975	1,044,306	1,353,036
Germany.....	60,547	73,553	58,450
Italy.....	9,151	7,920	9,090
Russia in Europe.....	730	3,856	2,101
United Kingdom.....	66,133	56,693	82,243
Cuba.....	1,576	2,039	833
Japan.....	14,065	15,967	18,536
All other countries.....	2,968	4,418	4,268
Total.....	1,425,613	1,214,792	1,534,537

The United States exported "perfumeries, cosmetics, and all other toilet preparations" to the value of \$604,822 in the fiscal year 1907, \$620,230 in 1908, \$683,253 in 1909, \$824,460 in 1910, and \$1,009,359 in 1911. Canada was the chief purchaser throughout this quinquennial period, taking \$203,648 worth in 1911. The Philippine Islands ranked second last year with \$40,896 worth, Panama third with \$37,410 worth, the other principal buyers being: Honduras, \$11,510; Nicaragua, \$11,398; Mexico, \$22,496; Jamaica, \$15,483; Cuba, \$31,624; Australia and Tasmania, \$31,774; Canary Islands, \$12,251; and Egypt, \$11,202.

#### NEW PERFUMES FOR SOAPS.

The manufacture of soaps demands perfumes of a very special tenacity and of absolute stability against alkaline agents. For this reason a considerable market has been opened for several substances belonging to the series of ether oxides, single or mixed.

One of the most interesting, says *La Parfumerie Moderne*, is unquestionably the artificial oil of geranium, which we may state at once has no connection as regards constitution with the real oil of geranium; its odor, especially in soap, however, recalls this with sufficient fidelity for it to have come into serious competition with the oils of Bourbon and of Africa. It is oxide of phenyl. The most desirable method of its manufacture is without question the industrial application of the general method of Gladstone and Tribe. The phenol is heated to a temperature near its boiling point and with the usual precautions aluminum is added in the quantity given in the equation:  $3C_6H_5OH + Al = 3H + Al(C_6H_5O)_3$ . Then the phenolate of aluminum thus obtained gives by dry distillation the oxide of phenyl according to the equation:  $2Al(C_6H_5O)_3 = Al_2O_3 + 3C_6H_5 - O - C_6H_5$ .

Other methods may be employed, such as heating the phenol with the sulphate of diazobenzene, or, again, heating the phenol to about 350° in the presence of chloride of aluminum, etc.

Oxide of phenyl melts at 28° C. and boils at 253° C. Melted it has a fluorescent appearance and, thanks to its ether oxide function, it is very stable. There can be obtained as product usable in soap making one-third the weight of the phenol utilized. This field, in connection with the low cost of materials used, makes a product of great aid in cheap soap making. It is mixed with oils of citronella, palmarosa, clove, and vetiver, even with other chemical perfumes, such as formiate of citronellyl and terpineol, so as to obtain a large series of odors all based on geranium. It is usually estimated that 100 grams of oxide of phenyl have, as regards intensity, a value equivalent to a kilo of the Bourbon oil without having, it must be admitted, the same delicacy, but altogether sufficient for the production of ordinary goods, or for disguising certain odors of rancidity originating in the fatty substances used.

**DEVELOPMENT OF ARTIFICIAL-SILK INDUSTRY.**

[From Consul William H. Hunt, St. Etienne, France.]

Notwithstanding the rapid increase in the number of French mills, the production of artificial silk remains far below that of real silk and wholly inadequate to the demand. In 1909 over 32,000,000 kilos (70,547,900 pounds) of real silk were turned out by the world's producing centers, but the spinning factories for artificial silk were unable to deliver more than 1,350,000 kilos (2,976,200 pounds).

The raw material used in the production of the latter is cotton. Its chemical nature does not change after manufacture, and, except for some additional process to render it brilliant or incombustible, it is still nothing but cotton. Therefore, the only difference between artificial silk and cotton fabrics lies in the weaving process—mechanical for cotton stuffs, chemical for artificial-silk stuffs.

Three processes are in general use, the Chardonnet, the viscose, and the one called vegetable casein (*caséine végétale*). Competition is based on cost. From that point of view the viscose process seems to be the most desirable, costing only \$1.35 to \$1.55 per 2.2046 pounds, but that is still considered rather dear.

**Spun Glass.**

Recently patents have been taken out for an artificial silk, the base of which differs from those now in use. It has the advantages that it is unflammable, unaffected by humidity, and indestructible by acids or by alcohol.

The new silk is at base spun glass—spun at one-eighteenth of a hair's diameter. This almost imperceptible filament, to which the addition of different chemical products gives brilliancy and suppleness, is stronger and more solid than any of the other artificial silks of commerce. It can be twisted, braided, or woven with extraordinary facility, and constitutes a real advance in that industry the product of which the Germans call "glanstoff" and the French "artificial silk."

This new product, said to be superior in all points to the others, has also the advantage that it costs only 25 to 30 cents per 2.2046 pounds to produce.

[Among numerous other articles on artificial silk that have appeared from time to time in Daily Consular and Trade Reports were those published on July 30, 1910, and Mar. 1 and 25 and July 17, 1911.]

**JAVA'S TEA EXPORTS.**

[From Consul B. S. Ralrden, Batavia.]

The Tea Export Bureau of Batavia publishes figures on the exportation of Java tea for 1911, showing that such shipments amounted in that year to 50,518,475 pounds, in contrast to exports aggregating, according to official statistics, 33,742,646 pounds in 1910.

The business in tea for the past year showed that the United States took some 214,141 pounds; Holland, 22,649,445 pounds; Great Britain, 15,501,522 pounds; Australia, 5,578,608 pounds; Straits Settlements, 3,237,573 pounds; Russia, 2,005,290 pounds; Canada (Vancouver), 189,660 pounds; and other countries not specified, 1,142,236 pounds. Tea exporters predict that business with the United States during 1912 will probably exceed that for last year.

**CRIN VEGETAL OF ALGERIA.**

[From Consular Agent Albert H. Elford, Oran.]

Vegetable fiber, or crin vegetal, is made from leaves of a dwarf palm (*Chamaerops humilis*) which clings to the soil tenaciously. Its presence was a serious obstacle to the pioneers of Algerian colonization, and it had to be fought foot by foot. It was not then known that the plant would become a source of wealth to the colony and that it would be more and more sought as a commercial product.

This palm grows abundantly throughout Algeria—in sandy coast soil, among rocky mountains, as well as in rich, deep soil. Heat, cold, rain, and drought do not harm it. While the progress of colonization has greatly diminished the area covered, the plant remains practically inexhaustible on certain mountain slopes and sand dunes.

After several attempts had been made to utilize the palm, satisfactory results were obtained in 1847. The leaves were separated by a comb into long and flexible filaments, which were twisted into rope shape. With a few modifications this method is still successfully employed. The low price of the article enabled it to compete easily and in many lines with animal hair.

**Gathering and Marketing.**

The palm leaves are plucked by the Arabs only when they have nothing else to do, the work being poorly paid. In years of drought it is their only resource. Treated on the spot simply and economically and slightly dried, the leaves are sold by local manufacturers to export firms on the seacoast, where, after a few days' exposure to the sun, they are made into bales of 90 to 120 kilos (kilo = 2.2 pounds) each.

Crin vegetal serves well for stuffing furniture and mattresses, important steamship lines having bought it for several years in large quantities for emigrants' mattresses. The 12 to 15 kilos needed for a comfortable mattress cost in Belgium or Germany only about 1 franc (19.3 cents). This does not include the cost of the cover, as in accordance with emigration laws only the stuffing must be removed.

This vegetable fiber, particularly the elastic quality produced in the Department of Oran, can be used for cleaning and polishing floors, wood, and brass work. Its use for domestic and other purposes is causing increased sale, replacing many other more expensive articles. Being a repellant of vermin it is of great service for barracks, colleges, hospitals, and lodgings.

The Arabs are paid 2 francs per quintal (220.46 pounds) by the local manufacturers, who sell it to the shippers at 4.5 to 5 francs, and by them resold at about 7.5 francs per quintal. There is naturally much loss in weight while in transit from its virgin form to the shipper. Sales are f. o. b., consequently freight charges must be added; these are not high, considering the volume. Freight rates per ton are 12 to 16 francs to Antwerp or Hamburg, 10 to 15 francs to Italian and Adriatic ports, \$3 to \$4 to the United States, and \$7 to \$8 to South America. Into most countries the article enters free of duty.

**Exports—Price Regulation.**

Up to 1875, the production of crin vegetal was absorbed locally almost entirely. Exportation then commenced. In 1908 shipments

aggregated 25,527,500 kilos; in 1909, 27,958,000 kilos; and in 1910, 34,064,100 kilos.

The most important customers are the United States, Italy, Germany, Austria, Belgium, and France. At one time, owing to active competition, shippers were sometimes compelled to sell almost at a loss. Business naturally suffered from this state of affairs, and buyers in the United States took advantage of this fall in prices to buy extensively, which explains the increase in shipments during 1910, but shippers are now syndicated, and more remunerative prices have been fixed upon.

### PAPER-YARN FABRICS.

[From Consul Augustus E. Ingram, Bradford, England, supplementing articles in Daily Consular and Trade Reports of June 6, 1911, and Jan. 8, 1912.]

I have been making further inquiries and, so far as I can learn, it is too early to say that paper-yarn textiles have passed the experimental stage in England. The Silvalin Yarn Spinning Co., of Manchester, hopes soon, so I am indirectly informed, to commence operations in this country. A textile expert connected with that company has been actively at work bringing this new material to the attention of textile manufacturers throughout the country, and trials are being made at various places by technical colleges and practical business men. Two firms in this district are experimenting, and one of them informs me that it has been experimenting for more than 12 months. This firm has been kind enough to give me small samples of the textiles it has made. [These, marked "A" to "E," inclusive, will be loaned by the Bureau of Manufactures.]

The fabrics marked "A" and "B" are all paper, except where in "B" the white mottled effect is due to a cotton thread wound around the paper yarn. Fabric "C" is a cheap rough trousering suitable possibly for a warm climate. Fabric "D" is a poplin effect. Fabric "E," probably the most successful of any of these experimental weaves, is a twill venetian coating, the warp showing on the face being a crossbred wool while the weft thrown on the back is of paper. The weight of this last fabric is about 20 ounces.

In regard to this last fabric, the maker said it was woven 60 inches wide; in weaving there was no shrinkage in the width but considerable loss in length, as the warp had to accommodate itself to the stiffness of the weft. My informant stated that he was as yet somewhat dubious as to success in fabrics other than heavy cloths suitable for curtains and upholstery purposes. He was satisfied as to the cheapness of the yarn and also as to its strength ordinarily. At times, perhaps owing to imperfections in spinning, the yarn proved brittle. All the yarn being experimented with, so I am informed, is obtained from Germany.

### Foreign Trade of Italy.

Consul General James A. Smith, of Genoa, writes that Italy's exports for the first three months of the present calendar year reached \$108,516,598, an increase of \$10,944,588 over the corresponding period of 1911. Imports amounted to \$161,313,187, a decrease of \$7,485,666.

**HEMP FIBER FOR PAPER MAKING.**

[From Consul General George E. Anderson, Hongkong.]

Twelve large paper-manufacturing concerns in the eastern portion of the United States, having an organization center in Boston, have joined in the formation of a Philippine corporation [name obtainable from the Bureau of Manufactures] which will purchase and handle for these manufacturers hemp and hemp by-products now to be had in the Philippines. The capital of the company in the Philippines is placed at \$150,000 gold, but it is stated by the incorporators that a large amount of capital is back of the venture.

The stock in the new concern is all held by paper manufacturers, and they expect to use the company's entire output in their own establishments in the United States. American machinery has already been imported to some extent and more has been ordered. Eventually a pulping factory will be established in Manila to utilize such supplies of hemp as may be purchased in the field or in an unmanufactured state, but for the present the company expects to devote its energies to the purchase of hemp which has been prepared on special machines designed to use the whole hemp plant.

**Special Qualities and Uses of Hemp-Fiber Paper.**

The new enterprise rests upon the demand in the United States for fiber for the manufacture of certain classes of paper of an especially strong and tough grade. Experts report that a 1-inch strip of hemp-fiber paper will sustain a weight of 100 pounds.

For the past six years or so there has been a strong and increasing demand for waste hemp, the by-product of hemp stripping in the Philippines, for use in the manufacture of this paper in connection with junk hemp from old rope and the like purchased elsewhere. It has become more and more apparent to paper manufacturers, however, that the supply of waste rope and similar hemp refuse was not sufficient for their needs, particularly if the business of making paper bags as substitutes for cloth bags for flour and cement was to be extended; and an organization was formed to conduct experiments with a view of securing a new supply of raw material. The organization back of the new enterprise reports that it has expended about \$500,000 in experiments, but that so far no substitute for manila hemp has been found.

The concern's experts report that one peculiarity of manila hemp is that it is practically all fiber in construction, and that no matter how finely the hemp is divided it is still capable of division as fiber, while a fiber of cotton, for example, is only a tiny tube, a fiber of sisal is mere nonfibrous wood, and similar objections are had to other products.

**Whole Plant Used—Bag Factory.**

The result has been the conclusion that, all things considered, the use of the whole of the original hemp stalk will be the most economical way out of the situation. By present methods about one-third of the ordinary plant is lost in stripping and about one-third of the remainder is not used for the reason that the fibers are too small and too weak to be of commercial use. The new plan is to take the entire hemp plant as cut on the plantation and merely crush, dry, and clean it in especially designed machines.

Even at a lower price per pound for the whole plant than he receives per pound for about half of the original plant at the present time, after expensive handling, the planter will actually receive greater returns from his product than by the present methods. The enterprise is intended to afford a new and additional supply of raw materials of the sort needed in the manufacture of special varieties of paper—a supply capable of almost indefinite extension.

There has also been incorporated in Manila by interests allied to the concern above named a company which is to manufacture paper and cotton and other textile bags of all descriptions. The firm is to enlarge the business of a factory already operating under the control of these interests in San Miguel district, Manila.

[American official records show the following imports of unmanufactured manila fiber from the Philippine Islands during the last five fiscal years: 1907—54,067 tons, value \$10,776,622; 1908—52,233 tons, value \$8,922,890; 1909—61,622 tons, value \$7,127,187; 1910—92,507 tons, value \$10,435,743; 1911—74,219 tons, value \$8,614,603.—B. of M.]

---

### **AUTOMOBILE EXHIBITION IN AUSTRALIA.**

[From Consul Wm. C. Magelssen, Melbourne.]

F. Leslie Bruford, secretary of the Automobile Club of Victoria, Ludstone Chambers, 352 Collins Street, Melbourne, notifies this consulate that the committee of management, consisting of representatives of the club and dealers in automobiles, will hold an exhibition of motor cars in the Exhibition Building, Melbourne, and that applications are now being received for show space. The notification is given in order that American manufacturers and agents may avail themselves of this opportunity to bring their products before the buyers in this promising market. American cars are very popular here and it is to be hoped that our exhibits will be as elaborate and extensive as the field merits.

---

### **NATIONAL HORTICULTURAL EXHIBITION.**

[From Consul General John L. Griffiths, London.]

The National Horticultural Exhibition, May 22 to 30, 1912, on the grounds at Chelsea Hospital, London, England, it is stated, will be the largest of its kind ever held. It will include every conceivable variety of horticultural product, one division being allotted to fruit, another to vegetables, another to roses, etc. It is understood that all the exhibits will not be competitive, that some of the largest and most important are being sent for the delectation of visitors. Invitations have been issued to some 350 specialists in every branch of horticulture to officiate at this exhibition.

---

### **Spanish Olive Growers' Association Planned.**

Consul Charles S. Winans, of Seville, advises that at an assembly of olive growers called for May 1 it was anticipated a national olive growers' association would be formed, federating the 15,000 or 20,000 olive growers in Spain for mutual protection.

## DEPRESSION IN HONGKONG SUGAR TRADE.

[From Consul General George E. Anderson, Mar. 2; see also Daily Consular and Trade Reports for Aug. 1, 1911.]

While it is perhaps too much to say that the great sugar-refining industry in Hongkong, which has long dominated the refined-sugar market of the Far East, is threatened by a combination of circumstances, the record of the business for the past year is strong confirmation of the pessimistic views held in that connection.

The year 1911 was one of particularly small trade and 1912 opens with no better prospects. The chief element in the unfavorable situation is the dominance of the North China market by Formosan sugars as a result of the development of the industry in that island. This competition on the one hand has been met by failing supplies on the other. The satisfactory crop in the Philippines last year was exported almost entirely to the United States, imports from the islands into Hongkong amounting to only 9,324 tons, in contrast to 58,978 tons in 1907.

With the contraction in the world's supplies during the latter portion of the year and the resulting high prices the market for sugar in North and Central China was further restricted; for the Chinese consumer can not pay high prices for sugar, and any material rise in quotations is followed by lessened consumption. The revolution in China, trade depression generally, and other elements combined to reduce the volume of business done by the Hongkong institutions. Nevertheless the chief cause for decreased trade lies in the permanent development of other sugar centers.

## The Trend in New Directions.

The output everywhere in this part of the world is increasing, but it is not being handled and controlled in Hongkong. The manner in which Hongkong's former trade has been cut into in recent years is indicated by the following table of imports of raw sugar to be refined in Hongkong, about four-fifths being exported to China and the various markets in which Hongkong is interested:

Imported from—	1909	1910	1911
	Tons.	Tons.	Tons.
United States.....	2		1
Burma.....			59
China.....	12, 108	14, 719	8, 950
Cochin China.....	5, 012	3, 608	2, 173
Germany.....	III		38
Java.....	278, 030	221, 101	184, 874
Japan.....			59
London.....	16	15	6
Mauritius.....	400	556	890
Hongkong New Territory.....	62	164	3, 029
Philippine Islands.....	41, 930	10, 372	9, 324
Straits Settlements.....	2, 108	1, 284	71
Total.....	339, 684	261, 849	209, 743

The year 1911 was unusual in many respects, and the great falling off in business compared with 1910, and particularly with 1909, should not be taken as demonstrating too much. That the industry in Hongkong, in spite of modern equipment, cheap labor, cheap freights, and cheap transshipment facilities, is seriously threatened, however, is quite evident.

**Formosan and Philippine Situation—Sales to United States.**

During the past year the situation in Japan and Formosa has been characterized by increasing concentration and combination of sugar interests under Government supervision and control and, to some extent at least, with Government help.

In the Philippines the advancing output of sugar is to be further augmented not only by new plantations and increased acreage generally but also by improved methods of production. New centrals are being established in the Visayas, Negros, Cebu, and other districts. While the exports of sugar from the Philippines to the Hongkong refineries have declined in the past few years—58,978 tons in 1907, 50,492 tons in 1908, 41,930 tons in 1909, 10,372 tons in 1910, 9,324 tons in 1911—the exports of sugar from the islands in general have risen from 120,289 metric tons in the fiscal year 1907 to 149,376 metric tons in 1911. This is a peculiar course of trade, in view of the fact that raw sugar shipped from the Philippines is refined in Hongkong and reenters those islands after the payment of a duty of almost 2 cents gold per pound.

One feature of the past year's business in Hongkong has been the increasing number of small shipments of sugar to the Pacific coast of the United States—shipments which have indicated the possibility of large business under certain conditions if no trade agreements or mutual restrictions interfere.

---

**THE JAPANESE BUDGET.**

[From Ambassador Charles Page Bryan, Tokyo.]

In the Japanese budget for the fiscal year commencing April 1, 1912, the total revenue and expenditure balance at \$286,445,933, as follows: Ordinary revenue, \$251,277,903; extraordinary, \$35,168,030; ordinary expenditure, \$205,982,932; extraordinary, \$80,463,001. The sum of \$5,451,458 is appropriated for "extending steamship lines," a decrease from last year of \$19,183. A new subsidy of \$37,500 is granted to a South Sea Islands line. The aid to the North American routes amounts to \$2,223,642 (\$11,444 less than last year) and that to the South American to \$364,958. Besides this there are appropriations of \$361,768 for "encouraging navigation" and \$390,925 for the advancement of shipbuilding.

The policy of the Government is said to be one of retrenchment. The salient items of reduction in the new budget are the postponement of the Tokyo-Shimonoseki Railway broad-gauge conversion, the deferment of the improvement of secondary harbors, the abandonment of the Grand Exhibition, and the rejection of the demands for naval and military increments. Moreover, with a view to fundamental and permanent economies a bureau has been created to determine ways in which the administrative expenses may be cut down. The savings thus effected are to be applied to the next budget in the reduction of the taxes.

The sum of \$25,000,000 is to be set aside for the redemption of the national debt, and \$26,298,270 will be borrowed, of which \$20,000,000 will be used for the imperial railways and the balance for Chosen (Korea) and Formosa.

## WOOLEN MANUFACTURE IN JAPAN.

[From Consul George N. West, Kobe; supplementing article in Daily Consular and Trade Reports for Dec. 27, 1911.]

Of the woollen mills of Japan, outside of Government factories for army supplies, three are in the Kobe consular district—Japan Woollen Co., Japan Flannel Co., and Muslin Weaving Co. The following statistics were obtained by a visit to the mills:

	Japan Wool- en Co.	Japan Flan- nel Co.	Muslin Weav- ing Co.
Mills.....number.....	2	1	1
Cards.....do.....	17	7	
Spindles:			
Wool.....do.....	7,035	3,500	
Worsted.....do.....	13,400		21,600
Combing machines.....do.....	10		
Looms.....do.....	480	107	750
Yarn sold.....(pounds.....		30,000	
(value.....		\$17,500	
Mousseline de laine.....(yards.....			11,970,000
(value.....			\$2,000,000
Serges.....yards.....	1,070,000		130,000
Woolen and worsted fabrics, including flannel.....(yards.....	1,430,000	776,849	
(value.....	\$347,500	\$190,761	
Bunting.....yards.....	500,000		120,000
Blankets.....(pieces.....	640,000	61,531	
(value.....	\$400,000	\$33,175	

The Jomo Muslin Co., which is in the Yokohama district, has also furnished the Kobe consulate with data, as follows: Spindles, 12,800; sets of looms, 480; yarn sold, 360,000 pounds; cloth manufactured, 7,200,000 yards of bleached mousseline de laine, valued at 17 cents (United States) per yard.

[From Consul General Thomas Sammons, Yokohama, Mar. 9.]

Supplementing Consul West's report, it may be stated that, of the mills in the Yokohama district, the Matsui Mosurin Kabushiki Kaisha has been closed for over six months, being bankrupt, and the following statistics relate to the other two companies operating in the district:

*Tokyo Mosurin.*—Cards, 8; combing machines, 8; worsted spindles, 35,280; looms, 988; yarn produced for sale—1909, 1,247,473 kin (kin=1.32 pounds); 1910, 1,669,517 kin; 1911, 2,082,626 kin; gray and bleached fabrics manufactured (over 20 varieties)—1909, 13,426,374 yards; 1910, 10,450,890 yards; 1911, 14,087,055 yards; average value per yard, 13.55 cents (United States).

*Toyo Mosurin.*—Worsted spindles, 12,600; looms, 400; gray and bleached fabrics manufactured, monthly average, 850,000 yards; average value per yard, 13.45 cents (United States).

## NEW FREIGHT SERVICE TO SOUTH AMERICA.

The Mississippi Valley, South America & Orient Steamship Co. will inaugurate a new freight service from New Orleans to ports of Brazil and Argentina the latter part of June. The *Inkum*, a modern, fully equipped steam freighter, will be the first boat over the new route and will carry a full cargo, bookings having already been made up to the vessel's capacity. A monthly schedule both ways is to be maintained. The company, which is an American organization, sees in its new service the means for a rapid development of the trade between the Mississippi Valley and Gulf States and the southern Republics.

**WINTER PORT TRADE IN ST. JOHN.**

[From Consul Henry S. Culver, St. John, New Brunswick, Canada.]

The winter port trade includes the vessels which in summer run to Quebec and Montreal, making St. John their terminal port from November 15 to May 1 of each year, on account of the freezing of the St. Lawrence River. Nearly all of the Canadian transatlantic passenger and freight traffic is carried on at this port during this period, a small portion only going to Halifax. This season, up to April 29, 105 steamers took away Canadian goods valued at \$15,586,117 and United States goods valued at \$10,946,950. For the 1910-11 season the 111 sailings took away \$15,322,437 of Canadian goods and \$8,346,605 of American goods.

---

**DIESEL ENGINE FOR LOCOMOTIVES.**

[From the Near East.]

As one of the results of the recent coal strike, several of the leading railway companies of Great Britain are considering the adoption of the Diesel engine for locomotives. It seems admirably suited for this purpose, and the cost of running would be considerably less than even that of oil-fired steam engines.

W. T. Batho stated in a paper read before the Cleveland Institution of Engineers that a Diesel engine of 1,000 horsepower and weighing 85 tons had been built in Germany. This type of locomotive should be very useful in those countries of the Near East in which fuel oil is cheap and plentiful as compared with coal. Whether the other points in which steam excels the crude-oil engine, such as flexibility in power and ease of handling, will outweigh the reduction in running cost is a problem that can be settled only by experience.

---

**GASOLINE-DRIVEN RAILROAD CARS.**

[From Consul Walter C. Hamm, Newcastle-on-Tyne, England.]

The North Eastern Railway Co. has introduced a novelty in the form of a petrol-driven car, to be used for inspection purposes by the executive and district officers. Hitherto the work has been done with a coach drawn by an engine. The new cars, of which two have been built, are to be stationed at Newcastle and York, respectively. Each vehicle is 23 feet 6 inches long and 8 feet 6 inches wide. There is a saloon 16 feet long, with driver's compartments at each end. Three speeds of 15, 22½, and 45 miles per hour are provided.

---

**New Markets Needed for Argentine Meat.**

The minister of public works of the Province of Buenos Aires has called attention to the fall in prices of Argentine meat in London. He states that since 1908 the average price obtained for Argentine meat has fallen from 43½ centavos (41.8 cents United States) per kilo (2.2046 pounds) to 36½ centavos (35 cents) last year, and that consignments of excellent meat have been sold as low as 15 centavos per kilo. The minister holds it absolutely necessary that new markets for Argentine meat should be opened up. He regards Italy as a promising market, and states that the Italian Government had negotiated for the purchase and delivery of 30,000 cattle during the current year, but that difficulties in connection with the transport had not permitted the contract being concluded.

**FOREIGN TRADE OPPORTUNITIES.**

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8796. Lumber and woodwork for building purposes.**—An American consular officer in the Levant reports that an important concern in his district dealing extensively and exclusively in lumber is desirous of importing American lumber and woodwork for building purposes. The concern in question is especially interested in pitch pine.
- No. 8797. Fertilizers.**—A report from an American consular officer in a European country contains the information that there is a great demand for fertilizers in his district, as well as throughout the country. American producers should send their offers at once in English to a business man whose name is given in the report. Prices should be quoted either f. o. b. New York or c. i. f. city of destination. The percentage of phosphate or fertilizing salt contained therein should be stated also.
- No. 8798. Fish meal.**—A business man in Germany informs an American consular officer that he desires to obtain the agency for an American fish meal, for feeding purposes as well as for fertilizing.
- No. 8799. Construction of breakwater.**—The American consul general at Ottawa, Canada, reports that the Department of Public Works has advertised for tenders, to be received until May 23, 1912, for the construction of a breakwater at Trout Cove, Digby County, Nova Scotia. Plans, specifications, and form of contract can be seen and forms of tender obtained at the Department of Public Works at Ottawa, and at the offices of the district engineers, Halifax, Nova Scotia, and St. John, New Brunswick; also from the postmasters at Yarmouth and Centreville (Trout Cove), Nova Scotia.
- No. 8800. Shoes, rubbers, woolen goods, and paper.**—One of the commercial agents of the Department of Commerce and Labor reports that a resident of a country in the Near East would like to represent American manufacturers of shoes, rubbers, woolen goods, and paper of all kinds. Firms that are especially interested in securing Government contracts are preferred, although the person in question has good facilities for selling goods in the open market.
- No. 8801. Paper for wrapping camera films.**—An American consular officer in Germany reports that a business man in his district desires the names of American manufacturers of black paper, samples of which can be obtained from the Bureau of Manufactures, such as is used for packing and wrapping camera films. He states that he is constantly in need of large quantities of this article.
- No. 8802. Creosoted Douglas fir sleepers.**—A Government official in a foreign country has informed an American consular officer that it is proposed to advertise shortly for tenders for the supply of 90,000 creosoted Douglas fir sleepers for trial on certain railways. American firms in a position to supply these sleepers should get in touch with this official at once.
- No. 8803. Agency for cinematograph companies.**—An American consul in a Mediterranean country reports that a merchant in his district desires to represent American cinematograph firms. It is stated that a good business is carried on in imported films, as the moving-picture shows are some of the chief amusements. Correspondence may be in English, and full particulars should be sent as soon as possible.
- No. 8804. Heating, cooking, and other gas appliances.**—A report from an American legation states that one of the engineers of an electrical company in the country in question would like to receive catalogues from American manufacturers of all kinds of heating, cooking, and other gas appliances.
- No. 8805. "Mississippi" buttons.**—A business firm in a European country informs an American consular officer that it desires to purchase "Mississippi" buttons, supposed to be made of a white substance similar to mother-of-pearl. Correspondence may be in English.
- No. 8806. Collodion acetate.**—An American consular officer in the United Kingdom reports that a firm in his district desires the names of manufacturers of collodion acetate.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

- No. 639. Navy Department supplies.**—The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., will receive bids until May 28 for fuel oil, schedule 4550. Tenders are invited until June 4, 1912, for the following supplies: Schedule 4560, coal baskets, Port Orford cedar, plow steel wire rope; schedule 4545, brass covers, nickel steel recoil cylinder, recoil cylinder, recoil springs, steel castings, spring rod nickel steel, rod spring steel; schedule 4555, white glue, bits and steel cutters for boring and molding machines, band and scroll saws; schedule 4549, baking powder; schedule 4542, knife switches; schedule 4547, redwood; schedule 4543, comparing watches, stop watches; schedule 4556, hull steel rivets, steel bolts and nuts, steel stove bolts with nuts, tinned soft steel rivets, black wrought-iron or steel washers, wrought-iron bar; schedule 4559, steel bolts and nuts, stud bolts and nuts, steel rivets; schedule 4546, electric jib crane; schedule 4548, chucks, convex cutters, shell reamers, slitting saws; schedule 4561, ingot copper; schedule 4557, medium steel angles, bar steel, medium steel bars, galvanized bar steel, nickel bar steel, round cold-rolled steel, steel plates, galvanized medium steel plates, galvanized sheet steel; schedule 4544, ingot tin; schedule 4551, fuel oil; schedule 4554, engine distillate; schedule 4558, cast-iron pipe fittings, galvanized or wrought pipe, malleable iron unions.
- No. 640. Condemned Navy material.**—There will be sold at the navy yard, Charleston, S. C., the following articles belonging to the Navy, condemned as unfit for use therein: Launches, furniture, hose, dishes, hawsers, clocks, engine, scrap metal, etc. The sale will be for cash to the highest bidder, by sealed proposals to be opened May 20, 1912. Schedules containing form of proposals and terms of sale can be obtained upon application to the General Storekeeper, Navy Yard, Charleston, S. C.
- No. 641. Piles and lumber.**—Sealed proposals for furnishing and delivering piles and lumber on the river bank or wharves in Southwest Pass, Mississippi River, will be received at the United States Engineer Office, Room 325, Customhouse, New Orleans, La.
- No. 642. Waste paper.**—Sealed proposals for the fiscal year commencing July 1, 1912, will be received until May 21, 1912, for purchase and removal of waste paper. The estimated quantity of waste paper for the year is 600,000 pounds. It is required that the paper be removed weekly from each of the several buildings. Blank forms for proposals may be obtained by application to the Secretary of the Interior, Washington, D. C.
- No. 643. Aerial paper insulated cable.**—Sealed proposals, in duplicate, will be received at the office of the Chief Signal Officer, War Department, Washington, D. C., until May 20, 1912, for aerial paper insulated cable, in accordance with specifications 197-B and 554. Specifications, etc., can be obtained from the commanding officer of the above department of the service.
- No. 644. Frame buildings.**—Sealed proposals will be received at the Indian Office, Washington, D. C., until June 5, 1912, for furnishing materials and labor for the erection of a frame school building and frame quarters at the Twin Lakes Day School, White Earth Indian Reservation, Minn., in strict accordance with the plans, specifications, and instructions to bidders, which may be examined at the Indian Office, the offices of the supervisor of construction, Denver, Colo.; the Improvement Bulletin, Minneapolis, Minn.; the Times, Crookston, Minn.; the Pioneer, Bemidji, Minn.; the United States Indian warehouses at Chicago, Ill., St. Louis, Mo., and Omaha, Nebr.; the Builders and Traders' Exchange at St. Paul, Minn.; and at the school. For further information apply to the superintendent of the White Earth Indian School, White Earth, Minn.
- No. 645. Life-saving station buildings.**—Sealed proposals will be received at the office of the United States Life-Saving Service, Treasury Department, Washington, D. C., until May 18, 1912, for the construction of a new life-saving station building, outbuildings, etc., at Rockaway Point, Long Island, N. Y. Specifications, etc., can be obtained of keeper of station, Rockaway Beach, N. Y.; superintendent of life-saving district, Bay Shore, N. Y.; superintendent of construction, 507 Hudson Street, New York, N. Y., or at Treasury Department.

**RAPID-TRANSIT VEHICLES FOR INDIA.**

[From Consul José de Olivares, Madras.]

Through an inadvertency, in my report published in *Daily Consular and Trade Reports* on February 13, 1912, the dimensions of the city of Madras were erroneously stated. The correct measurements of the city, as supplied to this consulate by the corporation engineer, are as follows: Average length,  $8\frac{1}{2}$  miles; average breadth,  $3\frac{1}{4}$  miles; actual area, 27 square miles.

The ample distances characteristic of Madras are further contributed to by successions of villages, which, although actually outside the corporation limits, are practically extensions of the metropolis and connected with it by continuous, well-kept roadways.

So great are the distances daily traversed by the people living in and about Madras and so insufficient the local public transportation facilities that the requirement of private facilities for getting about with due celerity has developed into an urgent and ever-increasing need. It is this condition that has brought about the large and growing demand hereabouts for bicycles, motor cycles, and automobiles.

**Maintaining American Prestige.**

The advent of motor vehicles in Madras is of comparatively recent date, but within a very brief interval they have to a great extent supplanted carriages drawn by horses, which formerly constituted the chief means of transportation among the European contingent.

American-made motor vehicles have, in the face of much opposition and prejudice, succeeded in winning a foothold in this consular district, and it is earnestly hoped that the manufacturers and exporters of the United States will follow up the prestige thus gained by inaugurating an aggressive campaign looking to the eventual supremacy of the American motor vehicle in Madras.

Such a campaign in behalf of American vehicles adapted to the needs of this community may count upon the fullest cooperation of this consulate, and also, I firmly believe, upon a genuine interest and responsiveness on the part of dealers and purchasers throughout the district.

---

**MARKET BAGS IN BRITISH ISLES.**

[From the official Indian Trade Journal.]

It is understood that the United Kingdom imports bags, called "market bags," which are made of matting or "bass" and used in large numbers by fishmongers and greengrocers. Advices encourage the belief that a good trade in the superior qualities of bags of this description might be done in Germany, where it is the practice of ladies of all but the highest position to do their own marketing. It is stated that these bags are usually shipped from China in large bales containing 400 sets—each of three sizes—say 1,200 in all. The range of sizes is 18 by 12 inches, 16 by 10 inches, 14 by 10 inches, and 13 by 8 inches, the bottom having a concertina fold to admit of their expanding. The bags should be plaited as lightly as possible, the handle being made of the same material as the bag; but, failing this, a strong cord made of hemp or other kindred material will answer the purpose equally well. In order to ship the bags at the lowest freight rates, bags of the three sizes should be placed inside each other and the whole should be packed in hydraulic-pressed bales. The wholesale price of the ordinary quality of these bags is about 50s. (\$12.16) per bale, c. i. f. London, but it is stated by certain buyers that a better price might be paid for a superior quality.

## WORLD RAILWAY DEVELOPMENT.

### RAILWAY BUILDING IN FORMOSAN MOUNTAINS.

(From Consul Samuel C. Reat, Tamsui.)

The Railway Department of the Formosan Government is building a mountain railway that will elicit favorable criticism from the engineering fraternity in many countries. This construction involves steep gradients, sharp curves, a picturesque spiral, and many tunnels and bridges. The entire railway will cover 41 miles, from Kagi to Mount Ari station (Nimandaira)—the latter point being 7,000 feet above sea level.

From Kagi to Chikutoki, 9 miles, the grade is 1 in 50. From Chikutoki, Nimandaira is reached after a 32-mile zigzag climb up the mountains to 7,000 feet, the gradient being 1 in 20, or 5 per cent. Nearly the entire line (80 per cent) is sinuous, the sharpest curve being 35 degrees. To reach Nimandaira the railway must circle a peak spiral fashion. The spiral construction begins at 1,824 feet and ends at an elevation of 2,500 feet. Between Kagi and Mount Ari there are 70 bridges, 73 tunnels, and almost innumerable cuts.

The Rinnai or forest railway is 18 miles long, is tortuous, and has a gradient of 1 in 16. This railroad is called the Mount Arisan line, Mount Ari lending its name to the railway as well as to the giant forests that are the objective point of the undertaking.

### Overcoming the Difficulties—Importance of the Line.

The exploitation of the valuable forest of Mount Ari is no new enterprise. Years ago a private company surveyed a line and commenced constructing a road. But the undertaking was abandoned after futile attempts to interest private capital. Then the Government was approached to take over the property of the private concern

and carry forward the work. After considerable discussion in the Imperial Diet an appropriation of \$2,450,000 was made in 1910 for the Mount Ari forest exploitation. Practically the operation and property of the private company were of no value, and the work was started anew. The most capable engineers of the Government are directing the construction, and difficult obstacles are being rapidly overcome.

Aside from the extension of the frontier lines, no undertaking by the Formosan Government is more important to the island's development than the Mount Ari enterprise. Not only is it an important undertaking, but it is a picturesque one. The traveler reaches Mount Ari station now by sedan chair, with the clouds way below him; above him is scarcely any demarcation between earth and sky. When this altitude is gained, he looks upon a magnificent primeval forest, some trees of which are 2,000 years old, 135 feet high, 65 feet in circumference at the base, 25 feet at the capital, with no branch visible until a height of 45 feet. Such trees as the *Chamaecyparis obtusa* (Hinoki), red *Chamaecyparis* (Benihi), and oak, forming the three useful species, may be taken as the chief object of the sylvan industry.

#### Value of American Equipment Recognized.

American manufacturers should be interested in this Mount Ari forest exploitation, because American locomotives and American machinery are almost exclusively employed. At present two American-built locomotives (the Shay high-g geared type) are operating on the mountain section, the gauge being 2 feet 6 inches. Two new locomotives of the same type have been ordered from the Lima (Ohio) Locomotive & Machine Co. The rails for this railroad were also bought in the United States.

At Kagi, where this line begins, there will be erected an American sawmill—the Allis-Chalmers Co., of Milwaukee, having recently been awarded a contract involving \$150,000. The Ladderwood Manufacturing Co., of New York, is furnishing a log-handling apparatus at a cost of \$25,000. The entire railway will be finished probably by January, 1913, when logs will be delivered from the forests of Mount Ari to the American-built sawmill at Kagi. The Mount Ari undertaking was first reported by this consulate in Daily Consular and Trade Reports for January 24, 1910.

For blue prints and information this consulate is indebted to S. Nimoto, Chief of the Imperial Formosan Railway. Blue prints and photographs are being forwarded [and upon receipt will be loaned by the Bureau of Manufactures at Washington.]

---

#### WESTERN JAPAN LINES.

[From Consul Carl F. Delchman, Nagasaki.]

#### New Government Railways.

The Imperial Government Railways report increased earnings on all their lines in this district, opened several sections of branch lines during 1911, and are making surveys for extensions. The Oita branch line from Kokura, on the main line from Moji, to Oita on the north-east coast of Kiushu, was completed and the last section (40 miles)

between Yanagigawa and Oita opened to traffic on November 1, 1911. Construction of this section was commenced in April, 1908, and the total expenditure was \$2,115,504, or about \$53,136 per mile. There are 7 tunnels, with an aggregate of 5,189 feet. 100 bridges aggregating 5,810 feet, and 11 stations. As the various sections have been completed they have been opened to traffic that to Beppu Hot Springs having been opened in July, 1911.

#### **Building of Private Lines.**

The privately owned light steam railways in different parts of Kiushu Island now in operation report good earnings, and they are rapidly developing the sections through which they run. The Shimabara Railway in Nagasaki Prefecture and the Dai Nippon and the Kikuchi Railways in Kumamoto Prefecture are extending their lines, while one new line is under construction and charters have been granted to six new companies to build light steam railways in Kumamoto, which embraces the principal agricultural district of the island. In Oita Prefecture four companies have received charters to build light railways and in Kagoshima Prefecture one charter has been granted. Work has not yet begun on these lines, however.

---

#### **CHINESE RAILWAY ENTERPRISE.**

[From Consul Julian H. Arnold, Amoy.]

The Fukien Railway Co., a local Chinese company engaged in building a road from Amoy to Chang Chow, 30 miles distant, has completed about 18 miles of its road and exhausted its funds (\$1,000,000). To complete the line will require \$300,000 for a bridge and \$150,000 for the remainder of the road. The 18 miles now completed are being operated at a loss of \$1,500 a month; 10,000 passengers a month are carried, but the hauls are too short to net the company a profit. Last year a promise of \$150,000 was secured from the Chinese in Java, to go toward completing the road to Chang Chow city, 30 miles from Amoy, after which it is estimated the road will be on a paying basis. The company is to be reorganized and, according to reliable reports, Dr. Lim Boon King has been appointed to effect reorganization and will be empowered to raise the necessary capital to complete the construction of the road.

---

#### **TRAMWAY LINE IN CANARY ISLANDS.**

[From Consul W. W. Kitchen, Tenerife.]

The Electric Tram Co., composed of Belgian capitalists and employing modern methods and equipment, materially improved its system all along the line last year. The 15-mile extension from Tacaronte to Orotava has not been consummated and the prospect looks forlorn, for the reason that, besides being an expensive road to build because of the unusual gradients, the company would, as heretofore, have to give the Government the usual 25 per cent of the gross receipts. As this leaves a very small margin of profit at present, it would leave still less, if any, on the road projected.

The completed portion of the road consists of two sections of approximately 7 miles each, from Tenerife to Laguna, and again from the latter place to Tacaronte. Laguna has 15,000 and Tacaronte

nearly 3,000 inhabitants; both have altitudes of over 1,800 feet. The power works are situated at Cuesta, a village with an altitude of about 600 feet, nearly midway between Tenerife and Laguna. This work is elaborate and up to date. Two engines (direct-action) drive the dynamos (Dulait system), which work up to 200 kilowatts. Galloway boilers, Green economizers, and Tudor accumulators are included in the equipment. The condensing water is cooled by a tubular refrigerator (Koerting system). On account of the steep inclines, each car is equipped with two 50-horsepower motors. Apart from the actual beauty of the journey, the ride is interesting as an example of modern electrical engineering (Belgian).

---

#### ROUMANIA.

[From American Minister John B. Jackson, Bucharest.]

##### New Railway Concession.

A bill has been introduced in the Roumanian Parliament authorizing the district of Prahova to grant a concession for constructing and operating an extension of the private railway from Ploeshti to Valeni de Munte as far as Maneciu-Ungureni, and to contract a loan of 2,500,000 francs (franc=19.3 cents) for the purpose, which is to be issued as necessary. The new line is to be built in two sections, from Valeni to Homoraeni and from Homoraeni to Maneciu-Ungureni, and work on the second section is not to begin until after the first is in operation. The estimated cost of the first section is 1,800,000 francs and of the second section 1,200,000 francs, the income derived from the whole line from Ploeshti being applied in connection with the proceeds of the loan. The object is to open up additional petroleum lands.

---

#### AUSTRIA-HUNGARY.

[From the Wiener Zeitung, Vienna.]

##### Municipal Railway for Carlsbad.

The Austrian Ministry of Railways announces the grant of a concession to the municipal authorities of Carlsbad to construct and work an electric railway in that town. Eighteen months are allowed for carrying out the work.

---

#### ENGLISH RAILWAY AFFAIRS.

[From Consul Benjamin F. Chase, Leeds.]

##### Receipts from Trackless Trolleys.

The cost of constructing trackless trolley systems in England was given by a recent lecturer as \$15,000 per mile of route, as against \$50,000 per mile for the usual rail system. The cost of working is about 11 cents per car mile. Receipts depend upon local conditions. At Leeds they were given as 21 cents per car mile and at Bradford 16½ cents.

##### Leeds Tramway Earnings.

The city tramways last year showed an increase of almost \$2,500 a week in earnings over the year before. The mileage for the year was 8,528,210, an increase of 219,771. [Detailed accounts of the Leeds tramways appeared in Daily Consular and Trade Reports for June 21, 1909, Sept. 23, 1910, and Jan. 10, 1911.]

**Wages and Hours in the Railway Service.**

The Board of Trade in a recent report gave some interesting statistics as to wages of railroad workers. The statistics quoted do not include "other workers" on the railway and give the numbers and average wages (including bonus) of "6-day workers" in the principal grades of adult workmen:

Occupation.	Number paid wages.	Average rate of wages.	Average actual earnings.
Engine drivers.....	26,430	\$9.80	\$11.17
Goods guards and brakemen.....	15,643	6.86	7.34
Passenger guards.....	6,586	6.75	7.12
Signal men.....	26,849	6.17	6.69
Firemen.....	26,029	5.80	6.67
Shunters.....	14,097	5.78	6.23
Porters (goods).....	18,606	5.05	5.31
Laborers (permanent way).....	27,197	4.57	5.27
Plate layers and packers.....	44,355	4.73	5.13
Porters (coaching and traffic).....	18,146	4.54	4.80

The hours of duty in a full week, exclusive of meal time and over-time, for adult "6-day workers" average 58; for engine drivers and firemen, 62 hours; guards, 61 hours; porters, 60 to 61 hours; signalmen, 57½ hours; shunters, plate layers, and laborers, 55 hours. A considerable proportion of railway employees receive allowances of uniform or other clothing, house rent free, etc., in addition to their cash wages. Some of the engineers work on the trip system, and thus make better wages. The newspaper account of this report says further:

For the United Kingdom as a whole the rates of wages of over one-fourth of the adult workmen were less than \$4.87 a week. Nearly two-thirds were rates at less than \$6.09. Less than one-fifth were rated at \$7.30 or over, and only 5½ per cent had rates of wages as much as \$9.73. The number of men rated at less than \$4.87 was about 95,000. These particulars relate to the rates of wages for a full week's work and do not include any bonus earned. The proportion whose actual earnings fell below \$4.87 was 22 per cent; 50 per cent earned less than \$6.09; nearly 29 per cent earned \$7.30 or more; and 9 per cent earned \$9.73 or more.

[A lengthy report on wages paid on British railways appeared in Daily Consular and Trade Reports for Apr. 30, 1908.]

**RAILWAY ELECTRIFICATION IN GERMANY.**

[From the Borsen Zeitung, Berlin.]

The Prussian Landtag has under consideration a memorandum containing comprehensive proposals for electrifying and improving the Berlin city and suburban railways in order to render them capable of dealing with the increasing traffic. With this object in view it is proposed to set up two electric generating stations, one in a lignite district, probably near Bitterfeld, and the other near Berlin, the latter as a reserve station and to supplement the other during the heaviest periods of traffic. The work will involve the laying underground of six pairs of cables of 60,000 volts tension. The total cost of the work, which will take about 4½ years to carry out, is put at \$30,000,000, of which \$12,000,000 is earmarked for permanent way and constructional work, etc., and the remainder for the provision and alteration of rolling stock. It will be necessary, inter alia, to provide 557 electric locomotives and 690 passenger coaches.

[From the London Times.]

**Statistics of Traffic.**

The local services on the Berlin Stadtbahn, which is a portion of the Prussian Government railways, have to deal with a very heavy and ever-increasing traffic, notwithstanding the extensive systems of electric tramways and electric underground and elevated railways serving the city. Since the opening of the Ringbahn, or

inner circle, which connects all the Berlin railway stations, the population of Berlin has shown a tendency to live farther and farther out of the city. In 1895 the Stadtbahn carried over the inner circle 75,000,000 passengers, while in 1909 the number had increased to 157,000,000. The suburban traffic amounted in 1895 to 41,000,000 passengers, while in 1909 it had increased to 137,000,000. The Sunday and holiday traffic is especially heavy on the suburban section.

The population of Berlin itself, served by the circle lines, has increased from 2,017,000 in 1895 to 2,898,000 in 1909, while the population of the suburbs has risen from 382,000 in 1895 to 807,000 in 1909. The number of trips per capita per year has very greatly increased. While the suburban population was carried 107 times in 1895, the number had risen to 170 times in 1909.

#### **Necessity for Electrification—Character of Rolling Stock.**

Under present steam conditions, with the heaviest tank engines admissible, it is not possible to operate more than 24 trains per hour in each direction, each train having a seating capacity of 488 passengers. The minimum service that will meet the requirements of 1916 would be rendered by 30 trains an hour, each seating 610 passengers. As it is impossible to increase the length of the trains and use two engines, electrification has been decided upon, and electric locomotives chosen rather than multiple-unit motor-car trains.

The electric trains at the hours of heaviest traffic will consist of thirteen 6-wheel coaches propelled by two electric locomotives, one in front and one at the rear. During the slack periods the trains will be halved and handled by one locomotive. By fitting the end passenger coach with a controller it will be possible to control and drive the half trains from either end. The use of compartment coaches with side doors has for many years given every satisfaction and enables trains to be rapidly filled and emptied.

#### **Power Stations—Cost of Equipment.**

The locomotives will run on the single-phase system with an overhead contact line pressure of 15,000 volts at 16 $\frac{2}{3}$  periods. This system has yielded satisfactory results on other lines. The power required will be supplied from two power stations. One of these will be located at Bitterfeld on a brown-coal field about 80 miles distant, whence the power will be transmitted by underground cables at a pressure of 60,000 volts. The other station will be in Berlin and will deal with the peak loads. Each is designed for a plant capacity of 100,000 kilowatts.

The estimated cost of the power houses and of the transmission is \$21,420,000, and will be provided by a separate company. Careful consideration has convinced the Prussian Government of the advantage of purchasing rather than producing energy for itself, but it has reserved far-reaching powers of supervision as regards management.

The total capital expenditure, excluding power station, transmission, and substations, is \$11,900,000 for overhead equipment, alterations and additions to stations, repair shops, low-tension feeders, and distribution, and \$17,457,300 for electric locomotives, provision for heating and lighting trains, drivers' compartments, and additional new rolling stock. It is intended to order 557 electric locomotives and 690 additional passenger coaches, with 29 repair and inspection coaches. The whole electrification is to be completed in four and one-half years.

---

#### **NEW LINE FOR BESSARABIA.**

[From Consul John H. Grout, Odessa, Russia.]

In addition to the new railways for South Russia mentioned in Daily Consular and Trade Reports for February 26, 1912, another railway under favorable consideration is a projected line to connect the town of Akerman with that of Leipzig, on the Southwestern Railway, the distance being about 100 miles, and to cost \$3,090,000. This line, if carried through, will be of great benefit to the Province of Bessarabia.

---

#### **RAILWAY BUILDING IN CHILE.**

[From Consul Alfred A. Winslow, Valparaiso.]

For the past year railway construction made good progress, especially on the Arica to La Paz line, the Longitudinal north of Valparaiso, and the Lebu to Los Sauces line south of Concepcion. The

last rail on the former line was laid on March 2, 1912, and it is proposed to open it for traffic in June of the present year.

The first double-track railway bridge ever built in Chile was completed at a cost of \$365,000, after being four years in construction.

The electrification of the first section of the Government railway is still under consideration, after a favorable report by the committee of experts. The Government is moving cautiously, and is studying the different systems. Many believe the work will be begun in 1912.

The Longitudinal to Puerto Montt was practically completed at the close of 1911 and is to be opened to traffic early in the present year. This line opens up a fertile, heavily timbered section of country that will add much to the wealth of Chile.

---

### THE TRAMWAYS OF BUENOS AIRES.

[From Consul General R. M. Bartleman.]

The tramway service of Buenos Aires is unexcelled in the number of enterprises in this direction, the territory served, the cheapness of the passages, and the regularity and speed with which the greatest distances are covered. It is claimed that in proportion to the urban radius and the population there is no other city in the world better served in these respects than the Argentine capital.

The tramways have been an important factor in the progress of Buenos Aires by assisting in scattering the population to the farthest limits of the city and in establishing populous centers which are gradually being brought nearer to each other and forming a part of the whole.

The statistics in this case are a convincing proof of the efficiency of the tramways. These show the enormous development of city traffic. This development is surprising not only when compared with that of other cities, but also when compared with that of Buenos Aires a few years ago. In 1873, when the greatness of the city began to be realized, the tramways carried 13,156,350 passengers; 10 years later, when in the period of the horse cars, the total number of passengers was augmented to 17,965,437; a decade later, due to the increased population of the city, 57,799,362 passengers were carried. With the change from horse cars to electric cars came a great improvement and extension of the systems in all their ramifications, and the number of passengers carried multiplied beyond the most sanguine expectations. During the year of 1911, just past, 355,531,182 passengers made use of the facilities offered, the companies receiving \$14,969,446 (United States gold) in fares.

---

### LUBRICATING OILS FOR BELGIAN STATE RAILWAYS.

Telegraphic advices from American Minister Larz Anderson at Brussels announce the removal of the discrimination which has existed against American lubricating oils in connection with public tenders for supplies for the Belgian State railways. The specifications for supplies have in the past called for Russian oils, thus preventing American oils from competing. The action of the Belgian Government follows representations on the subject of American lubricating oils made by the United States Government.

**CONSTRUCTION WORK ABROAD.****NETHERLANDS.**

(From Consul Frank W. Mahin, Amsterdam.)

**New Hotel Project in Amsterdam.**

Amsterdam has several excellent hotels, ranking as first class, but at times their capacity is wholly inadequate to the demand. In the summer tourist season, it is impossible to obtain accommodations in any of them without engagement long in advance, and this is substantially the case with the minor hotels and the pensions; and in the seasons when buyers of diamonds and tobacco are most numerous the same is true of the first-class hotels, and many such buyers, it is said, go to Harlem and Utrecht for night accommodations.

This condition, it is believed, shortens the stay of visitors to Amsterdam and probably prevents some strangers from coming here at all, and in recent years has given rise to various inchoate projects for new hotels. One of these now seems destined to fruition. Its nucleus is the Philadelphia Hotel on the Leidschekade. This building, with three buildings on its right and two on its left, will be razed or reconstructed for the new hotel. It will have a frontage of about 130 feet, contain 200 beds, and have 45 rooms with baths. The cost of the project and other details are not yet given out, but it is promised by the promoters that the hotel shall be strictly first class.

---

**NORWAY.**

(From the London Times.)

**Big Hydroelectric Power Enterprise.**

An interesting hydroelectric power scheme, calculated to represent a capacity of more than 200,000 horsepower, is proposed in Norway. It is a question of regulating the Aura and Lilledal Rivers and lakes and those of Mardola at Eikisdal. The lakes highest up in the Leeje district are to be dammed up, the Vangsvandet and the Gaut Lake each 5 meters (meter=3.28 feet), and the Aur Lake, 18½ meters, whereby the level of the Grunning Lake will rise 10 meters. The dam below the Aur Lake will be several kilometers long and the most important in Scandinavia, costing some \$1,500,000. The water from the Stordal streams will also be led to the Aur Lake through a tunnel in the mountain rather more than 1 kilometer (0.62 mile) long.

From the Aur Lake either the water is to be led along its natural course to a power station in the Eikis Valley, where the Mardola will also be exploited, or the Aura River will be taken through a tunnel to the Lilledal River and the two exploited together at Haarstad, near the Sundal Fjord, in which case the Aura River would be transferred to another valley. If the former alternative is chosen the water will pass through a tunnel some 18 to 19 kilometers long to a point on the mountain high above the southern end of the Eikisdal Lake, and the Mardola River will be led to the same point through a tunnel some 2 kilometers long. From this point the turbine conduits lead to the power station at Kuhammeren, which will have an aggregate capacity of 163,000 horsepower, of which 143,000 will come from the Aura and 15,000 from the Mardola. The exploitation of the latter will cost some \$1,500,000 and that of the former river some \$8,078,000 if the Eikisdal location is chosen. Thence the power will have to be transmitted some 28 kilometers to the Romdals Fjord. The hills are very steep and it would in many places be necessary to pass the cable through tunnels, a course which would make the transmission very expensive, involving an expenditure of \$1,000,000 to \$1,210,000.

For these reasons the other alternative, that of leading the Aura into the Lilledal River, has been proposed. According to this plan the Mardola River, with its 15,000 horsepower, will remain at Eikisdal, with another 15,000 horsepower from its auxiliaries. In order to take the Aura into the Lilledal a tunnel 5½ kilometers long would be constructed through the watershed separating the Aur Lake and the Sandvandet Lake,

the Torbu Lake, higher up, being regulated by a dam. The waters of the Sandvandet, the Langvandet, and the Osbuvandet would be raised by one large dam, calculated to cost some \$803,000, the Skarvedal River would be shut off and led in a tunnel to some lakes which have their outflow into the Langvandet, so that all the waters of this system would be included in the regulation. When the water from these diverse sources had been collected a tunnel about 11 kilometers long would convey the water from the Holbu Lake to a point above Haarstad. Where this tunnel passes under the Reusvandet River a communication would be formed, so that the water of that stream would also be absorbed by the tunnel.

The Lilledal waters by themselves represent 63,000 horsepower and their exploitation would entail an expenditure of some \$375,000. The Aura by this scheme would yield 122,000 horsepower at an outlay of \$6,000,000. The power station at Haarstad would thus have at its disposal an aggregate of 185,000 horsepower at a cost of about \$10,000,000.

The installation will be attended by some disadvantages; considerable areas will be flooded, and fishing and shooting in the district will be materially interfered with.

### FRANCE.

[From Consular Assistant Bartley F. Yost, Paris.]

#### Building Operations.

A local newspaper devoted entirely to news in regard to the construction of buildings recently published the following notices, which may be of interest to American plumbing and house-furnishing firms. The location, proprietor, architect, and number of stories of each building for which building permits have been asked for are fully indicated:

Avenue de l'Opera, 28 et Rue Gaillon, 6, architect M. Nenot, Rue de la Sorbonne, 17, two stories; Avenue de Segur, 51, proprietor M. Hugon, architect M. Vasseur, Boulevard de Clichy, 62, one story; Impasse de Menilmontant, 23, proprietor M. Rayez, architect M. Morgand, Boulevard Voltaire, 215, six stories; Rue de Tolbiac, 156, proprietor M. E. Regaud, Rue de Villersexel, 1, seven stories; Rue Berrault, 69, proprietor M. Villatte, architect M. Toussaint, Avenue Feix-Faure, 37, one story; Vill-d'Alesia, 6, proprietor M. Sandoz, architect M. Jaccottet, Rue Michelet, 7, one story; Boulevard Lefebvre, 33, proprietor M. Beauvais, architect M. Deloeil, Rue Chama-pionnet, 66, one story; Rue Lefebvre, 2, proprietor M. de Lamothe et Cie., architect M. Thomas, 28 Rue Nollet, seven stories; Rue Lefebvre, 4, proprietor M. de Lamothe et Cie., architect M. Thomas, 28 Rue Nollet, seven stories; Rues Decamps et Eugene-Delacroix, proprietor Mmes. Charvet et Stasse, architect MM. Bertraud et fils, 152, Boulevard Maleherbes, seven stories; Rue du Colonel Renard, 3 and 5, proprietor M. Loewe, architect M. Preslier, Rue de la Villa-Yvette, seven stories; Rue Duhesme, 21, proprietor and architect M. Blaise, Rue Damremont, 62, two buildings of six stories; Rue Hericart, 6, proprietor M. G. Martin, architect M. F. Martin, Rue Mozart, 28; Villa Faucheur, 1, proprietor M. Masson; Rue des Orteaux, 77, proprietor M. J. Leclerc, architect M. Lauton, 126 Avenue Philippe-Auguste, five stories; Rue des Montbeufs, 8, proprietor M. Desgoute, architect M. Foulon, 5 Rue Guilhem, three stories; Rue Raynouard, 14, proprietor MM. P. et E. Verlet, architect M. Plousey, 158 Rue du Temple, two buildings of eight stories; Villa Damremont, 8, proprietor M. C. Louis, architect MM. H. et E. Cambon, 4 Rue Dautancourt, six stories; Rue de l'Escout, 10, proprietor Mme. Vve Rigout fils, architect M. Merle, 29 Rue de la Chapelle, four stories; Rue de la Mare, 93, proprietor Mme. Ricot, architect MM. Moreau et Giraud, 10 Rue Meynadier, five stories; Rue des Ormeaux, 17, proprietor M. Bournazel, architect M. Cottet, 5 Rue Emile-Gilbert, one story.

### RUSSIA.

[From Consul John H. Groat, Odessa; supplementing report of Consul General Snodgrass in Daily Consular and Trade Reports for May 23, 1912.]

#### Proposed Volga-Don Waterway.

The Volga and Don Rivers greatly converge in their lower courses, so that at one point, between Kalach and Tsaritsyn, they are only 45 miles apart. Here they change directions; the Volga flows south-

east into the isolated Caspian Sea, while the Don runs southwest into the Azov Sea, and thus through Black Sea and the Mediterranean, connects with the ocean. From time immemorial traffic has passed across this narrow but comparatively high ground of the Volga-Don isthmus. The traders of the early and middle ages even hauled their craft over this neck of land. Several small attempts have been made to connect these rivers, one historical effort being that of Kassim Pasha in 1567. Then the region came into the possession of Russia, the east to west trade routes at the same time undergoing great changes, and interest in a Volga-Don canal ended.

Since vast and important possessions have been acquired in Central Asia, and since the Baku naphtha industry has developed, Russian interest has grown, and one project after another has been proposed for connecting the Caspian with the outer seas. The latest is Engineer Lyzhin's project for a canal across the isthmus with 10½ feet minimum depth and 137 feet minimum width. The plans include 35 locks, the altitude to be crossed being 150 feet above the Don and almost twice as much above the Volga level. It is not fully clear how and from what sources and at what cost these high-level locks will be filled with water.

In applying for his concession Engineer Lyzhin asks the Russian Government to guarantee the interest on the \$41,200,000 capital necessary. It is stated that 4,734,000 tons of merchandise will annually pass through the canal and pay \$2,708,900. The working expenses have not been made sufficiently clear.

From the viewpoint of critics it is not apparent what the Russian Government can gain through the enterprise. If it must guarantee a profit, the point is made that it might better construct the canal itself. Another suggestion is that the Azov and Caspian Seas could be connected via Manych, where no such high ground is met, where no locks would be required, and where the soft ground could easily be excavated. The distance, however, is much longer, and the cost would be considerable, although the Manych Canal water, running continuously from the Azov to the Caspian, would help to raise the level of the latter, which is nearly a hundred feet below that of the Black Sea.

#### ROUMANIA.

[From American Minister John B. Jackson, Bucharest.]

##### **Railway Works and Municipal Improvements.**

With the beginning of the fiscal year it is announced that work is to commence at once on improving the railway freight yards, station, and docks at Galatz, on constructing a dry dock at Sulina, and on completing the railway from Piatra-Neamtz to Schela-Bistritza on the left bank of the River Bistritza.

The Roumanian Parliament has authorized several cities to contract loans for the execution of local improvements of various kinds and the construction of public buildings, and invitations to submit bids to supply sanitary fittings, etc., are continually being published. While the quantity called for in each case is relatively small, the aggregate is considerable.

## INDIA.

(From Consul Stuart K. Lupton, Karachi.)

**New Hotel in Karachi.**

One of the first evidences of the growth of this city which may be expected as a result of the prospected Trans-Persian Railway is the statement that Khan Bahadur Nusserwanji R. Mehta is to construct a new hotel in Karachi at the estimated cost of 5 lakhs of rupees (\$162,200). Plans have been drawn up by an architect in Bombay, but no further information is at present available.

(From the Calcutta Englishman.)

**Prize Design for the Floating Bridge at Calcutta.**

The expert committee appointed by the port commissioners of Calcutta have awarded the prize of \$15,000 offered for the best design to the German firm, Maschinenfabrik Augsburg Nürnberg A. G., and have recommended the acceptance of their tender. It seems likely that the port commissioners will act on the advice of the committee, which is presided over by their chief engineer, although under the conditions of the competition they are not bound to place the contract with the prize-winning firm. The tenders ranged from \$2,000,000 to \$3,000,000 (there being 17 designs and tenders from 12 competitors, British, German, and American), and that of the German firm is \$2,675,000.

According to the successful design the bridge will be of nickel-steel and will be built in three spans, giving 200 feet of riverway in the center and 500 feet of riverway on each side. The shore spans will be supported on solid ornamental abutments, and there will be two groups of pontoons at each side of the opening span in the center. The bridge will open on the Scherzer rolling bascule system, the arms being raised like those of the Tower Bridge. They will be worked by electric motors, so that only a few minutes will be occupied in opening and closing them. The bridge will be 60 feet wide, with a 12-foot footpath on both sides and with room for a carriage way on each side of the double tramway track in the center.

## CHINA.

(Correspondence from Hankow in the Manchester Guardian; supplementing report in Daily Consular and Trade Reports for Apr. 8.)

**The Reconstruction of Hankow.**

The plan for reconstructing Hankow native city, which was almost entirely destroyed by fire toward the end of last year, shows the town-planning scheme which has received official sanction. The whole town is represented as laid out with perfect geometrical regularity, with the main streets at right angles to each other and other streets crossing them diagonally. The plan is arranged according to the points of the compass, main streets running north and south or east and west. It ignores all the buildings left standing—of which there are not a few—and a fairly good road built some few years ago. All building plots are square and equal, except those which are half size and triangular, where the diagonal streets cut the others. It is not decided when work on the scheme will be begun. The idea seems to be that a foreign loan will be obtained. In the meantime the work of rebuilding is being started in several places just on the old lines.

## WEST AFRICA.

**French Proposal for Railway Construction.**

It is announced that a bill has been introduced into the French Chamber of Deputies to authorize a loan of about \$30,000,000 for various railway and harbor improvements in French West Africa. This includes \$2,000,000 for Dakar and Conakry harbors and surveying operations in connection with the extension of the Ivory Coast Railway, \$5,000,000 for completing the Thies-Kayes Railway, \$3,000,000 for a line from Bamako to Bougouni, \$5,000,000 for extension of the Guinean Railway from Kanka toward Beyla, \$8,500,000 for extension of the Ivory Coast Railway from Bonake in the direction of Comoe, with a branch from Dimbokro toward Daloa, and \$6,500,000 for the extension of the Dahomey line from Savé through Parakou in the direction of Djougou, and of the Grand-Popo line in the direction of Lokossa. The construction of a line from Porto-Novo to Cotonou is included.

**PERU.**

[From Consul General Wm. H. Robertson, Callao.]

**Disastrous Fire at Mollendo, and Possible Substitution of Port by Natarani.**

The port of Mollendo experienced on April 2 a serious conflagration, which destroyed the post office, the State telegraph office, the newspaper office of El Puerto, two hotels, many shops and residences, and other important buildings, the estimated loss being about \$500,000. The customhouse and the American consular agency were not injured.

The question of rebuilding Mollendo has given rise to the serious consideration again of making Matarani the leading port of southern Peru. Owing to the tide, conditions of the current, and the contour of the coast, vessels often have much difficulty in loading and unloading at Mollendo. The Bay of Natarani is 8½ miles to the north, is a much better harbor in every way, and, as a terminus of the Southern Railway, would shorten the run to Arequipa by nearly one hour even for freight trains, thus favorably affecting also all of the Bolivian trade via Peru.

The Peruvian Corporation has had a concession from the Government since 1910 to submit plans for a port in the Bay of Natarani and to build a railway to unite this port with that of Mollendo by tapping the present line from the latter port to Arequipa. The corporation has been actively operating in the meantime under the terms of this concession.

---

**BRAZIL.****Proposed New Harbor.**

A bill to authorize the construction of a new harbor in Brazil for naval purposes, at a cost of \$20,000,000, is reported to be at present before the government, and the Bay of Ilha Grande has been suggested as the most suitable spot. The proposal includes erection of docks and buildings, but the provision of defense and similar work would involve an additional expenditure of \$10,000,000.

---

**CANADA.**

[From Consul Felix S. S. Johnson, Kingston.]

**Proposed Powers for Ontario Hydroelectric Commission.**

A bill has been introduced in the Provincial Legislature of Ontario conferring on the hydroelectric commission the following powers, among others:

To take over existing power-transmission lines and to improve water powers, by assisting municipalities and others in the storage of water, making of sluices, etc.; to regulate the installation of electrical equipment and of wires in all buildings, including private houses; to control absolutely light and power rates charged by municipalities whether these municipalities take power from the commission or not; to direct the disposal of surpluses earned by municipal power plants supplied by the commission; to order all wires under its jurisdiction to be laid underground in cities and towns; with the cooperation of the Dominion Railway Commission, to order to be laid underground all wires in streets where the municipalities construct tunnels or conduits to carry such wires.

---

Consul Horace Lee Washington learns that the supply of second-hand La Plata bags at Liverpool, which was limited at the end of April and consequently selling at 5 cents each, was expected to be abundant in June, with a prospective price of 4½ cents.

## SHIPPING COMPANIES' RESULTS.

[From the London Times.]

The recently issued annual report of the Royal Mail Steam Packet Co. for 1911 shows that the trading profit, after providing for depreciation of the fleet, was \$1,417,178, against \$860,509 in 1910. After providing for debenture interest and depreciation of plant and premises and adding \$194,660 to reserve and a like amount to insurance fund, there was a balance of \$418,996 available for dividend, against \$340,845 a year ago. The amount carried forward was \$54,008, in contrast to \$19,656 in 1910.

The results of the operations of other navigation companies appears in the following statement, in which the net profits have been calculated after deduction of all expenses, including fleet depreciation and debenture interest. In the columns headed "To special appropriations, reserves, etc.," all allocations of a nonrecurring nature are included, as well as depreciation of plant and premises, where separately stated, and the regular or irregular contributions to reserves.

Companies.	Net profits.		To special appropriations, reserves, etc.	
	1911	1910	1911	1910
African.....	\$202,550	\$267,361		
British and African.....	181,304	192,650	\$24,333	\$36,490
Cairn Line.....	375,665	10,088	280,076	
Cunard.....	1,313,736	1,470,228	715,353	827,306
Elder Dempster.....	890,808	930,154	632,645	390,084
Elder Line.....	173,895	185,933	38,932	9,733
France, Fenwick.....	172,761	146,769	58,308	48,066
Gulf Line.....	117	59,376		
Imperial Direct.....	* 380,789	* 218,807		
King Line.....	90,366	24,542	48,139	21,430
Leyland (Frederick).....	639,063	* 28,051		
Mercantile.....	281,342	187,146	152,020	107,063
Moor Line.....	161,539	91,349		
National.....	* 20,610	* 51,020		
Neptune.....	80,531	118,855		

\* For eight months.

\* Loss.

The tabulated figures may usefully be supplemented by a few explanations. As the cause of its diminished profits the Cunard Co. adduces disappointing third-class business owing to diminished emigration to America, and higher working expenses owing to the operation of a larger fleet with higher labor costs, and special expenditure in connection with the dock labor trouble. As to the Imperial Direct Line, formerly the Imperial Direct West India Mail Service, the impossibility of continuing the fast direct service to Jamaica without a substantial Government subsidy led to the laying up of the company's fleet. The mail steamers have now been sold and replaced by vessels of a different type, which are all profitably employed, and last year's debit balance includes the loss incurred on the sale. The Cairn Line's profits were affected by exceptional transactions in both years. In 1910 heavy expenditure incurred in inaugurating a new passenger business and losses due to an accident to one of the company's ships both swamped nearly the whole of the company's profits even after a suspense account had been opened. During the past year the sale of two vessels to the Cunard Co. resulted in a large profit, and the special appropriations include the extinction of the suspense account.

## SHOEMAKING IN CHINA.

[From Consul John Fowler, Chefoo.]

Requests are made for lists of big shoe factories in China, which can not be furnished, for shoe manufacturing among the Chinese is in a most primitive state. Chinese in the ports are now wearing foreign clothing more and more; and it is possible that in time shoe factories which make foreign shoes may be established in China. At present, however, the Chinese use their own materials in manufacturing their shoes.

**FOREIGN TARIFFS.****BULGARIA.**

[Reported by American Minister John B. Jackson, Bucharest.]

**Admission of Edible Cottonseed Oil.**

The Bulgarian Government has removed the prohibition previously in force against the importation of edible cottonseed oil. Under the old law such oil had to be denatured before its admission into the country would be permitted. On May 4, 1912, sanitary regulations for the admission of the edible cottonseed oil were published, with provision for taking effect at once.

**CHINA.**

[From Consul John Fowler, Chefoo.]

**Grain Restriction in Chefoo.**

In March, 1912, the head of the Bureau of Foreign Affairs in Chefoo published an order of which the following is a translation:

After this port was taken by the troops of the Republic soldiers assembled here in clouds. This has made necessary the consumption of an immense amount of grain. The soil of Chefoo and vicinity is not fertile, and last year's crop was an unusually poor one. So the exportation of grain must be prohibited, and it has been decided to place an embargo upon three kinds—corn, millet, and rice. As regards other grain, the regulation is the same as before. It is feared that wicked merchants may secretly export grain, and therefore it is necessary strictly to forbid all, both Chinese and foreigners, in order that there may be food for the soldiers and the people.

**DUTCH EAST INDIES.**

[From Consul B. S. Rairden, Batavia, Java.]

**Exportation of Rice.**

The prohibition of the exportation of rice from the Dutch East Indies, reported in 1911, was removed in January, 1912.

**NICARAGUA.****Change in Basis of Payment of Duty.**

The Bureau of Manufactures has been informed by Clifford D. Ham, Collector General of Customs of Nicaragua, of a change in the basis of the payment of customs duties, which is equivalent to a considerable increase in the customs duties on imports into the country. For the payment of customs duties, which are expressed in the tariff in terms of United States gold, the Nicaraguan Government has accepted the paper currency of the country at the rate of 650 pesos paper, equal \$100 gold. The present change, in effect on April 9, is such that henceforth the Nicaraguan paper currency will be accepted in the payment of the customs duties only on the basis of 800 pesos paper, equal \$100 gold. The actual market exchange value of Nicaraguan paper currency has varied greatly from time to time, but it has uniformly remained lower than that for which it has been accepted for the payment of customs.

This tariff change affects all importations or exportations made at the ports of Corinto, San Juan del Sur, El Castillo, and San Juan del Norte. No change has been made in the silver tariff of 1902, which is still in effect in the Atlantic coast ports of Bluefields (El Bluff), Las Perlas, and Cabo Gracias a Dios.

It is provided that when the new money, based on gold, comes into use, which will be July 1, 1912, or as soon thereafter as the new gold and silver coins are minted, the tariff rates will be expressed in terms of the new money at an equivalent figure.

---

#### PERU.

[From Consul General W. Henry Robertson, Callao.]

##### **Certificates with American Lard.**

A decree of March 20, 1912, specifies that the certificates of inspection accompanying American lard upon importation into Peru may be legalized either by Peruvian consuls in the United States or by United States consuls in Peru, at the option of those interested. [See item on "Analysis of lard" in Daily Consular and Trade Reports, Mar. 9, 1912.]

##### **Concession to Peruvian Steamship Co.**

A decree published in the Boletín de Aduanas for March 9, 1912, extends to the Peruvian Steamship Co. certain privileges in the entry of foreign cargo reaching Callao by its vessels. In the terms of the decree permission is given for all cargo brought to the port by the vessels of the company to be landed at a special customs warehouse for customs inspection. It is provided that those interested may ask for the dispatch of their goods immediately or at any time within 30 days after the packages have entered that warehouse. Before the end of that time the packages will not be placed in regular customs storage.

---

#### ROUMANIA.

[Reported by American Minister John B. Jackson, Bucharest.]

##### **Extension of Conventional Tariff to American Products.**

A Roumanian law has been promulgated extending to imports from the United States the rates of the conventional tariff. For several years past there has been discrimination against American products in Roumania, and the passage of the present law marks the success of the continued efforts on the part of the United States to secure the application of the rates of the conventional tariff to American imports.

---

#### TURPENTINE INDUSTRY IN INDIA.

[From the official Indian Trade Journal, Calcutta.]

The financial results of the turpentine industry in the United Provinces of India are stated by the Forest Administration to be very encouraging. The profit for last year was \$28,000 as compared with \$13,000 for the previous year. The excellent results are due to the phenomenal rise in price, turpentine having reached \$1.07 per gallon in March, 1911, at Calcutta, and rosin at \$2.31 per maund of 82½ pounds, delivered at Cawnpore. The sale of the entire output of rosin for the year ended March 31, 1912, is assured at good prices, one lot of 25,000 gallons of turpentine being sold at 81 cents per gallon, delivered at Kathgodam. The same purchaser is to take the whole outturn of turpentine up to March 31, 1914, at rates based on current London prices for best American oil. Arrangements are being made to considerably extend this industry. All the chir forests of the division have been brought under revised tapping scheme on a 15-year rotation whereby from next year onward 250,000 trees will be tapped every year. In the Almora and Naini Tal district protected forests, a commencement has also been made with about 35,000 trees which are now under tapping. This operation will be extended in these forests, the possibilities of which are enormous.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8807. Agencies for Germany.**—A commission agent in Germany, who was connected with the American consular service in that country for a number of years, writes to the Bureau of Manufactures that he would like to get in touch with American firms producing goods suitable for that country, with a view to securing agencies for the same.
- No. 8808. Locks, safes, and refrigerators.**—An American consul in a Mediterranean country reports that a business firm in his district desires to be placed in communication with American dealers in locks, safes, and refrigerators. Goods which may be retailed at reasonable prices are desired. Correspondence may be in English.
- No. 8809. China and earthen ware.**—A resident of an American consular district in a European country informs the consulate that he would like to get in touch with manufacturers in the United States of china and earthen ware in general, with a view to acting as agent for the American firm. Correspondence may be in English.
- No. 8810. Marine supplies.**—The American minister at Bucharest, Roumania, reports that bids have been invited, to be submitted on various dates between May 15 and June 15, under the usual conditions of guarantee, etc., for all kinds of marine supplies in sufficient quantities to satisfy the requirements of the Roumanian Navy during the fiscal year 1912-13. Information in detail in regard to this matter can be obtained upon application to the office of the Commandant of the Navy at Galatz.
- No. 8811. Paper-bag factory.**—A company has been organized in a foreign country to erect a factory for the manufacture of paper bags from imported paper. The proposed capital investment of the company is about \$50,000. Because of the amount to be saved in duty by importing the raw paper, the lower cost of suitable labor for manufacturing, and the saving of commissions through buying direct from the mills, the company expects to be able to produce bags at a considerably lower cost than they can be imported. An American consul has forwarded a prospectus of the new company. It will be seen from this that about \$15,000 worth of paper-bag machinery is to be purchased, and it might be well for American manufacturers of this class of machinery to communicate with the secretary, whose name appears in the prospectus.
- No. 8812. Steel rails and other accessories.**—The American consulate general at Bangkok, Siam, has forwarded copies of specifications and drawings for tenders for 12,400 tons of steel rails and 1,355 tons of permanent way accessories for the Siamese Railways. Tenders will be opened July 15 and 17, respectively. The papers referred to above can be obtained by interested firms upon application to the Bureau of Manufactures.
- No. 8813. Mineral, lubricating, and cylinder oils.**—An American consul in the United Kingdom reports that he has received a communication from a business firm in his district in which it states that it will be glad to be put in touch with producers in the United States of mineral, lubricating, and cylinder oils. This firm states it has just opened a house in Egypt, and the oils are required for shipment to that country. Payment would be made by the firm in the United Kingdom.
- No. 8814. Paraffin.**—A business firm in a European country has informed an American consular officer that it desires to import American paraffin. References will be furnished. Correspondence should be in French or Italian.
- No. 8815. Designs for monument.**—The American consulate at Kingston, Ontario, Canada, reports that the Public Works Department invites designs for a monument, including pedestal, to cost about \$35,000, to be erected at Ottawa to the late King Edward VII. Designs must be in the form of sketch models in plaster, made at a uniform scale of 1½ inches to the foot; they should be sent to Mr. Eric Brown, Director of the National Art Gallery, Ottawa, Canada, by October 1. Communications should be directed to the Secretary of the Public Works Department.

## FOREIGN LUMBER PRODUCTION AND IMPORTATION.

### GREECE.

[From Consul A. B. Cooke, Patras.]

The consular district of Patras furnishes little domestic lumber of a merchantable grade. The only domestic sources are a few forests of valonia oak, the lumber from which is too full of knots and gnarls to be worked successfully, and some areas of mountain pine of an inferior quality. In consequence, practically all the lumber consumed upon this market has to be imported.

The chief uses of lumber here are for beams and girders of buildings—there are no frame buildings erected—for currant boxes, and for the manufacture of furniture (by hand).

The principal kinds of wood imported are fir, white pine, yellow (pitch) pine, beech, oak, and walnut. The countries of origin of these imports are Austria, Sweden, Turkey, and the United States. Practically all of the fir comes from Austria via Trieste or Russian Black Sea ports, with transshipment. Some oak, pine, and walnut comes from America, but the total imports of these woods from all countries are small, since they are used only in making furniture, which industry is in a primitive state here as yet.

### Prices, Duty, and Imports.

The lumber is imported in boards of varying thickness, width, and length, or in small beams.

The average prices of lumber c. i. f. Patras (exclusive of customs dues and octroi tax) are: Fir, \$12 to \$14 per cubic meter (cubic meter = 35.314 cubic feet), according to form; pitch pine, \$20 to \$24 per cubic meter; beech, planed \$18, undressed \$14; oak, \$14 to \$60.

The customs duty on these woods is: Fir, \$2.62 to \$4.48 per cubic meter, according to form; beech, about \$0.92 per 1,000 pounds; oak, \$5.88 per cubic meter. To these charges must be added a municipal tax of 40 to 80 cents per cubic meter, according to kind of wood.

Customs records show the total amount of lumber of all kinds imported through the port of Patras during 1911 to have been 12,577

cubic meters. This represents perhaps rather more than half of the lumber imported directly into this district through all its ports of entry. The lumber trade is reported by importers to be steadily growing. Inquiries have several times been made at this consulate during the past year with regard to American yellow (pitch) pine and oak.

### SIAM.

[From Vice Consul General Carl C. Hansen, Bangkok.]

The main product of Siam's extensive forests at present is teak, the exports of which for the fiscal year ended March 31, 1911, amounted to 89,165.17 tons, valued at \$2,820,914, against 76,090 tons, valued at \$2,580,771, for the previous year. Teak shipments during 1911 consisted of 61,407.24 tons of squares, 7,484.24 tons of planks, 272.33 tons of shingles, 1,036.35 tons of log and butt ends, 17,351.27 tons of scantlings, and 1,613.74 tons of unenumerated teak.

The distribution of teak to foreign countries for the year under review was as follows:

Countries.	Tons.	Value.	Countries.	Tons.	Value.
United States.....	90.00	\$4,773	Belgium.....	100.19	\$4,357
United Kingdom.....	11,590.66	652,506	Italy.....	1,772.52	79,811
Singapore.....	1,873.75	67,147	South Africa.....	150.00	8,218
Hongkong.....	9,404.74	212,289	Dutch possessions.....	100.00	2,590
France.....	3,094.67	210,027	Cochin China.....	241.56	11,259
Germany.....	1,183.80	58,301	India.....	42,487.15	911,098
Japan.....	2,853.92	101,059	China.....	1,873.42	53,542
Denmark.....	805.56	44,152	All other countries.....	3,201.72	199,215
Austria-Hungary.....	860.16	44,324			
Ceylon.....	0,880.93	156,176	Total.....	89,165.17	2,820,914

### Siamese Woods Other Than Teak.

While teak is the most important product of Siam's forests, and the teak regions are mainly confined to northern Siam, lower Siam and the Malay Peninsula contain many valuable forests of wood other than teak. Among these are rosewood, which in considerable quantities is shipped to Hongkong, Singapore, and the United Kingdom; boxwood, which is valued in Japan for carving; agilla and sapanwood, which are shipped to Hongkong and Singapore.

Foreign firms have lately obtained concessions to work timber areas in lower Siam, and the products of these forests are now beginning to supply the local needs for cheap wood, which is yearly purchased from Singapore in considerable quantities, the imports for 1911 being valued at \$319,431.

The exports of wood of all kinds except teak during 1911 were valued at \$213,217, against \$168,615 for the previous fiscal year, the main points of destination being the United Kingdom, Hongkong, and Singapore.

### GERMANY.

[From Consul Herman L. Spahr, Breslau.]

Certain foreign woods are in constant demand in Silesia because they do not grow in Germany and for the specific purposes of the manufacturing interests can not be replaced by domestic woods. They are hickory, rosewood, mahogany, cedar, *lignum-vitæ*, teak-

wood, ebony, and American walnut, whitewood, and pine. American oak and ash are also sought.

Hickory is indispensable in the carriage factories, especially for wheels that must be very elastic and able to stand heavy strains. There is no domestic wood for wheelwrighting comparable to hickory in strength and elasticity. The prices obtained are limited by the price of finished wheels that come from America. The inland waterways enable local industries to get their wood cheap enough to meet this competition.

Walnut is used in large quantities by the furniture and carriage factories. Oak furniture is made almost exclusively of American wood, since German oak is hard to obtain for this purpose. Walnut and oak are also sought by the piano factories of the Liegnitz district. Whitewood is used as a blind veneer; German poplar does not make a satisfactory substitute. Pitch, red, and Carolina pine are in demand. Cedar for lead pencils and cigar boxes is hard to get from America. Veneers are made of rosewood, mahogany, American or Caucasian walnut, American poplar, etc.

#### AZORES.

[From Consul Edward A. Creevey, St. Michaels.]

Trade conditions in the Azores are peculiar. The islands are small, and at best only a limited business can be done. As to lumber or timber, all of which is from the United States, the islands are supplied principally from cargoes of wrecked and damaged vessels. At least for the past four years this has prevailed, and during the first two weeks of January more than 150,000 feet of timber were discharged from a large steamer that encountered hurricane weather on its way from Mississippi to Europe and put into St. Michaels dismayed and with part of the deck load gone. To effect temporary repairs and permit the vessel to proceed the deck load was discharged and was sold at the low price of 2 cents per foot.

#### AMERICAN TIMBER AND LUMBER INDUSTRY.

A preliminary statement of the general results of the Thirteenth Census of establishments engaged in the manufacture of lumber and timber products includes statistics of: (1) Logging camps, turning out logs, bolts, and such timber products as crossties, poles, posts, mine timbers, and spars, wheel, handle, and excelsior stock; (2) merchant sawmills and planing mills connected therewith, producing rough or dressed lumber, shingles, lath, veneer stock, and cooperage stock; (3) planing mills, not only dressing lumber, but making such articles as builders' finish, sash, doors, blinds, panels, wood mantels, bracket shelves, stair work, screens, moldings, and interior wood-work; and (4) wooden packing-box factories, wherein are made not only wooden boxes or cases, but, among other articles of a like nature, box shooks, berry, cheese, fig, and raisin boxes, egg cases and crates. It does not include small neighborhood mills, sawing exclusively or chiefly for local consumption. The figures are subject to revision.

The general summary shows increases in all the items at the census of 1909 as compared with that for 1904. The number of establishments increased 62 per cent; capital invested, 60 per cent; gross value of products, 31 per cent; cost of materials, 41 per cent; value

added by manufacture, 24 per cent; average number of wage earners employed during the year, 30 per cent; amount paid for wages, 30 per cent; number of salaried officials and clerks, 37 per cent; amount paid in salaries, 49 per cent; miscellaneous expenses, 21 per cent; primary horsepower, 51 per cent; and salaries and wages, 32 per cent.

A comparative summary follows, giving the general statistics for the industry:

	1909	1904
Number of establishments.....	40,671	25,159
Capital.....	\$1,176,675,000	\$733,913,000
Cost of materials used.....	\$508,118,000	\$369,403,000
Salaries and wages.....	\$369,167,000	\$277,652,000
Salaries.....	\$47,428,000	\$31,746,000
Wages.....	\$318,739,000	\$245,906,000
Miscellaneous expenses.....	\$121,338,000	\$100,144,000
Value of products.....	\$1,156,129,000	\$884,512,000
Value added by manufacture (products less cost of materials).....	\$648,011,000	\$524,109,000
Employees:		
Number of salaried officials and clerks.....	41,145	30,042
Average number of wage earners employed during the year.....	605,019	532,629
Primary horsepower.....	2,840,082	1,886,959

#### American Veneer Industry—Wood Imports and Exports.

The reported total quantity of timber of all species consumed during 1910 as veneer material was 477,479 thousand feet, log scale, which was an increase of 9.5 per cent over 1909, 24.8 per cent over 1908, and 37 per cent over 1907. The development of the industry of veneer manufacture has been rapid. In fact, since 1905, when statistics concerning this subject were first separately collected by the Bureau of the Census, no branch of manufacture which utilizes logs or bolts as raw material has made such substantial progress, the total quantity of timber used in 1910 being 163.6 per cent larger than in 1905.

Expansion in the industry during recent years has been due in large part to the development of a distinctly different class of uses of veneers from those for which this stock was originally made. For many years veneers were cut exclusively from the cabinet woods, chiefly imported, and used as a covering for cheaper woods. In fact, the common use of the word "veneer" includes only material thus used as a covering for some other material. In the trade, however, the term is applied to woods cut very thin and not intended for covering, and it is such "veneers" that are increasing most rapidly. In 1910 more than 40 species of timber, mostly domestic, were used as veneer material, and the major part of the output was consumed in the manufacture of baskets, packing boxes, berry crates, barrels, furniture, laminated lumber, etc.

Red gum was drawn upon as veneer material in 1910 to a greater extent than any other species, contributing about one-third of the total quantity consumed in the industry during that year. Yellow pine and maple followed in the order named and contributed 8.4 per cent and 8.3 per cent of the total consumption; respectively. Eight other kinds of wood, all of domestic growth, contributed more than 10,000,000 feet each to the total, and ranked in the following order: Yellow poplar, cottonwood, white oak, birch, tupelo, elm, basswood, and beech. Of the high-priced imported woods, mahogany was used

in largest quantity, followed by Spanish cedar, Circassian walnut, and English oak, in the order named, with relatively unimportant quantities of other species.

Official statistics show that American imports of wood of all kinds and manufactures thereof were valued in the last three calendar years as follows: 1909, \$50,293,509; 1910, \$54,489,711; 1911, \$51,843,283; while the exports for the corresponding 12 months were worth \$72,313,280, \$85,789,033, and \$95,980,868.

---

### **SOUTH AFRICAN LUMBER IMPORTS.**

[From Consul Ernest A. Wakefield, Port Elizabeth, Cape of Good Hope.]

Considerable quantities of timber are imported at Port Elizabeth for the diamond mines in the Kimberly district and the gold mines on the Rand, chiefly for use in underground tunnels and shafts. Some years ago this trade was largely in the hands of American exporters, but now, owing to higher prices of the American product, Baltic deals from Norway and Sweden are used more extensively than American timber. Canadian deals are also used to a considerable extent, both for building construction and in the mines.

Baltic deals are largely used for roofs and floor timbers in building construction. Canadian deals are as cheap, but are handicapped by being obtainable only in 12, 14, and 16 foot lengths. Baltic deals are delivered in full cargo lots by Swedish or Norwegian steamships, while most of the American and Canadian lumber is shipped in comparatively small lots. Baltic flooring and ceiling boards are also imported. A few full-cargo shipments of Oregon pine, with occasionally a little redwood, come from the Pacific coast by sailing vessels, but this trade is much less important than it was a few years ago.

American woods are used for the following purposes: White pine for flooring, shelving, interior finish for dwellings, furniture, cabinet-making, and business blocks; hickory for wagon wheels and implement handles; southern pine for flooring, bed-spring frames, and indoor finishing; oak and ash for furniture and indoor finishing. The importations of these woods, except for mining purposes, are not heavy for several reasons. A large part of the wood manufactures, including furniture and door frames, are imported. Nearly all houses of any importance are built of brick and faced with cement, requiring the use of only a minimum amount of wood. More attention is also being given to local woods, with the result that some of those previously considered of little value are now found to be available for wagon and furniture construction. In this district there is little serviceable forest growth, and the last-named consideration will never be of great importance. The establishment of a depot at one of the principal South African seaports should prove a decided aid in increasing the sales of American timber here.

[The complete report, of which the above is an abstract, giving prices of various classes of lumber, names of dealers, and other information may be obtained from the Bureau of Manufactures.]

---

The Manchester (England) municipal gas committee proposes to borrow \$1,000,000, of which \$300,000 will be spent on mains and service and \$700,000 on meters, stoves, and "gas fires."

**FRUIT BOXES AND SHOOKS.**

[From Consul Robert Frazer, jr., Valencia, Spain.]

**No American Boxes Used.**

There has been practically no importation of boxes, baskets, or shooks from the United States for Valencia fruit packers, although correspondence has frequently been carried on with several of the largest producers of these articles in the United States. The principal obstacle is the price, as, notwithstanding the increasing scarcity of packing materials of domestic growth, the cost of American containers placed c. i. f. Valencia appears to be still slightly above the current values on this market. The packages in which the fruit of this region are put up have acquired certain traditional forms and sizes known the world over, to which imported baskets and shooks would have to conform.

Some trade might be established here in fancy baskets of vencers, etc., for packing mandarins, plums, apricots, grapes, etc. All of these are put up in a variety of expensive fancy packages for export. For the home market, Valencia fruits and vegetables are either transported loose in railway freight cars of two or three stories, with floors and walls covered with rice straw, or in special wicker baskets, made of split cane woven on osier framework. These baskets cost 14 to 22 cents wholesale and hold 56 to 112 pounds of fruit.

[Details of the sizes of orange and onion cases used in Valencia, and a list of dealers handling these boxes in Valencia, may be obtained from the Bureau of Manufactures. Reports on fruit packing at Valencia appeared in Daily Consular and Trade Reports for May 18 and Nov. 23, 1911, and Jan. 23, 1912.]

---

[From Consul Homer Brett, Maskat, Oman, Arabia.]

**American Shooks Supplanted by Norwegian Wood.**

American shooks, which were at one time used here for boxes in which Maskat dates are packed for export, have been replaced by shooks from Norway, which are said to be 30 per cent cheaper than the American product. Three sizes of boxes are used, the 12-pound being 12 by 7½ by 3½ inches; the 60-pound, 18 by 10 by 9 inches; and the cases, 26½ by 12 by 11½ inches. The wood used is about 1½-inch, except the ends, which are of ¾-inch stuff. Practically all of these shooks are supplied to the packers here by the New York fruit importers.

---

[From Consul Theodore C. Hamm, Durango, Mexico.]

**No Market in Durango.**

There is no market in the State of Durango for imported box shooks or cut-up lumber, as there are about 6,500,000 acres of pine and oak timber land in this State. While these timber resources have been little worked up to the present, recent railroad construction into some of the best timber land will make its exploitation easy and economical. At present there is one box factory, run in conjunction with a sawmill about 60 miles from this city, which supplies the local demand for boxes. In this city there is nearing completion a large combined sawmill, planing mill, and box factory, which will have a capacity of 200,000 feet of lumber a day and will use the timber made available by the Llano Grande branch railroad.

[A list of firms near Durango having box factories, forwarded by Consul Hamm, and firms at San Luis Potosi using quantities of imported shooks and lumber, forwarded by Consul Wilbert L. Bonney, may be obtained from the Bureau of Manufactures.]

[From Consul Alexander V. Dye, Nogales, Sonora, Mexico.]

#### **Tomatoes Shipped From Sinaloa.**

Tomatoes are exported from Los Mochis, Sinaloa, in lug boxes and in 4 and 6 basket crates. The tomatoes are wrapped in tissue paper and shipped green in refrigerator cars, but are not iced. It takes about two weeks for a car to reach Philadelphia, and the freight is about \$350 a car. [The names of leading growers may be obtained from the Bureau of Manufactures.]

### **AUSTRALIAN TIMBER INDUSTRY.**

[From Dalgety's Review, Sydney.]

The export of timber from Queensland is not very large, though it is gradually and steadily increasing. There has been during the last 12 months great activity in all the timber-getting centers, and heavy supplies have been made to the local merchants and building contractors.

While there are still importations from the northern rivers, and occasionally from over-sea ports, the stores of timber in the State are so vast and varied that in the ordinary development of the timber industries these importations must cease and Queensland become a large exporter.

There are huge areas of forest land, estimated at 40,000,000 acres, as yet uninspected and unreserved, which will some time be thrown open to the timber getter's axe and the trader's activities. Masses of pine trees, ironwood, gray gum, silky oak, and other valuable timber may be found in many parts of the State, which will be reached as the railroads are extended and the advance of trade and enterprise makes it advantageous to handle them. There are now reserved about 3,000,000 or 4,000,000 acres, and the operations of the timber merchants cover a considerable area, but this is small in comparison with the extent of forest land. The number of sawmills erected near the areas being cleared is increasing, and the annual output is now not far short of 1,500,000 superficial feet, valued at about £750,000 (\$3,650,000).

Not only the abundance but the immense variety of useful woods that the State possesses make the possibilities of a large future export trade very promising. Queensland pines and beeches are unexcelled for butter boxes, house and carriage building, and general joinery work, and the ironbark, black butt, stringy bark, and tallow wood are unequalled for railway sleepers, road paving, and for every purpose where hard and enduring timbers are needed. Such choice woods as silky oak, pencil cedar, rosewood, tulip wood, and red oak, besides many others that are abundant, are unrivaled for furniture making, cabinetwork, and fine veneers. The ample supply of timbers for all purposes, now only fringed by the getters, must make the State one of the great supply centers for the Australian Commonwealth and ultimately for more distant markets. The great waste that has been indulged in here, as in all young countries, is being checked.

Banana and other fruit crates and ordinary packing cases are now often made of woods that would probably sell for £10 (\$48) per ton if there was better supervision of the timber trade and greater care taken in placing such timber on the market. The regulations by which the merchants can secure standing timber, embodying the principles of licenses and sales by tender or auction, and the payment of royalties, are working satisfactorily, and the revenue derived from this source is increasing, but it is evident that much might yet be done to develop the industry.

*Bank merger.*—It is stated from Toronto that consolidation has been effected of the Royal Bank, which has 200 branches, with 24 in the West Indies, and the Traders' Bank, which has 130 branches throughout Canada. This is the third large Canadian banking combination in 12 months.

**FOREST CONSERVATION IN SCOTLAND.**

[From Consul H. D. Van Sant, Dunfermline.]

Scotland contains a considerable number of well-preserved and imposing forests, cared for and protected for centuries; and compared with the wanton destruction of the majestic timber in the Eastern American States and the St. Lawrence district of eastern Ontario, the conservation of woodland on the large estates of Scotland is deserving of special notice and emulation. To this care under the early feudal system must be largely attributed the splendid condition of many of the forests of magnificent oak, spruce, hickory, elm, ash, hemlock, plane, larch, beech, laburnum, chestnut, willow, rowan, and the various wild and domestic trees of comparatively scanty growth.

In the Dunfermline district are several well-wooded tracts, one of them containing more than 5,000 acres, with many trees over 3 feet in diameter. In the north of Scotland is another forest, abounding in protected game and deer, nearly 10 miles in extent, while the country is dotted with the remains of medieval forests. Of the 850,000 acres of privately controlled Scottish forests much is but sparsely wooded, needing protection and reforestation if it is not soon to become entirely destroyed. It is said that 765,000 acres of this area is understocked and much of it going to waste through lack of scientific silviculture.

**Forestry Schools and Officers.**

The well-to-do classes and aristocracy are adopting improved methods in guarding their forest parks, and the authorities on forest culture in Scotland are awakening to the need of more protection to those portions of the dying woods that are without such vested ownership or care. The Department Committee on Forestry in Scotland has recommended the employment of one officer for every 4,000 acres, with a working foreman in charge of every 1,000 acres, the former at an annual salary of \$600, the latter at \$300, and house rent free. These officers are to be trained at a central station, the location for the head forestry school most favored being near Aberdeen. Four lecturers for general instructions on reforestation are to be employed, as at present, with three additional officers in charge of the central demonstration forest. It is proposed that a small number of scholarships be attached to the demonstration school with a training course of one to three years, each scholarship to be worth from \$250 to \$750 per year. No one will be eligible for these scholarships who has not completed a full course of higher study in forestry and taken a degree.

Along with other economic conditions the loss of population through emigration is said to be due in a measure to the almost total destruction of timber in parts of Scotland where coal is not easily accessible. To reforest and preserve this land and to help hold and settle a permanent population, now largely depleted through constant emigration, is in part the object of this beginning of a more extended forest conservation.

---

Vice Consul General James L. A. Burrell states that the Portuguese census taken on December 31, 1911, gives the population of Lisbon as 436,434, an increase of 80,000 over 1900, and of Oporto 194,064, an increase of 26,000.

**FRENCH WHEAT PRICES.**

[From Consul Louis Goldschmidt, Nantes.]

The steady advance of wheat prices since September, 1911, is attributed to (1) an insufficient stock left over from the crop of 1910; (2) a short crop in 1911; (3) the customs duty of 7 francs per 100 kilos (37 cents a bushel) on imported wheat; and (4) bad crops in Russia and countries along the Danube, uncertain expectations in India, late and poor crops in Argentina, and delay in deliveries due to railway strikes. This increase is further explained by the *Chambre Syndicale des Grains* (Board of Trade for Grains): "In 1911 the production of wheat in France reached 111,000,000 hectoliters (314,-989,400 bushels). According to customhouse statistics, 3,710,000 hectoliters (10,528,027 bushels) of foreign wheat were imported or supplied by the previous year's stock. In round figures, this gives a total of 115,000,000 hectoliters; the demand being for 123,000,000 hectoliters, theoretically it was necessary to import 7,500,000 hectoliters (21,283,070 bushels) to make up the difference, less, however, any reserves which might have been kept in stock by the farmers."

At present (Apr. 26) the prices of foreign wheat per 100 kilos (220.46 pounds) are: Australian, 22 francs (\$4.25); Walla Walla, 21.25 to 21.50 francs (\$4.10 to \$4.15); Plate, 21 francs (\$4.05). Some time ago Walla Walla wheat was bought, but this grain is brought by sailing vessels which take two or three months to make the voyage. Two cargoes were purchased at 21.25 francs per 100 kilos, such cargoes being due in French ports in May and June; but as this wheat has been paid for "against documents," or 60 days before delivery, two months' interest at 5 per cent must be taken into account.

The outlook is uncertain, but a prominent member of the chamber referred to expresses this opinion: "Farmers will be occupied until May with spring sowing, and consequently they will make no offer, the more so as they have but a small quantity of wheat in stock. The price will then continue to rise until the arrival of foreign wheats (May-June); but as the quantity of such wheats bought is not known, it is very likely that French merchants will continue to purchase from hand to mouth."

Newspaper dispatches dated May 8 stated that the French Government has decided not to suspend the tariff of 7 francs (approximately \$1.40) per 100 kilos (220.46 pounds), but it may prolong from two to three months the period in which wheat may be imported free on condition that an equivalent weight of flour is exported from France by the importer before the expiration of that period. This will temporarily relieve the market.

The National Millers' Association calls attention to the situation in a special report showing that the present stock of wheat is only 44,000,000 kilos (97,003,400 pounds), whereas it should be several hundred million kilos.

With warm weather and a good crop, however, the situation will ameliorate. In the meantime bread has risen in price and heavy wheat orders have been placed in Argentina, Canada, and Australia.

Consul M. K. Moorhead, of Rangoon, states that the total expenditure for education in Burma during the fiscal year 1910-11 was \$1,414,921 for a total population of 12,000,000.

**OCEAN SHIPPING LINES.**

[From Consul General George E. Anderson, Hongkong, China.]

**India-Pacific Freight Competition.**

The extraordinary activity in shipping between India and China and Japan, particularly between Calcutta and Hongkong, indicated several months ago in the announcement of a new service between Calcutta and Japan via Hongkong by the Nippon Yusen Kaisha over the protest of other members of the Pacific Shipping Conference, is further exemplified in notable shipping changes.

The Apcar Line, which has been sold to the British India Steamship Co., includes some of the largest ships plying between Japan and India and, with the Indo-China Steam Navigation Co., maintains a fortnightly service between Japanese ports and Calcutta via Hongkong, constituting practically the only passenger service between Hongkong and Calcutta direct. The British India Steamship Co. has also established a line between Rangoon and Hongkong and Japan, affording a fortnightly service for passengers and freight.

The matter is of considerable practical importance to the United States, since one of the chief objects of these respective services is the transportation of gunnies and bone meal from India to Hongkong for transshipment to the United States. The freight rate on goods from Calcutta to Hongkong is largely the controlling factor in the trade, as most commodities from India for the United States passing by way of the Pacific, including the commodities named, are handled on so small a margin that any substantial increase in the freight rate would result in an immediate reduction of the trade. This competition in the Calcutta-Hongkong service is now keen and is having a marked effect on the movement of Indian commodities to the United States.

**French Line to Far East.**

The new French mail contract recently made to succeed one in effect for a number of years provides for a fortnightly service of 15-knot ships instead of the 14-knot speed formerly required and for larger ships on the Marseille-Saigon-Hongkong-Yokohama run. There is also established an additional monthly service from Marseille to Haiphong and probably Hongkong to alternate with the same sort of a service with a second French company, the service of all lines therefore furnishing Indo-China with a monthly French mail to Europe.

[From Consul Isaac A. Manning, Barranquilla, Colombia.]

**New Steamship Service for Colombian Ports.**

From May 5 the United Fruit steamers from New York added Puerto Colombia to their itinerary. The plan called for first steamer to touch at Cartagena on May 4, at Puerto Colombia on the 5th, Santa Marta on the 6th and 7th, and returning touch at Cartagena on the 8th, thence to Colon, Jamaica, and New York. This will materially increase the steamship facilities between Cartagena and Puerto Colombia, the port for Barranquilla, and the United States.

[From the Near East.]

**New Service in the Mediterranean.**

The announcement is made that the Austrian Lloyd has decided to inaugurate on June 1 next a new itinerary which is to shorten considerably the journey between Beirut in Syria, Egypt, and Europe, and vice versa. This itinerary will be maintained

till the end of October. The steamers on the Syrian service will leave Beirut on Monday evening for Port Said and Alexandria, where their arrival coincides with the sailings of the boats on the express line running between Alexandria, Brindisi, and Trieste. The arrival at Brindisi and Trieste is timed to coincide with the departures of the trains. Moreover, the hitherto triweekly Tauern express between Trieste and Paris will become daily as from May 1, 1912. The journey from Beirut to Naples or Rome will be six days via Brindisi, and one week to Paris via Trieste.

### RUSSIAN WOOL PRODUCTION.

[From Consul John H. Grout, Odessa.]

From various reports it appears that during the past winter, in all parts of European Russia where fine wool sheep are raised, the flocks were successfully brought through. The majority of these flocks were in this consular district. Fodder was sufficient, the winter moderate, and the animals were in good health at beginning of the winter. In those Provinces east of the Urals, however, whence a great many of the flocks formerly located here were moved, the situation appears different, lack of food and blizzards causing much damage. In this consular district the wool appears to be of good soft staple and is expected to give an ample clip, estimated from a maximum of unwashed wool at 20 pounds down to 5 pounds per head, but giving a fair average. This applies to fine wool.

The clip of coarse wool is expected to be considerably less, and in places where the fodder had to be used sparingly, the clip may be as low as 3 pounds for some individual specimens. The following statement for several years past still applies:

The rent of land is becoming too high for sheep farming on the old lines, so that flocks are being steadily reduced. In some cases the decrease is as much as 30 per cent, or even more. Only in the district of Ismail, Bessarabia, and Rylsk, in the Province of Kursk, are there increases, in addition to a few places outside this consular district, but the rate of increase reported is not sufficiently large to be reassuring.

### NOVA SCOTIA NOTES.

[From Consul General James W. Ragsdale, Halifax, May 2.]

*The coal output* for the first three months of the year increased 150,000 tons, about equally divided between Glace Bay and Sydney mines districts. If markets hold good, the increase for the year over 1911 will amount to 500,000 tons.

*Labor prospects* in all lines seem bright; besides the promised building briskness, unskilled labor should be in fair demand, in consequence of the contemplated expenditure of some \$100,000 by the corporation of Halifax for water-service extension and sewer works.

*Apple shipments* from Halifax for the 1911-12 season eclipse all previous records, the total by all steamship companies being 1,243,443 barrels, against 240,700 barrels for 1910-11 and about 800,000 barrels for 1909-10. Shipments for the past season to various ports were: London, 659,969; Liverpool, 242,725; Glasgow, 147,863; Hamburg, 118,115; Bristol, 28,933; Manchester, 21,090; Newfoundland, 17,017; West Indies, 3,831; South Africa, 3,125; and Habana, 775 barrels. In addition there were shipped from Annapolis 17,547, from Yarmouth 5,250, western shipments 176,150, and to local markets 150,000 barrels, making a grand total from Nova Scotia of 1,592,300 barrels.

**COMMERCIAL PROGRESS AMONG MOROS.**

[From Consul General George E. Anderson, Hongkong.]

The general prosperity of the Philippine Islands at a time when all other portions of the Far East are experiencing more or less industrial and commercial depression is the one notable trade feature at the beginning of the year 1912.

The most significant development, in some respects, is that to be noted in the Moro country in the Province of Mindanao, of which Zamboanga is the capital. Until within the past few years most of this Province was more or less controlled by savages—tribes of wild men known as the strongest, bravest, and most warlike of the Filipino peoples, the last to be brought within the influence of American administration. Eighty-five per cent of the population is still savage or semicivilized, without the least idea of popular government.

The policy of the American administrators in Mindanao, however, has been gradually to show the people the advantages of peace and order, to teach them to cultivate their land and to husband their resources, and to advance as far and as rapidly along the paths of civilization as may be possible for themselves, and particularly to advance the next generation.

**Government Encouragement—Exports of the Province.**

To do this the provincial authorities have established agricultural experiment stations, agricultural schools, model farms, and the like; have taught the people trades and aided their industries; have introduced improved farming machines and implements, where possible, and improved varieties of plants and seeds; and have given encouragement and assistance to the industrial, agricultural, and commercial advancement of the people in every way possible.

Dissatisfied with the manner in which these people were being exploited by local dealers, the Government has instituted a system of selling foreign supplies to the people at cost and has at the same time encouraged them to produce products for sale by providing a ready market for their surplus at prices corresponding with those received for such goods in other portions of the Philippines and elsewhere. The annual report of the governor of Mindanao indicates in a striking manner the result of this policy. The exports of the Province, reported by the governor, have been as follows:

Towns.	1909	1910	1911
Baganga.....	\$33,289	\$16,833	\$31,284
Caraga.....	8,565	18,184	34,836
Cateel.....	14,790	12,640	21,362
Cotabato.....	23,424	69,446	36,321
Dapitan.....	34,587	47,859	39,183
Devao.....	285,538	453,266	448,066
Iligan.....	55,016	41,156	32,482
Jolo.....	317,337	468,675	477,728
Mati.....	24,267	35,957	30,300
Zamboanga.....	200,910	541,340	942,885
Total.....	1,067,693	1,705,356	2,094,477

**Agricultural Possibilities.**

The development indicated and the administrative work responsible for much of the advance are in some respects typical of the entire situation in the Philippines. There are many districts in the islands capable of even more rapid development than the Moro country. Of

this region itself much may be said. Hemp, coconuts, rice, and tobacco are the principal lowland products; but there are unlimited possibilities at various altitudes for coffee, cotton, sisal, rubber, fruits, forage, and cereal plants. All tropical and semitropical fruits do especially well in this Province. Some of those actually grown are the mango, banana, pineapple, coconut, orange, lemon, mangosteen, citron, cacao, pomelo, papaya, lime, fig, breadfruit, litchi, guava, and durian. All garden vegetables are successfully cultivated.

The agricultural experiment-station work for tropical districts in the Philippines is being centered at San Ramon farm near Zamboanga, where work is done by provincial prisoners under the direction of an expert loaned by the Department of Agriculture in Washington. With this farm as a nucleus, with an agricultural school for native boys in each district, and with a system of tribal farming under foreign supervision, provision is made for teaching the coming generation how to farm efficiently and profitably, not only "pacifying" the country, but starting the people to take advantage of their wonderfully rich natural resources. The use of foreign goods, as a matter of course, is greatly on the increase. Naturally, trade with the rest of the Philippines and with the outside world has been the inevitable result, and the development of these Provinces in aid of the native inhabitant is reflected and has resulted in Philippine prosperity.

### ARGENTINE TRADE NOTES.

[From Consul General R. M. Bartleman, Buenos Aires.]

#### **Stock-Raising Industry.**

In a recent publication issued by the Ministry of Agriculture it is stated that according to the latest census there are 29,000,000 head of cattle in Argentina and that this figure has not varied much during the last four years. Taking the increase of stock at 25 per cent in normal circumstances, the expansion of Argentine herds would be 7,000,000 head per annum; but from this must be deducted losses caused by disease, droughts, and other causes, which in the last few years have occasioned an excessive mortality. It is estimated that last year 4,000,000 head of cattle were slaughtered for domestic consumption and 1,000,000 for markets abroad, and it is reckoned that the increase of the Republic's herds amounts at present to only 3.45 per cent. The ministry deems this fact worthy of especial attention. The suggestion is made that a prudent limitation to the slaughtering of cows be established.

#### **Cheaper Passages from Europe—New Steamships.**

The Argentine consul general in Hamburg announces that the German companies have decided to reduce their third-class passage to Buenos Aires to 100 marks (\$23.80).

The Royal Mail Steam Packet Co. now has under construction 5 large twin-screw steamers for a fortnightly intermediate direct passenger service between Liverpool, Rio de Janeiro, and Buenos Aires. The first will arrive here early in June, and on the return trip to Liverpool will make the voyage in 22 days.

#### **Imported Maize for Seed.**

Maize (corn) seed was imported from the United States last year, and such excellent results were obtained that further experiments will be made during the coming season.

**BRITISH PATENT STATISTICS.**

[From Consul General John L. Griffiths, London.]

British official records show that 29,353 applications for patents were filed during 1911, as compared with 30,388 in 1910, 30,603 in 1909, 28,598 in 1908, 28,915 in 1907, and 30,030 in 1906.

There were 2,670 applications for patents received from residents of the United States, 841 from British colonies and possessions, 6,152 from European countries, of which 3,304 were from Germany, 30 from Asia, 21 from Africa, 59 from Argentina, Brazil, Central America, and Mexico; 1 from the Philippine Islands, and 19,579 from the United Kingdom.

Five applications were filed for the revocation of patents worked exclusively or mainly outside of the United Kingdom. In two of the cases revocation of the patent was decreed, in one the application was dismissed, in one the patent expired after the institution of the proceedings, and the remaining case is pending.

**Designs and Trade-Marks—Trend of Invention.**

While there was a falling off of over 1,000 in the number of applications for patents, there was an increase of more than 10,000 in the applications for designs which were made in 1911 as compared with 1910, the totals for the two years being 43,057 and 32,745 respectively. The designs registered in 1911 aggregated 41,581 as against 32,212 in 1910.

In 1911, 9,743 applications for trade-marks were filed and 4,868 registered, as against 10,623 filed and 5,722 registered in 1910.

The Comptroller General thus describes the trend of invention in 1911 in his report:

The ever-increasing importance of means of locomotion to the community in general is demonstrated by the prominence this subject takes under an analysis of the whole field of inventive activity. The internal-combustion engine, an important factor in the science of locomotion, is greatly in evidence, particularly in connection with the revolving cylinder type and the so-called "valveless" engine, in which poppet valves are dispensed with. Wheels for vehicles are a still more prolific source of invention. Motor vehicles and motor cycles maintain their claim to attention, variable-speed gearing, clutches, and engine-starting devices being especially noteworthy. Aeronautics declined in comparison with the previous year, but the number of applications is still sufficiently great to make the subject one of the outstanding features of the year's inventions. It is interesting to note that efforts are being made to utilize aeroplanes as auxiliaries in naval warfare by contriving means for launching them from the decks of battleships. In view of the recent dispute in the taxicab industry, it is significant that many applications were received dealing with the registration of "extras."

**Industrial Inventions.**

In the textile industry the most noticeable feature of interest is the remarkable number of inventions designed to obviate the objectionable habit known as "kissing the shuttle"; that is, threading the web by drawing or sucking it through the shuttle eye by the breath. To avoid this, the shuttle is so constructed that it can be threaded by hand, or special suction or other devices are provided for threading existing shuttles. Efforts are still being directed toward abating dust and improving ventilation in the carding room of spinning mills. Chemical and fermentation processes for extracting fiber from flax, ramie, and other plants, both for spinning and paper making, are also worthy of remark.

In the chemical industry considerable activity has been shown in connection with the synthetic production of india rubber and of ammonia, the catalytic reduction of unsaturated fats, oils, and the like, and the production of dyes of the anthracene series.

Increasing attention is being given to the utilization of the gyroscope, more particularly in its application as a substitute for the magnetic compass, and in its use as an anti-kidding device for vehicles and as a stabilizing means for flying machines.

## FAR EASTERN TRADE NOTES.

[From the London and China Telegraph.]

**New bank.**—A project is on foot among the business men of Fusan, Korea (Chosen), for establishing a commercial bank with \$250,000 capital.

**Coconut growing.**—The Malanao Coconut Co. (of Manila), capital \$100,000, formed to develop a large plantation on the island of Pandanan, plans to plant a grove of at least 100,000 trees.

**Canton-Hankow line.**—A Canton correspondent who has returned from a visit to the North River says the Canton-Hankow Railway construction is being pressed forward, and on March 19 was to be opened for traffic to the mouth of the Lienchow River, which will give a run of over 70 miles from Canton.

**New coins.**—The new Chinese Republic dollars will, it is understood, bear two lions and the Chinese characters for "one dollar" on one side, and on the reverse the characters "current money," "Chinese Republic," with a wreath of flowers. The Peking Daily News says that a sample coin has been approved by Yuan Shih-kai, and minting will begin at once.

**Chinese Pullmans.**—The first of the two sleeping cars to be used in the service between Shanghai and Nanking was available for the first time on the train that left Shanghai at midnight on April 11. The car, designed by E. J. Dunston, is well built, roomy, and neatly fitted. Its full length is 68 feet, and its width 10 feet 7 inches. The bunks are 7 feet long.

**Amusement enterprises.**—The revolution has brought about a renaissance in art and amusements. The number of places of amusement in Shanghai have increased to an astonishing extent within the past few months. A big theater has just been built at Shanghai, and a number of modern Chinese dramas are to be staged, for the production of which 80 Chinese actors have been engaged at Peking and Tientsin.

**Siberian freight rate.**—Representatives of the Japanese and Russian railways have been sitting in conference at Vladivostok with a view to arranging for a through traffic rate for exports of Japanese silks to Europe. Hitherto silk has been shipped via the Suez Canal, and has taken about 45 days in transport. By the proposed new arrangement it will go via Siberia to Berlin in 13 days at the through rate of 5.52 rubles per pood (\$7.88 per 100 pounds).

**Artillery order.**—Arnhold, Karberg & Co., representing an Austrian syndicate, has signed a \$2,200,000 loan with the Chinese Board of Finance. The loan bears interest at 6 per cent, and is issued at 95. The contract has been indorsed by the army and navy boards, secured on the Peking octroi and redeemable at par five years hence. In return for this accommodation the Chinese Government engages itself to order from the Skoda works artillery of the full value of the loan.

**Colonization profits.**—A Seoul telegram states that the net profits realized by the Oriental Colonization Co. during the current business term is \$272,000, and that when the sum brought over from last account, amounting to \$225,000, and the Japanese Government grant of \$150,000 is added, the total profits will reach \$647,000. The authorities of the Government General of Korea concerned are now making investigations relating to the distribution of dividend. [The formation of this company was announced by American Ambassador O'Brien in Daily Consular and Trade Reports for Mar. 22, 1909. The Bureau of Manufactures has in its files for public inspection the translated articles of organization of the company.]

**Coal-mine consolidation.**—The agreement for amalgamation of the Kaiping and Lanchow coal-mining companies, signed in January last, has been ratified by the Chinese Government and the British minister. The combination will be called the Kai-lin Mining Administration. The Kaiping company receives 60 per cent of the profits and the Lanchow company 40 per cent up to a total of \$1,500,000, above which there will be an equal division. On the expiration of 10 years the Lanchow company will receive the right of purchasing the whole of the Kaiping properties at a price to be arranged.

[From London Financial Times.]

**Peking syndicate steamer.**—There has just been launched at Port Glasgow, Scotland, the first steamer of the coal-carrying fleet of the Peking syndicate. The vessel is 275 feet in length, 44 feet in breadth, and 21 feet 6 inches in depth, and is to carry 3,000 tons dead weight. It has several novel features in arrangement and equipment, including Temperley transporters for loading and discharging. The vessel was named *Sir Richard Audry*, this being the name of the chairman of the syndicate.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

**No. 8816. Novelties and specialties.**—The Bureau of Manufactures is in receipt of a communication from a foreign legation stating an engineer in a European country, whose ability and references are said to be good, wishes to take up the agency of some American novelties and specialties, and would therefore like to get in touch with manufacturers of novelties in machinery, as well as of products of the electro-technical and chemical-technical lines, or of some other similar articles which might find a ready sale in the country in question. He is not, however, looking for heavy machinery. Correspondence should be directed to the legation which furnished the information.

**No. 8817. Revolving electric bridges.**—The American consul at Montevideo, Uruguay, reports that tenders are being called for for furnishing and placing four revolving electric bridges, weighing 3,300 pounds and 2,493 feet of way, as per conditions on view at the office of Traffic and Conservation of the Port Works Council of Montevideo. Tenders will be received until June 20, 1912.

**No. 8818. Railway equipment.**—The American minister at Bucharest, Roumania, reports that the "Direction des Chemins de Fer Roumains," Bucharest, would like to receive communications from interested American manufacturers (no middlemen), to whom it would be prepared to send invitations to submit bids for equipment from time to time as required. Manufacturers should send references and catalogues in making their request to receive such invitations, and should state the railways, American and foreign, for which they have already supplied equipment.

**No. 8819. Agencies for American goods.**—An American consular officer in a Latin American country reports that a resident of his district will be in the United States for the next few months and will be pleased to make agency connections with American manufacturers of sawmill and woodworking machinery, pumps, pipe, fencing wire, cement, building materials (principally steel), electric plants, small turbines for water power, canning machinery, ice machinery, and other articles that find a sale in a new country where the principal industries are logging, sawmilling, and cattle raising. He would also be pleased to meet persons interested in the purchase of timber forests and cattle ranches in a South American country.

**No. 8820. Apples.**—A report from an American consulate in the United Kingdom states that one or two large wholesale fruit dealers in that country desire to get into communication with either the apple growers or packers in the United States with a view to making direct purchases. Correspondence regarding this matter should be mailed direct to the consulate in question.

**No. 8821. Petroleum pipe line.**—Supplementing previous reports on the subject, the American minister at Bucharest, Roumania, writes that the law for the construction of a pipe line from Baicoi to Constantza was enacted by Parliament recently. The preliminary study is expected to take about three months, after which bids for material will be invited. It is probable that a commission will be sent to the United States in connection with this study. The "Director des Chemins de Fer Roumains," Bucharest, would like to receive communications from American manufacturers, together with references and catalogues showing the character of the material which they are prepared to furnish. Subsequently invitations to submit bids will be sent to such manufacturers direct, but only to the actual producer and not to any middleman or intermediary agent.

**No. 8822. Portable iron houses.**—An American manufacturing firm writes to the Bureau of Manufactures that one of its correspondents in a West African country is in the market for portable iron houses. American manufacturers of such articles should communicate direct with the foreign inquirer.

**No. 8823. Shooks and packing cases.**—An American consul in England reports that inquiries have been received at the consulate for the names of firms in the United States exporting shooks and packing cases, with a view to importing the same.

## FRENCH COMMERCE DURING LAST YEAR.

[By Consul General Frank H. Mason, Paris.]

The year 1911 was one of industrial and commercial prosperity, not only in France but all the world over, and if the disturbing political factors of the last half of the year only seemed to affect the financial situation, it is because industrial and commercial prosperity or depression depend upon deeper lying and more durable causes than those created by diplomatic and political influences. Increased railway returns, expansion of foreign trade, and augmented revenue from indirect taxation showed that the year 1911 was one of activity and progress, maintaining and extending the industrial and commercial revival which 1909 began and 1910 confirmed.

The adverse effects of the bad cereal and wine crops of 1910 continued to be felt in a marked manner during the early part of the year, and the unsatisfactory harvests which again ensued from an over-dry summer did nothing to alleviate the situation, which was moreover aggravated by an extensive outbreak of the foot-and-mouth disease among domestic animals. France, which under ordinary circumstances is not only self-supporting but exports agricultural products, was once more compelled to obtain supplies from other countries. The value of the imports of foodstuffs for the year increased over \$120,625,000, while the exports decreased some \$31,845,000, which means a large loss to the agricultural interests.

The effects of this deficiency manifested themselves in a decrease in the deposits with the savings banks, the increase in the cost of living, and unfavorable foreign exchanges caused by a disturbance in the balance of trade.

### Official Discount Rates on the Money Market.

The money market during the first part of 1911 was free from any unusual features. The year opened with an official discount rate of 3 per cent in Paris, 4½ per cent in London, and 5 per cent in Berlin, but, as is usual, the monetary conditions became gradually easier as the year advanced, and after two reductions of one-half per cent—

one in January and the other in February—the Bank of England rate fell to 3 per cent on March 9; while the Reichsbank put its rate to 4 per cent on February 18. Nothing of any moment disturbed the financial horizon until the beginning of July when the relative tranquillity of the first six months of the year gradually gave way to a period of disquietude and uncertainty. The general industrial and commercial situation was but little influenced, but the money market was soon affected.

The banks, as a precautionary measure and in view of a loss of deposits, found it necessary to reduce considerably their loans to the stock exchange and called in their temporary loans from abroad, especially from Germany. The withdrawal of French deposits from Germany caused considerable comment at the time. It is difficult to estimate the amount of these withdrawals, but it is considered that they did not exceed 320,000,000 francs (\$61,760,000) and the embarrassment caused to the German money market was apparently less than was thought, especially as the Germans were able to a great extent to counteract these withdrawals by borrowing considerably from New York.

The Bank of France declined to pay gold except in a limited quantity against its notes, signs of hoarding became evident, and as conclusive evidence of the tension existing, the Bank of France on September 21 raised its rate of 3 per cent, at which figure it had stood since January, 1908, to  $3\frac{1}{2}$  per cent. The monetary tension continued, although loans for stock exchange operations were considerably curtailed and foreign credits withdrawn.

#### **Bank Rates of France and Other Countries—Gold Supply.**

As previously stated, last year witnessed the only change in the official bank rate since January, 1908, whereas the rate was changed four times in London and three times in Berlin. The discount rate of the Bank of France has undergone but 11 changes since 1898, with a maximum of  $4\frac{1}{2}$  and a minimum of 2 per cent, while in England it has varied 73 times in the same period, with a maximum of 7 per cent and a minimum of  $2\frac{1}{2}$  per cent; in Germany it has changed 57 times, with a maximum of  $7\frac{1}{2}$  per cent and a minimum of 3 per cent; in Austria 22 times, ranging from  $3\frac{1}{2}$  to 6 per cent; in Switzerland 55 times, ranging from 3 to 6 per cent; in Belgium 37 times, ranging from 3 to 6 per cent; and in the Netherlands 30 times, ranging from  $2\frac{1}{2}$  to 6 per cent.

The stock of gold at the Bank of France at the end of last year was valued at \$615,670,000, a decrease of \$14,089,000 compared with the same period in 1910, which decrease is ascribed to the unfavorable foreign exchanges ruling during the first months of the year.

#### **Bank Notes in Circulation—Crossed Checks.**

The average circulation of bank notes for 1911 was 5,243,375,000 francs (franc=19.3 cents), and the maximum 5,574,198,000 francs. The legal maximum amount of notes which the Bank of France was permitted to have in circulation at any one time was 5,800,000,000 francs, but owing to the exigencies of the situation this limit was closely approached, and Parliament passed a law raising the legal maximum to 6,800,000,000 francs. The issue privilege of the bank, which was approaching termination, has been renewed until 1920. The bank, in consideration of this renewal, has agreed to increase to 200,000,000 francs its permanent and noninterest-bearing advance to

the State Treasury and has undertaken to make certain extensions and improvements in its relations with the public.

The practice of crossing checks, which has existed in France for some time, received official recognition by a special law passed for the purpose at the end of December and based upon that existing in England. This law will not, of course, cause any change in the status of the check, but simply provides an additional safeguard which can be used when desired, rendering it necessary that a crossed check should be presented for payment by a banker. It remains to be seen whether this change will assist in extending the use of the check in this country, which up to the present has been relatively restricted. However, before the full benefit of the check system with its currency-saving effect can be felt, the bankers' clearing house in Paris, which is now only operating in a comparatively limited manner, will have to be considerably developed.

#### **Operations on the Paris Bourse.**

The Paris Bourse was normally active during 1911, but there was a diminution in the amount of new securities listed compared with the previous year. During the first part of the year new issues followed in rapid succession, and the output bid fair to rival 1910, with its enormous total of about 6,000,000,000 francs (\$1,158,000,000) of new securities. The total amount of new issues on the official and outside markets was about 4,800,000,000 francs (value as per first quotation). The so-called "gilt-edge" securities giving a fixed revenue, such as the governmental, municipal, and railway bonds, again showed decreased quotations. Owing probably to the increased cost of living, the public has turned to securities which, if not perhaps offering the same guaranty, give a more liberal return on the capital invested.

The 3 per cent French rente closed the year at 94.50, as against 97 at the end of 1910, an appreciable decline on a security of this character, and similar reductions occurred in the quotation of the bonds of the railroads, Ville de Paris, and the Credit Foncier. The unsatisfactory harvests of the past two years have resulted in decreased deposits in the savings banks, and the French rente was accordingly deprived to a certain extent of the support resulting from the investment of these funds in the Government security, which partially explains the drop in the quotation of the French rente.

French industrial and kindred stocks in a large majority of cases showed increased prices at the end of last year compared with the same period the previous year, and although these stocks no doubt felt the reactionary effects during the latter half of the year, owing to the foreign political situation, the soundness of the industrial and commercial situation was able to resist the depressing influence.

The general tendency of the stocks of the principal credit establishments and banks was upward, although the securities of some of the principal institutions were at a lower figure at the end of last year than in the previous year. This irregularity was probably due to the different issue operations with which each particular bank happened to be associated.

#### **French Railway Stocks and Bonds—Suez Canal Shares.**

The traffic returns of the French railway companies were satisfactory during last year. Except the Orleans, the stocks of the three most important companies—the Nord, Paris-Lyon-Méditerranée, and the Est—showed increased quotations at the close of the year com-

pared with the same period the previous year, while the Orleans, the Midi, and the Ouest-Etat showed decreased quotations. However, the figures for the first three named companies were not up to those of 1909.

The bonds of the railway companies all show lower quotations for the year, and the intention of the Government to arrange shortly for a large issue of 4 per cent bonds at par by its own line, the Ouest-Etat, is a sufficient indication of the inducements it is necessary to offer in order to get the public to subscribe to fixed interest-bearing securities. The net revenue from the 4 per cent bond would be only a little over  $3\frac{1}{2}$  per cent after deducting taxes, and therefore gives practically the same security as the 3 per cent French rente, which, however, is not subject to taxation. The average quotation of the 3 per cent bonds of the following railways at the end of last year was: The Nord, 424 francs; Lyon, 415 francs; Est, 419 francs; and the Ouest, 424 francs.

The Suez Canal traffic returns constitute a good barometer of the general activity throughout the world. In spite of the decrease in the passage rate inaugurated at the beginning of January, 1911, the year showed considerable increase in the total tonnage dues, and the shares of the company stood at 5,925 francs at the end of December, against 5,525 francs at the same period in 1910.

#### **American Securities at Paris.**

One of the most interesting features of the year was the introduction of three important American stocks upon the official market of the Paris Bourse, viz, the Atchison, Topeka & Santa Fe Railway Co. (common), the American Telephone & Telegraph Co., and the Philadelphia Co. Although several American stocks, such as the Utah Copper, United States Rubber first preferred, Virginia-Carolina common, etc., have been introduced upon the "Coulisse," or outside market, no American stock had ever been accepted on the official market, and the listing of the three above-mentioned securities, in the face of considerable technical and other difficulties, may be considered an event of some significance. The Atchison, Topeka & Santa Fe Railway Co. is the first and, up to the present, the only American railway stock quoted on the Paris Bourse. There has been a fairly active market for these three stocks, but the continuous downward tendency of the New York market since their introduction here has not of course encouraged transactions in Paris.

Two issues of American railway bonds were made here during 1911 and admitted to the official market, viz, \$40,000,000 Central Pacific Railway 4 per cent bonds and \$7,000,000 St. Louis & San Francisco Railroad 4 per cent bonds.

#### **Rates of Exchange.**

The high level of the sterling rate of exchange which existed throughout 1910 continued during 1911, especially for the first half of the year, during which the full effect of the necessity, owing to the previous bad harvests, of importing instead of exporting foodstuffs was felt. The average rate for the first three months was 25.29, or 7 centimes above the mint par of exchange, and 25.30 $\frac{1}{2}$  for April, May, and June. The lowest rate recorded during the first six months was 25.25 $\frac{1}{2}$ , which is noteworthy when it is remembered that for years previous to 1910 the average sterling rate was continuously below the mint par of exchange of 25.22. During the second half of the year the monetary disturbance resulting in the withdrawal to a consider-

able extent of French foreign deposits and the increase in the discount rate of the Bank of France appreciably modified the rate for sterling. The highest rate of the year was 25.32½ and the lowest 25.14.

The exchange rate for the American dollar, which during 1910 increased from 5.17 francs in January to 5.20½ francs in December, opened the year with 5.20, at which level it remained until about August, when the same downward movement manifested itself as with the sterling exchange. The months of October and November witnessed the lowest average rate of the year, viz, 5.16½, increasing to 5.18½ for December. The highest figure for the year was 5.20½, and the lowest 5.16½.

#### Import and Export Trade of France.

The provisional statistics recently published, which as usual will be subject to revision before being embodied in the permanent record, show that the total foreign commerce of France in 1911 was valued by the customs authorities at \$2,766,219,592, of which \$1,575,008,731 represented imports and \$1,191,210,861 exports. Compared with 1910 the imports increased \$270,357,681 and exports \$32,104,006, and the aggregate foreign commerce of 1911 exceeded that of any previous year.

The total values of imported and exported merchandise, as classified in the French returns, show the following comparison between 1910 and 1911:

Classes.	Imports.		Exports.	
	1910	1911	1910	1911
Food products.....	\$244,501,471	\$384,037,576	\$150,741,492	\$139,971,320
Raw materials.....	800,199,809	895,322,947	347,194,069	370,907,810
Manufactures.....	250,949,770	295,648,208	566,174,957	586,165,473
Postal packages.....			94,996,387	94,165,858
Total.....	1,304,651,050	1,575,008,731	1,159,106,855	1,191,210,861

The total duties collected on imports in 1911 amounted to \$143,-889,220, an increase of \$36,616,928 over the previous year.

#### Distribution of Foreign Trade.

The values of imports into and the exports from France during 1910 and 1911, respectively, by countries, are shown in the following table:

Countries.	Imports from.		Exports to.	
	1910	1911	1910	1911
United States.....	\$108,816,295	\$170,445,634	\$81,762,713	\$76,542,835
Algeria.....	62,701,840	88,305,230	84,661,959	83,533,204
Argentina.....	55,859,990	70,420,875	30,802,244	33,179,981
Austria-Hungary.....	16,384,349	16,632,740	8,506,536	8,918,144
Belgium.....	90,864,400	102,869,193	185,823,681	197,343,079
Brazil.....	28,743,683	29,926,773	12,897,418	15,118,076
Germany.....	158,581,345	186,261,596	147,481,529	158,078,773
Italy.....	36,155,076	26,260,261	63,231,046	55,636,882
Russia.....	63,944,181	79,639,713	15,346,538	10,703,973
Spain.....	36,531,812	43,954,795	27,311,916	26,558,730
Switzerland.....	26,366,898	27,435,529	73,061,694	77,769,157
Turkey.....	18,147,597	19,324,161	13,730,935	15,856,108
United Kingdom.....	173,401,236	197,019,611	237,537,452	240,667,140
Other countries.....	428,152,358	506,502,638	176,790,194	181,304,779
Total.....	1,304,651,050	1,575,008,731	1,159,106,855	1,191,210,861

Thus the imports from every country given above increased, compared with 1910, and the exports to all countries except the United States, Italy, Russia, and Turkey show a more or less important growth over the preceding year. The apparent loss in exports to the four countries named was due almost exclusively to reduced shipments of food products.

#### Imports from United States.

From the foregoing table of totals it will be seen that according to French statistics the imports into France from the United States showed an increase of \$61,629,339 over 1910. The following table gives the provisional figures for the two years, with the various imports classified into groups according to the division of the French tariff:

Articles.	1910	1911	Articles.	1910	1911
Automobiles and parts...	\$218,862	\$483,465	Phosphates, crude.....	\$699,818	.....
Bran.....	143,785	20,143	Provisions:		
Cereals and flour.....	1,670,222	6,442,919	Fats.....	\$375,000	\$3,004,468
Chemicals.....	247,812	375,578	Meats.....	139,503	1,026,567
Coffee and cocoa.....	374,999	612,582	Rubber, and manufac-		
Copper, crude.....	14,204,545	16,333,011	tures of.....	2,841,732	5,526,363
Cotton, raw.....	57,227,202	93,326,308	Seeds and plants.....	84,148	.....
Feathers.....	216,353	380,403	Shells, pearl, etc.....	230,240	529,206
Fruits.....	430,390	391,404	Sponges.....	371,718	347,014
Hair, animal.....	71,410	.....	Tobacco, raw.....	2,950,005	3,050,944
Hides and skins.....	2,560,531	1,678,328	Whalebone, crude.....	280,815	204,580
Leather, manufactures of.....	427,109	1,470,274	Wood and manufactures		
Machinery.....	6,959,060	10,222,824	of:		
Nickel, ingots.....	452,392	1,075,240	Common.....	2,937,663	4,527,587
Oil:			Exotic.....	247,426	452,199
Cottonseed.....	228,126	1,468,537	Furniture.....	248,365	307,256
Mineral and gasoline..	3,184,896	8,428,117	All other articles.....	5,366,172	5,927,030
Oil cake.....	673,377	1,052,815			
Pearls.....	671,640	671,473	Total.....	108,516,295	170,445,634

From the foregoing summary it will be seen that with the exception of seven or eight relatively unimportant articles, there was a more or less important increase in every class of imports from the United States. The increase of \$36,099,106 in the receipts of raw cotton, more than \$5,000,000 in mineral oils and gasoline, and more than \$2,000,000 in raw copper, attest the prosperity of French manufacturers, while the greatly enhanced imports of cereals, flour, provisions, and meats reflect the diminished production of certain food materials in this and other European countries upon which France has been accustomed to rely in order to supply casual deficiencies.

#### Shipments to the United States.

The provisional statistics of the total French exports to the United States; as shown in previous table, are so inaccurate that the items are omitted from this report. They are merely estimates made by a commission, which assumes a mean average value per kilo for each kind of merchandise, and obtains a theoretical result by multiplying this unit by the number of kilos of each kind of goods exported. Such a system breaks down completely when applied to works of art and other highly valuable and often unique articles which form an important part of French exports to the United States.

The only statistics which show with substantial accuracy the real values of French exports to the United States are those derived from the records of American consulates in France, at which are declared and certified the invoices which cover all shipments exceeding \$100

in value. They are imperfect only in that they do not include shipments below that limit, or the large quantities of clothing, ornaments, jewelry, furs, etc., which are bought here by American visitors and taken home as personal effects without consular invoice. The value of the articles as declared by shippers and certified at the 15 American consulates in France for shipment to the United States and possessions during last year was \$119,584,060 against \$121,895,566 for 1910. [A report on the export trade, by consular districts, was printed in the Daily Consular and Trade Reports for Feb. 20, 1912.]

French exports to the United States are largely manufactured goods, in which the element of skilled labor forms the principal item in the cost of production, whereas about 80 per cent of American exports to France are food products, raw cotton, copper, mineral oils, leaf tobacco, etc., which are either necessities of life or raw materials which are indispensable to French manufacturers.

As already stated, the year 1911 was a disastrous one for certain agricultural products, owing to the drought which did not seriously affect the earlier cereals. The area under cultivation, the output, and the imports of cereals compared with 1910 were as follows:

Products.	1910			1911		
	Acreage.	Production.	Imports.	Acreage.	Production.	Imports.
		<i>Bushels.</i>	<i>Tons.</i>		<i>Bushels.</i>	<i>Tons.</i>
Wheat.....	16, 113, 539	262, 890, 144	634, 895	15, 644, 665	304, 597, 579	2, 143, 430
Rye.....	4, 259, 935	44, 976, 677	53, 334	2, 874, 786	45, 907, 312	94, 849
Barley.....	1, 842, 447	36, 512, 609	120, 759	1, 912, 604	47, 320, 711	203, 008
Oats.....	9, 698, 321	190, 678, 314	381, 171	9, 983, 087	296, 150, 388	543, 634

The output of beet sugar last year was 515,000 metric tons, compared with 711,172 tons for 1910.

#### Shipping Statistics.

The returns of navigation show that there arrived in French ports during 1911 a total of 7,690 French vessels, of 7,138,170 tons register, and 20,493 ships, of 22,278,220 tons burden, under the flags of Great Britain, Germany, and other foreign nations. This was an increase of 487 vessels of 1,184,548 tons over the previous year.

The clearances included 6,946 French vessels, of 6,623,511 tons, and 13,860 foreign vessels, of 15,931,835 tons aggregate capacity, a decrease of 74 French vessels and 34 foreign vessels as compared with 1910, but an increase of 369,823, and 264,965 tons, respectively, in their tonnage, and illustrates forcibly the steady increase in size and tonnage of merchant craft since steam has so largely displaced sailing ships in international trade.

#### Cost of Living in Canada.

Consul Harry A. Conant quotes the following market prices as showing the high cost of living at Windsor, Ontario: Potatoes, \$1.60 per bushel (against 60 cents a year ago); butter, 35 cents; eggs, 23 cents; lard, 16 cents; bacon, 20 cents to 23 cents; round steak, 16 cents; sirloin steak, 20 cents; porter house, 25 cents; pork, loin chops, 20 cents; ham, 15 cents; cheese, 20 cents.

**FOREIGN TARIFFS.****AUSTRALIA.****Trade Description for Condensed Skimmed Milk.**

By a regulation issued by the Governor General of the Commonwealth of Australia on February 28, 1912, a new paragraph is added to the provisional regulations under the commerce act, 1905 (see Tariff Series, No. 17B), providing as follows for the trade description of imported condensed skimmed milk:

In the case of condensed skimmed milk or condensed separated milk, the trade description shall include the words "Condensed skimmed milk, unfit for infants" or "Condensed separated milk, unfit for infants," printed in bold-faced sans serif type [i. e., gothic] of not less size than 12 points face measurement; the said words shall form the first words of the label; no other words shall be written on the same line or lines. Additionally, there shall be printed across the face of the whole of the label, in a diagonal line and in a transparent red color, the words "Skimmed milk" in bold-faced sans serif capital type of not less size than 48 points face measurement.

Under the old regulations a mere description of the character of the imported milk was considered a sufficient trade description.

**BRITISH HONDURAS.**

[From Consul W. L. Avery, Belize.]

**Increase in Export Duty on Mahogany.**

Beginning April 1, 1912, the export duty on mahogany and cedar was advanced from \$0.75 to \$1 per thousand feet.

**Increased License Fee for Commercial Travelers.**

On March 14, 1912, the Legislative Council of British Honduras increased the license fee payable by commercial travelers to \$50 from the date of issue up to and including the 31st day of December following. The former rate was \$10 per annum from the date of issue. There is a concession in the ordinance providing that if a license be issued after the 1st day of December in any year such license shall be in force for one calendar month from the day on which it is issued, so that if a commercial traveler should secure a license on December 30, for example, the license would be valid for the following 31 days.

**CANADA.**

[From Canada Gazette, Apr. 13, 1912.]

**Standards for Edible Vegetable Oils.**

Under the adulteration act the Canadian Government has established the standards for edible vegetable oil as follows: (1) Olive oil, sweet oil, is entirely a product of the olive tree; its specific gravity at 15.5° C. is not less than 0.914 nor more than 0.9196; its specific refractive index at 15.5° C. is not less than 1.47 nor more than 1.4718; its Maumene number lies between 42 and 52; its iodine absorption number (using the Hubl solution) lies between 77 per cent and 94 per cent; its saponification number (Koettstorfer number) lies between 185 and 195; it does not contain above 3.5 per cent of free fatty acids. (2) Cottonseed oil is the oil obtained from the seeds of cotton plants and subjected to refining processes; it is free from rancidity; its specific gravity at 15.5° C. is between 0.9216 and 0.93; its refractive

index (at 25° C.) is not less than 1.47 and not more than 1.4725; and its iodine number is not less than 104 and not more than 110 (Hubl solution).

Either of the above may be sold as salad oil, but when cottonseed oil is offered as salad oil, the fact that the article is cottonseed oil must be declared on the label. Mixtures of cottonseed oil with olive oil must be so declared on the label.

---

### CHOSEN (KOREA).

[From a published Reuter dispatch.]

#### Abolition of Export Duties.

The Japanese Foreign Government has decided, in spite of the representations of the British and French Governments [see Daily Consular and Trade Reports of Apr. 23, 1912], to abolish the export duties leviable on all except the following articles, exported from Chosen (Korea), namely, wheat, soya bean, beans, sesame, oxen, cowhide, coal, and iron. On the above articles the 5 per cent ad valorem import and export duties will be maintained.

The argument of the Japanese Foreign Office for the removal of the duties is that the declaration of 1910 [see Foreign Tariff Notes No. 1, p. 13] was to be understood as meaning only that the maximum amount of the existing duties would not be raised, but that under the Korean customs the Korean Government had always had the right to decrease or abolish the duties, which right was tacitly reserved to the Japanese Government at the time of the annexation. The right was not mentioned in the declaration, as the Japanese Government did not foresee that the right could ever be contested, the Japanese Government being the assignees by the treaty of annexation of the rights and privileges of the Korean Government.

---

### CUBA.

[From Gaceta Oficial, Cuba, Apr. 10, 1912.]

#### Special Reductions in Rates of Customs Duty.

The Cuban Government has granted exemptions from the surtax imposed in 1904 for a number of articles for use in the manufacture of pianos, at present dutiable under tariff No. 207. The articles included are specially prepared steel wire for pianos, from No. 12 to No. 22; specially prepared copper wire for pianos, from No. 1 to No. 27; keys for stretching piano strings; woods in sheets 1 centimeter thick, specially prepared for certain piano parts; apparatus and accessories, such as hammers, hammer catchers, and other small parts and pieces; maple wood specially prepared for bridges; piano keys of ivory and wood; bronzed cast-iron frames for fastening piano strings. Up to the present these articles have been dutiable under the general tariff at 52 per cent ad valorem, and under the United States preferential tariff at 36.4 per cent ad valorem; with the surtax removed in accordance with the present decree, the rates for the future are 40 per cent ad valorem under the general tariff and 28 per cent under the United States preferential tariff. These reduced rates are to be extended only to manufacturers of pianos, who shall

submit a sworn statement that the goods imported are to be used by them in the manufacture of pianos.

Special exemption from the surtax imposed in 1904 is also accorded for labeled tin containers, when imported by those engaged in the butter-making industry, for use as containers of butter. Such containers have been dutiable under tariff No. 56 at \$5.20 per 100 kilos, general rate, and at \$3.90 per 100 kilos, United States preferential rate. When imported as prescribed they will in the future be dutiable at \$4 under the general tariff and \$3 under the United States preferential.

---

#### DOMINICAN REPUBLIC.

[From Gaceta Oficial, Dominican Republic, Mar. 27, 1912.]

##### Changes in Consular Fees.

By a law of March 18, 1912, the tariff of consular fees in the Dominican Republic is slightly modified. The fee for the legalization of signatures and for certification is in the new law fixed at \$1, which is one-half the rate formerly in force. [A copy of the new tariff of consular fees, in Spanish, is on file in the Bureau of Manufactures.]

---

#### NORWAY.

[From Nachrichten für Handel, Industrie und Landwirtschaft, Mar. 8, 1912.]

##### Petition for Free Admission of Vegetables.

The association of hotel proprietors of Norway has petitioned the Government of the country to allow the free importation, or at least importation at greatly reduced rates of duty, of fresh vegetables during the months in which Norwegian vegetables are not to be obtained. The specific period of each year for which this exemption or reduction is sought is from November 1 to June 30.

---

#### SIERRA LEONE.

##### Revision of Duty on Spirits.

The Bureau of Manufactures is in receipt of a copy of a new ordinance revising the rates of customs duty on spirits imported into Sierra Leone, the documents having been transmitted by Consul W. J. Yerby.

---

#### UNION OF SOUTH AFRICA.

[From Commercial Intelligence, London, Apr. 8, 1912.]

##### Proposed Tariff Changes.

The South African Trade and Industries Commission, appointed to investigate industrial conditions and make suggestions for the furtherance of the industrial and commercial welfare of the Union, has submitted its report.

The commission appears to have been guided in the preparation of its report solely by the evidence obtained from witnesses and by the fiscal faith of its members, of whom a majority were protectionists. The result of their deliberations is, in the main, merely a collection of proposals in favor of higher import duties on specific articles, based on the proposals of the interested parties, supplemented by various recommendations in general terms for cheaper transport and for a more active policy on the part of the Government in the development of agriculture.

Among the proposals of the commission are recommendations that the rates of customs duty be increased on the following products:

Wheat, butter substitutes, chicory, confectionery, flour, macaroni, ham, bacon, mineral water, salt, and spirits; boots and shoes, crockery, tiles, leather manufactures, jewelry, and vehicles. The report does recommend reductions in the rates of duty on some articles, but these are of slight importance in comparison with the increases recommended.

---

#### URUGUAY.

[From Diario Oficial, Uruguay, Mar. 13, 1912.]

##### Proposed Tariff Revision.

The draft of a law has been laid before the Congress of Uruguay providing for the revision of the customs tariff, the bill in question containing a new schedule of duties for food products of all kinds. In this proposed law all the rates of duty are on a straight specific basis, instead of a percentage of a fixed valuation, as in the tariff at present in force. There are many other changes from the schedule which is now in effect, suggesting modifications in the customs classifications; for example, beverages are not contained in this draft, indicating that they may be included in a special separate schedule. This bill indicates a disposition to revise the tariff schedule by schedule.

It is proposed that the customs surtax of 5 per cent of the value of the goods shall not be collected in addition to the duties provided for in the schedule. The other surtaxes, amounting to about  $3\frac{1}{2}$  per cent of the value, will be levied on the value of the goods as declared in the customs.

On a number of articles it is proposed to reduce the rates of duty below those of the present tariff, but on many of the other articles, allowing for the change from the present basis of collection of duty and the abolition of the 5 per cent surtax, the rates under the proposed law amount to about the same as the present.

[Document transmitted by Consul Frederic W. Godding, Montevideo.]

In another bill it is proposed to make marked reductions of duty on a considerable number of raw materials and to authorize the President to grant exemption from duty on machines for use in industry. In the same proposed law there is a provision for the increase of the duty on cottonseed oil by about 5 cents a kilo.

---

#### WIRELESS TELEGRAPHY IN CENTRAL AMERICA.

[Translation from Nicaragua paper by Consul James W. Johnson, Corinto, Apr. 13.]

The National Electric Signal Co., of Pittsburgh, Pa., has corresponded directly with Minister Canton relative to establishing in Nicaragua, at their risk, several wireless stations. This company is the one which put in the stations of the United Fruit Co. and is now taking up the matter of establishing a number of others along the Atlantic coast of Mexico and Central America with the purpose of obtaining constant communication between these countries and the United States. The company also offers to put in at Managua a wireless tower of sufficient power to communicate with Salvador. It is probable that within a month the engineers will leave for Nicaragua to carry out the work.

---

German cotton "*sparterie*" trimmings were exported to the extent of \$13,980,000 in 1911, an increase of nearly \$1,000,000 over 1910. This does not include "embroidery on cotton, woollen, or linen foundation," exported to the value of \$7,340,000 last year, an increase of over \$500,000.

**GOOD RESULTS FROM TRADE-PAPER DISTRIBUTION.**

[From Consul Nathaniel B. Stewart, Durban, South Africa.]

All trade publications and newspapers forwarded to the Durban consulate are filed for a certain period in its reading room for general inspection and reference. As new issues arrive the old papers are neatly wrapped and delivered by messenger to representative firms about the city in the lines of business to which they pertain, and sometimes mailed to other points where it is thought that they may be of interest.

This practice began one and a half years ago, and while letters of thanks for the publications have been received from time to time and in a few instances inquiries made about certain ones if they failed to reach the parties accustomed to receive them, it was not known whether their distribution was accomplishing much toward advancing American trade. Recently, however, inquiries were made of some of the firms to which the papers have been sent, and it was learned that a number of articles have been introduced on the market here as a result of advertisements appearing in the publications. As examples, a leading haberdasher and a leading wholesale and retail grocer each showed to me several articles in their respective lines now carried by them which they learned of through advertisements in the trade papers from the consulate. Professional men, as engineers, the general manager of the local tramways, and others, also expressed appreciation of the publications sent them.

Since good results are being brought about through sending these out as stated, it is intended in the future to utilize very carefully all papers received. Business men of the city who are unable to take the time to visit the consulate will, during spare moments, look over papers sent them, and in this way it may be possible now and then to interest in American products some who might otherwise never have these wares brought to their attention. It is hoped, in view of the foregoing, that all trade publications now being sent to this consulate will continue to be forwarded and that many others not now received will be supplied by the publishers.

---

**BORROWING MONEY IN NORMANDY.**

[From Consul Charles Adam Holder, Rouen, France.]

American firms seeking to secure funds for loan on western farm mortgages are advised that this district is not a good one in which to borrow money. Local commerce and industries, such as cotton manufacturing and the importation of coal, lumber, and wines, require a good deal of money, and as Normandy is the most conservative district of France foreign loans make no appeal to investors. A few loans have been made in Algeria, where the returns net 8 or 10 per cent, but this is because local investors have many interests there and are doing a great deal to develop that colony. Attempts have been made to interest local financial institutions in American loans and commercial paper, but so far without success.

---

Firms who have received Confidential Circular No. 35, issued January 22, 1912, by the Bureau of Manufactures, are advised that Simpson & Co., of Dalny, Manchuria, are no longer in business in that city.

**AMERICAN SECURITIES IN SWITZERLAND.**

[From Consul General R. E. Mansfield, Zurich.]

The better feeling among Swiss investors in general in regard to American industrial shares and bonds has been apparent within the past year. A Zurich firm has issued an attractive Manual of American Railway and Industrial Securities. The character of the publication which contains maps of the territory covered by the different railways and detailed statements of the various companies whose securities are offered is evidence of the interest prevailing in Switzerland concerning American securities.

Swiss investors, who are as a rule very conservative, have been imposed upon in a great many instances, especially in the shares and bonds of new industrial concerns and mining companies, offered by clever promoters, which resulted in a prejudice against foreign securities in general and American securities in particular. But in the past few years the business has assumed a more conservative form, and investors now have an opportunity to obtain desirable securities through reliable local bankers and brokers, who offer to their customers every facility for investigation and obtaining reliable information concerning the properties back of the bonds and shares they are offering. The result has been a general improvement in the market, and a decided increase in the sale of the better class of American securities in Switzerland.

---

**MEXICAN INDUSTRIAL NOTES.**

[From the Mexican Herald.]

**Frontera Harbor Development.**

The Frontera port works, under the direction of Federico Gonzalez Garza, are steadily advancing; 350 feet of the provisional canal across the bar, which will admit ships of deep draft to the Usumacinta River, have been finished. Already 150,000 bunches of bananas are being shipped monthly.

**Cement Factory Absorption.**

The modern cement plant La Tolteca, near Tula, State of Hidalgo, has been purchased by the Associated Portland Cement Manufacturers of London. The installation of additional machinery at the works is now rapidly nearing completion, which will give the plant a daily capacity of some 250 tons, or, say, 1,500 barrels. The purchasing association controls almost the entire cement trade of England and has an annual productive capacity of some 2,500,000 tons of cement. Something less than one-half of this output is shipped to foreign markets. The concern is also building cement plants in British Columbia, South Africa, and other parts of the world.

---

**Real-Estate Loans in Prussia.**

Consul H. J. Dunlap, of Cologne, advises that it would be difficult to secure money in that part of Prussia for loan on American real estate, for the reason that money is in great demand for local building and improvement purposes. Loans on real estate there bring 5 to 6 per cent, and the security can be seen and its value estimated by sworn "taxators."

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8824. Electrical supplies.**—An American consular officer in a Mediterranean country reports that a firm in his district desires to be placed in communication with American manufacturers of the following articles for use in electrical work of all kinds: Mica, micanite, oiled cloth and cardboard for insulating purposes, insulating compounds, fusible wire for use in switches, ebonite and rubber insulating materials, carbons for arc lights, cable, and wire. The firm desires to represent manufacturers of the above and similar articles, is in a position to push the sale of them, and can furnish desirable references. Correspondence in English, French, or Italian.
- No. 8825. Machines for roasting and grinding coffee.**—An import and export agent in a European country, who states that he is in a position to furnish first-class references, advises an American consulate that he desires to purchase American machines for roasting and grinding coffee. He might also possibly become the exclusive sales agent in the country in which he is located for certain types and makes. Correspondence may be in English.
- No. 8826. Material for locking a river.**—A foreign Government is about to undertake the work of locking a river, and an American engineering expert will be engaged to supervise the arrangements. After a thorough investigation of the project this engineer will return to the United States, where the drawings will be executed and then sent abroad for the work to be undertaken. An American consul writes that there is every prospect of the work being commenced within the present year, and furnishes the name of a firm that is prepared to import such machinery and material as may be required in the undertaking. American manufacturers should lose no time in placing themselves in communication with this well-known firm.
- No. 8827. Cement.**—A report from an American consulate is to the effect that a resident of Australia is desirous of getting in touch with American manufacturers of cement which will resist considerable heat. Correspondence should be sent to this person as soon as possible.
- No. 8828. Bathtubs.**—An American consular officer reports that a firm in western Europe desires to import bathtubs of moderate price. This firm is anxious to receive from American manufacturers not only catalogues, but also price lists and other descriptive literature. Correspondence may be in English.
- No. 8829. Oak staves.**—A business firm in Portugal informs an American consular officer that it is interested in the importation of oak staves into that country directly from the United States. While some staves come by direct vessels owned by local merchants, by far the greater part of this business is done via England, the transactions being financed by English firms which realize good profits. If American firms would give credit important business might result. Credit of six months to a year would be necessary, as the goods would have to be sold gradually, in order to maintain prices. The firm in question would like to know the chief ports of shipment of oak staves for Europe and also to communicate with American houses interested in this proposition. Correspondence may be in English, German, or Portuguese.
- No. 8830. Flour.**—A report from an American consular officer in Italy states that a firm in his district desires to import American flour. It is said that references will be furnished by this firm. Correspondence should be in French or Italian.
- No. 8831. Representation in Germany.**—An American citizen, who is now located in Germany, is desirous of representing a good American firm in that country. This person enjoys a good reputation and would doubtless make a good representative for firms needing such an agent.
- No. 8832. Staves and pitch pine.**—A firm of merchants and shipowners in a European country has informed an American consular officer that it desires to correspond with firms in the United States exporting staves and pitch pine. Correspondence may be in English.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

**No. 646. Navy Department supplies.**—The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., will receive bids until June 4, 1912, for the following supplies. Firms interested therein should make application to the Bureau of Supplies and Accounts, giving the schedules desired by number: Schedule 4562, air hose; schedule 4557, galvanized plate steel, barge for torpedo testing purposes; schedule 4566, cheese cloth, rubber ferrules, air hose, running boat lights, oil meters; schedule 4576, traveling power hand cranes; schedule 4569, operating mechanical device, window and door frames, hardware; schedule 4574, lead silver facings, rubber hose, brass bolts and nuts, brass stud bolts, steel bolts and nuts; schedule 4563, furnishing and applying bituminous compositions; schedule 4571, wire galvanized steel netting, ebonite tubing; schedule 4565, hack-saw blades, iron tap bolts, boat chains, emery cloth, twist drills, mounted grind-stones, brass spur grommets, copper hammers and mauls, hardware, tools, combination locks and latches, wire steel nails, stencil cutting outfits, garnet paper, combination plow and blading planes, drawer pulls, iron pipe sets, machinists' sets, oil stones, flathead copper tacks, machinists' hand taps, taps and dies, pipe wrenches. Bids are invited until June 11, 1912, for the following articles: Schedule 4568, white ash, white hickory, maple, white plank oak, white oak, yellow pine, Oregon pine, redwood, Puget Sound pine spars, spruce, teak; schedule 4570, maple, North Carolina pine, poplar; schedule 4566, rolled naval brass, lead pipe for lining; schedule 4573, sheet brass, soft-rolled sheet copper, pig iron, brass pipe and copper tubing, seamless copper pipe, seamless condenser tubes, composition unions, composition angle valves, composition gate valves, safety and check valves, pop valves; schedule 4571, manganese bronze, corrugated sheet steel, cast-steel flanges and tees, black iron pipe, iron pipe with flanges, wrought-steel pipe; schedule 4564, bar round iron, galvanized medium steel angles, medium steel angles, billet steel, steel blooms, black sheet steel, galvanized sheet steel; schedule 4572, medium steel forgings; schedule 4575, tinned bacon, tinned corned beef, tinned biscuit, cocoa, flour in export bags, tinned flour, tinned lard, macaroni, evaporated milk, mustard, tinned peas, pepper, pickles, tinned prunes, rice, salt, tinned tomatoes; schedule 4567, alcohol in barrels, drop black in oil, crystallized granular sodium carbonate, fireproof glue, chrome green in oil, interior varnish; schedule 4574, graphite lubricating grease. Tenders will be received until June 18, 1912, for the following: Schedule 4578, gas-producing apparatus; schedule 4579, electric spot welding machine.

**No. 647. Furniture, floor coverings, fuel, and ice.**—Sealed proposals for furnishing articles covered by class 9, furniture and floor coverings, and class 14, fuel and ice, for executive departments and independent establishments, will be received at the office of the General Supply Committee, Union Building, Washington, D. C., until June 4, 1912. Blank forms, etc., furnished upon application to the committee.

**No. 648. White-oak and hickory lumber.**—Sealed proposals, in duplicate, will be received at the Rock Island Arsenal, Rock Island, Ill., until May 23, 1912, for furnishing and delivering at the arsenal quantities of white-oak and hickory lumber. Specifications and full particulars can be obtained by interested persons upon application to the commanding officer of the arsenal.

**No. 649. Equipments for wireless telegraph stations.**—Sealed proposals, in duplicate, will be received at the office of the Chief Signal Officer, War Department, Washington, D. C., until May 25, 1912, for furnishing the Signal Corps with four equipments, wireless station telegraph, to conform as far as possible to general specification No. 566, for installation in land stations. (Proposal No. 584.)

**No. 650. Concrete sidewalk.**—Sealed proposals will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 15, 1912, for concrete sidewalk on Burwell Avenue, Bremerton, Wash. Plans obtainable from the bureau or the navy yard, Puget Sound, Bremerton, Wash.

**No. 651. Steel lighters.**—Sealed proposals for the purchase of steel lighters will be received at the Isthmian Canal Commission, Washington, D. C., until July 3, 1912. (Circular No. 709.)

**CHILEAN NITRATE BUSINESS.**

(From Consul Alfred A. Winslow, Valparaiso.)

The nitrate industry starts out well for 1912, the production being greater for the first three months than ever before for a like period, with the exportations very heavy. During March the exports of nitrate amounted to 4,958,000 Spanish quintals (Spanish quintal = 101.4 pounds), against 2,538,700 quintals for 1911. During March, 1912, the United States took 954,100 quintals, against 598,900 quintals for the same month in 1911. The exports of nitrate for the first nine months of the nitrate year ending June 30, 1912, amounted to 45,116,926 quintals, against 40,819,705 quintals for the same time last year.

The consumption of nitrate in the world was very heavy in March, 1912, reaching 10,541,904 quintals, against 9,300,983 quintals for the same month of 1911. During the same time the United States, however, consumed only 515,750 quintals, against 772,875 quintals for 1911.

The price of nitrate was quoted at \$1.81 to \$1.83 United States gold per Spanish quintal for March, 1912, against \$1.66 to \$1.68 for March, 1911, and the nitrate people look for a very prosperous year. A strong selling propaganda is being pushed jointly by the Chilean Government and the producers.

The increased use of petroleum as fuel in the nitrate works will materially add to the profits, since it is claimed that fuel bills will be reduced 20 per cent, and these are important items in the nitrate business. There are now 12 nitrate works equipped for burning oil and several more installing fuel-burning plants.

---

**CONSULAR WORK IN RUSSIA.**

(From the London Times.)

The total number of paid consuls and vice consuls employed by the British Government in Russia is 14, viz, 1 consul general, 7 consuls, and 6 vice consuls. In addition to these there are several unpaid merchant consulships at the smaller ports and trade centers. The total staff of the British consulate at St. Petersburg consists of 4 individuals, whose combined annual salaries amount to £1,820 (\$8,857). At the German consulate general in the same city the number of the personnel (which includes 3 specially trained traveling commercial attachés) is 17, with salaries amounting to about £10,000 (\$48,665). In addition to the vast amount of work which such a staff can and does accomplish, the consulate general pays a fixed fee of 1 ruble (51.5 cents) to merchants for every letter containing information on commercial matters, a system which secures early information from all parts of the country.

---

**SOYA BEANS IN ARGENTINA.**

(From the Monthly Magazine of the Liverpool Chamber of Commerce.)

Experiments with soya beans in Argentina during the past three years having proved successful, leading estancia proprietors inform A. Grenville Turner, who selected the seed, that they intend to grow the crop on a commercial scale. The beans will be grown in preference to linseed, as a restorative crop, in rotation with wheat. As the percentage of oil in soya beans varies from 15.8 per cent to 23.2 per cent, inquiries are being instituted for seed beans having a high oil content, also for early and late varieties, to facilitate harvesting operations with other crops. The germinating capacities of soya beans vary considerably; all parcels of seed should, therefore, be carefully tested for germination before shipment.

# DAILY CONSULAR AND TRADE REPORTS

ISSUED BY THE BUREAU OF MANUFACTURES, DEPARTMENT OF COMMERCE AND LABOR

15th Year

Washington, Tuesday, May 21, 1912

## IMPROVED TRADE OF MANCHESTER.

[By Consul Church Howe.]

With the opening of 1911, it was expected that a further improvement in the Lancashire cotton trade would follow that experienced during the closing months of 1910. The spinning trade was troubled generally during the first half of the year by the dearth of raw material, but a substantial decline in the second half improved the situation and the spinners were able to dispose of an increased production at profitable rates. Spinners of American cotton are reported to have obtained good margins on the staple counts and manufacturers were well engaged. While dividends have been few, the losses sustained were less serious than in 1910 and larger profits were shown by the more favorably circumstanced companies.

### Conditions in the Textile Towns.

The spinning industry in the Accrington district, which is chiefly confined to American yarns, was handicapped in the earlier part of the year by the scarcity of cotton. Full time was worked in both the spinning mills and the weaving sheds and wages were good. The 16,000 looms in this district are almost entirely taken up with the manufacture of plain cloths. Active measures were taken by the local labor union to secure more members, and 1,800 new members were added, bringing the membership of the Accrington association up to 6,000.

In Bolton, as in most of the Lancashire spinning and weaving centers, the trade was seriously affected by the labor troubles during July and August. A number of small disputes took place in the spinning trade. In the card-room section trade was as bad during the first seven months of the year as during the two preceding years, but after that there was some improvement. The indications point to better trade, but the card-room workers have not yet felt the benefit of the improvement in the spinning trade. During the past two years the employers have been speeding up somewhat, so that the card rooms can supply more than the spinning rooms require,

especially when the latter are largely engaged on fine counts. An improvement in the spinning of coarse counts would mean better trade in the card room.

With the simultaneous increase in the demand for cloth from nearly all markets, both in England and abroad, the looms in the Burnley district were fully occupied throughout 1911. India is a most important and steadily increasing market for Burnley goods, as the printed goods made here seem to be suitable to the Indian climate and their low prices meet the demands of the poorer classes.

In spite of losses reported throughout the first half of 1911, the cotton trade of Bury and its surrounding district was more prosperous than that for a few years previous. The Bury manufacturers cater largely to the Far Eastern markets, and it is said that the difficulties in China and Persia have had more effect here than in any other Lancashire town of the same size. There were few mill extensions made during the year. No organized short time was worked, but in several cases manufacturers found some difficulty in running all their machinery full time, owing to a shortage of weavers. Weavers in the fustian trade received a readjustment of wages amounting to an increase, and the year closed with a grant of an increase in wages to loom jobbers in certain heavy-weight goods.

#### **Revival in Weaving Trade of Blackburn.**

There are some 80,000 looms at work in Blackburn, and the weaving trade in 1911 experienced a welcome revival from the period of depression extending back to 1907. All branches shared in the general improvement. The year opened with practically every loom running full time, but cotton and yarn were dear, and while there was a fair booking of orders, there was little or no margin. The demand increased as the year advanced and the high prices were no obstacle to business. Although prices eased when the favorable estimates of the new cotton crop were confirmed, the cheaper cloth could not overtake the shipments to foreign markets, where the goods passed quickly into consumption.

Besides the assurance of a good cotton crop, an important factor in the improving trade was the excellent economic condition prevailing in India, Blackburn's chief market for cloth, as a result of two good harvests. This steadied buying, and with a satisfactory demand from China and other large Eastern markets, orders were booked well ahead, although prices did not become satisfactory until early autumn. It is regarded as a strong indication of continued good business that there was no accumulation of stocks in India, China, or any other great market for Lancashire piece goods. Some difficulty was experienced during the year owing to the shortage of weavers, caused mainly by the emigration of operatives to Canada and the United States during the periods of depression in the home trade.

#### **Fair Year for the Oldham Spinners.**

In Oldham the year opened with brighter prospects than had existed since the boom period, although these were somewhat marred by the high prices of cotton. Profits began to decrease again in April, when the advisability of resuming short time was considered by the Federation of Master Cotton Spinners. The proposal failed to receive the required majority, but the recommendation to stop for a full week at Whitsuntide, June 5 to 10, was generally carried out.

While the period from the end of June to the middle of September was the worst of the year for the spinning companies, they took orders for delivery in the new crop period, on the basis of lower prices of cotton expected from the reports of the new crop. Their anticipations were in the main realized, for there was a drop of over 4 cents a pound in the price of cotton between September and October. The lower price stimulated a healthy demand in the trade and the spinners were able to obtain a price which left a fair margin of profit. The prospects of improved trade induced many new mills which were either empty of machinery or only partly equipped to complete their equipment and at least 300,000 new spindles were put in operation in the Oldham district.

The trade was interfered with by the labor troubles among the transport workers and a stoppage of mills took place, owing to the interruption in the supplies of cotton and coal. This stoppage occurred at a time when the trade was working at little or no profit and the effect was not so disadvantageous as it would otherwise have been.

The local velvet trade was also good during 1911. The Oldham weavers obtained an advance in wages in the middle of the year and an agreement was reached giving an increase of 5 per cent on all wefts of 40s and below and  $2\frac{1}{2}$  per cent on wefts above 40s, while other details in the official list were altered to the advantage of the operatives.

#### **Yarn Companies Show Profit—Preston District.**

The certified accounts of 100 limited liability companies producing yarn in Oldham, which operate a total of 8,623,180 spindles and have a share capital of \$18,142,594, show a net trading profit of \$145,080, which is equal to \$3.65 per \$486.65 (£100) for 1911, against a loss of \$50.52 per \$486.65 in 1910. With the help of reserve funds, an average dividend of \$4.35 per \$486.65 was declared, which is 1 per cent less than that paid in the preceding year. The mortgage and other loans of these companies amount to \$12,601,660, bringing the combined share and loan capital of these companies up to \$30,744,254. Assuming the average interest paid at 4 per cent and that this was not charged to trade, the profit earned on the whole capital in 1911 would have been \$644,275. This is equal to a profit of \$10.26 per \$486.65, against a loss of \$22.50 in 1910. The reserve funds and credit balances fell during the year from \$1,902,295 to \$1,030,218.

In the Preston district the cotton trade was steady. There are about 85 mills in the immediate vicinity of this city, containing 2,184,268 spindles and 65,111 looms. Plain and fancy goods, especially shirtings, are manufactured extensively here. While employment was good, the operatives' officials report that 1911 was a bad year as far as poor material was concerned, as a result of which the wages of the weavers were largely affected. The complaints of bad material were not confined to any particular counts.

#### **Raw Cotton Prices—Trade Associations.**

The lowest price of middling American cotton during 1911 was 9.84 cents and the highest 16.84 cents. The lowest for fully good fair Egyptian cotton was 17.75 cents and the highest 22.125 cents.

Being situated in the heart of the Lancashire cotton-spinning district, having 45 per cent of the spindles of that district within a radius of 8 miles, Manchester possesses great advantages as a distributing center for raw cotton. The interests of the spinners who

import cotton directly to this port are safeguarded by the Manchester Cotton Association, which is made up of cotton merchants, brokers, and many spinners. At present the spinning members represent 20,000,000 spindles. The association's board consists of 21 directors, representing leading Lancashire cotton firms, and there are 9 committees which carry on the work of the association. The direct importation of cotton at Manchester has increased from 32,059 bales of American and 34,202 bales of Egyptian in 1894-95, the first year after the opening of the Manchester Ship Canal, to 489,727 bales of American and 219,566 bales of Egyptian in 1910-11.

In April the affiliation of the Yorkshire Master Cotton Spinners' Association with the Federation of Master Cotton Spinners' Associations increased the number of spindles controlled by the federation by nearly 1,000,000. The international federation estimated the number of spinning spindles in the world on August 1, 1911, at 137,278,752, compared with 133,384,794 in 1910. Those in Great Britain increased from 53,397,466 in 1910 to 54,522,554 in 1911. In Japan the number increased from 1,948,000 to 2,131,494; in Germany from 10,200,000 to 10,480,090; and in the United States from 28,349,000 to 28,872,000.

#### Textile Machinery Exports—Velveteen Trade—Bank Clearings.

The exports of textile machinery from the United Kingdom decreased from \$37,054,518 in 1910 to \$32,992,173 in 1911, the trade being divided by countries as shown in the following table:

Country.	1910	1911	Country.	1910	1911
United States.....	\$5,559,884	\$2,304,950	Japan.....	\$1,763,153	\$1,708,466
Russia.....	4,266,256	5,545,210	South America.....	1,969,365	2,188,504
Germany.....	4,233,821	4,458,892	British East Indies.....	5,969,192	4,826,234
Netherlands.....	731,995	911,919	Australia.....	241,364	267,131
France.....	4,016,819	3,678,490	Other countries.....	7,597,739	6,955,823
China, including Hong-kong.....	685,130	156,818	Total.....	37,054,518	32,992,173

The velveteen trade in Manchester experienced the greatest boom in its history during 1911. The shipments to the United States began with a demand for velvet uppers for shoes, followed by a call for velvets for all classes of millinery and ladies' gowns. The total shipments of cotton velvets, cords, and fustians to the United States amounted to 6,233,449 yards, valued at \$1,608,668, in 1911, as against 3,113,038 yards, valued at \$832,860, in 1910. The velvet season for shipments to the United States begins in May and ends in October. All orders for delivery in 1912 are already booked and heavy shipments to the United States are contemplated during July, August, and September.

The report of the Association of Manchester Clearing Bankers shows that the checks and drafts passing through the clearing house during 1911 amounted to \$1,635,923,856, an increase of \$137,492,616 over 1910.

#### Hat Trade Prosperous—Increased Canal Traffic.

All branches of the hat trade were prosperous during 1911 and the exports from the United Kingdom showed an advance over the preceding year. The exports of hats from the Manchester district to the United States increased from \$194,794 in 1910 to \$201,621 in

1911. Canada takes large quantities of hats manufactured in this district and good orders from that country were reported. In addition to the increasing foreign sale, the home demand for stiff hats was satisfactory. The local trade in hat leather was steady during the year.

In spite of the disorganization and congestion resulting from the strike of the seamen, dockers, and carters, which began in July, the total traffic handled on the Manchester Ship Canal during 1911 amounted to 5,217,812 long tons, paying a revenue of \$2,826,662, as compared with 4,937,631 long tons, paying a revenue of \$2,704,484 in 1910. The imports of cotton, grain, foodstuffs, oil, manufactured iron, and unclassified goods and the exports of textiles, machinery, and salt were greater than those of 1910, while the imports of timber decreased. The Board of Trade report for 1910 shows that Manchester took fourth place among English ports in the amount of imports and exports handled. The total imports from foreign ports to Manchester, including Ellesmere Port, Runcorn, Warrington, and Partington, were valued at \$145,727,342, and the exports at \$85,110,218 in 1910, a total increase of \$19,466,000 over 1909.

An increasing proportion of the traffic at the Manchester docks continues to be forwarded or received for export by railway. The Ship Canal Co. is a railroad company and performs all the terminal work, such as loading and unloading, and hauls the cars with its own locomotives to and from the main line junctions with the dock railways. This company quotes through rates for the convenience of traders inclusive of canal charges and railroad conveyance to and from all parts of the country.

#### **Manchester as a Grain Port.**

During the last few years Manchester has made rapid strides in the flour-mill industry, and at present several new mills are being erected, one of which will consume about 50,000 tons of grain a year. Within a radius of 10 miles from Manchester there is a population of over 2,000,000, and the imports of grain have increased from 15,000 long tons in 1894 to approximately 493,000 long tons in 1911, of which some 117,106 tons were received from the United States and Canada.

The grain elevator at the Manchester docks was the first in this country to be constructed purely on the American principle, and it practically differs from the American elevators only in the arrangements for delivering the grain. In England grain is still delivered to the millers chiefly in bags.

This elevator has a capacity of 40,000 long tons, or 1,500,000 bushels, of grain. It contains 226 bins, varying in capacity from 37 to 300 tons, constructed of wood, in such a way as to keep the grain in the best possible condition.

The facilities for discharging grain from steamers into the elevator consist of a marine leg at the water side with revolving buckets, which has a capacity of 350 tons per hour. In order to accelerate the discharging of grain in parcels or from the smaller holds of a vessel, the canal authorities have recently supplemented the discharging apparatus by constructing eight pneumatic pipes, which suck the grain into the marine tower at the rate of about 25 tons per pipe per hour. These pipes work simultaneously with the marine leg.

The rates charged against the steamer for discharging grain cargoes are reasonable, and combined with the quick dispatch given every inducement is offered to the owners of vessels to discharge the cargoes at Manchester.

#### **Grain-Delivery Facilities.**

The grain is weighed and the weight recorded by both the owners of the grain and the representatives of the vessel. The appliances for delivery are so arranged that grain can be sacked, weighed, and loaded into 40 freight cars, 10 horse wagons, and 2 barges simultaneously. As the delivery of grain in bulk to freight cars is much quicker and cheaper than shipment in bags, the millers of some parts of Lancashire appear to be seriously considering making the slight alterations in their mills necessary to permit them to take the delivery of grain in bulk. The conveyance of grain in hopper cars over the various railroad systems will doubtless have to be seriously considered in the near future. Wheat from Karachi is invariably delivered in the original bags, which are unloaded at one of the large transit sheds at Manchester where there are facilities for redelivery.

The canal authorities have also acquired several floating grain elevators, which are used to accelerate the unloading of liners from the North American ports. These elevators discharge the grain over one side of the ship into barges while the general cargo is being taken over the other side to the quay transit sheds. The loaded barges are then towed to the main elevator and the grain stored there.

#### **Trafford Park Manufacturing District Growing.**

More than 80 firms have already established themselves on the Trafford Park estate, which adjoins the Manchester Ship Canal. A special arrangement puts all the factories in Trafford Park within 12 cents per ton of all the steamers which operate frequently and regularly to and from the port of Manchester. The firms established here include the British Westinghouse Electric & Manufacturing Co. (Ltd.), the American Car & Foundry Co., the Ford Motor Co., and the Dahlstrom Metallic Door Co. of America.

The Southern Cotton Oil Co. of Great Britain, whose parent company has 280 cottonseed-oil works in the United States, opened a plant at Liverpool during 1911, and is now erecting extensive works in Trafford Park to turn out 2,000,000 pounds of lard a week. The British Reinforced Concrete Co. (Ltd.), operating under the Clinton patents, are building works in the same place for the manufacture of wire cloth for reenforcement, fencing, etc. The Annex (Ltd.), a company with a strong financial backing, is also building a large plant at Trafford Park for the manufacture of corn products, consuming 50,000 tons of corn a year. This park is rapidly becoming the home of many modern flour mills. The English Textilose Manufacturing Co. will soon commence the manufacture of cloth from paper materials by the Clavier process, at their new works in this district, and another company is building an extensive whisky bottling and distributing agency nearby. A small factory in this region has been rented by a Liverpool firm for the manufacture of motor accessories.

#### **Ocean Steamship Service.**

The loading of the two twin-screw steamers *Argyllshire* and *Shropshire* at Manchester for Australian ports was a feature of some importance in the Australian and New Zealand trade. These ships are each

547 feet long over all, with a beam of 61 feet 4 inches, and are the largest that have navigated the Manchester Ship Canal. The sailings to Bombay increased during 1911, 49 Conference steamers having loaded at Manchester.

The weekly service between Manchester and Canadian ports was continued throughout the year, communication being provided with Quebec and Montreal during the summer and with St. John and Halifax when the St. Lawrence River is frozen. Manchester is one of the principal ports for the importation of wood pulp, owing to its proximity to the Lancashire paper mills, and this forms the bulk of the cargoes carried by the various steamship lines from Norway and Sweden. Shipments are also made from Montreal, Quebec, Chicoutimi, and Newfoundland. Manchester imports over 130,000 tons of wood pulp annually, and this material is said to have displaced esparto grass in the making of paper.

The imports of bananas into Manchester amounted to 2,501,237 bunches during 1911, this port being the chief point of entry in the United Kingdom for this trade. During 1912, however, the steamers in this trade will be transferred to Garston, where special accommodations for storing the fruit have been provided by one of the railroad companies.

Regular sailings from Manchester to Boston, Philadelphia, and New York are maintained throughout the year, and during the cotton season regular sailings are made direct to Manchester from Galveston, New Orleans, Savannah, Brunswick, and Charleston. A large alkali company on the banks of the ship canal regularly imports cargoes of phosphate rock from the Southern States, effecting a considerable saving in the cost of transportation, as the ships can discharge their cargoes directly into the works.

#### **American Motor Cars Make Steady Progress.**

The Manchester district is undoubtedly second only to London in facilities and opportunities for the sale of automobiles, and London authorities have described Manchester as the world's best center for the sale of commercial vehicles. The Manchester Motor Show is the most important trade exhibition held in England, with the exception of the one at Olympia, London. American manufacturers are making steady progress in this district and agencies have been established in Manchester for the Flanders, E. M. F., Mitchell, White, and Overland cars, of American make, while the Ford Co., of Detroit, has a factory here where the motor parts, shipped direct from the United States, are assembled and the finished automobiles turned out. This plant has a capacity of 3,000 to 4,000 cars per annum.

The hostility to the American car manifested by many British newspapers and journals dealing with motor matters has subsided to some extent, no doubt owing to the many satisfactory trials of American cars and the fact that the British public has come to recognize the American automobile as a machine that has taken a strong position in the trade in competition with English, French, German, and Italian manufacturers. A local paper, commenting on this growth, said:

America is only a few days distant from England, and with the best of American methods of obtaining publicity it does not take long for the merits of a car to be made known to the English public. So far there does not seem to be any settled plan of campaign against them by the English makers. For a long time it was the practice in England to book the order and build the car afterwards. In America the firms

build the car to create the demand. The public want a smart-looking, low-priced car that will stand rough wear.

The American machine is not the thoughtlessly designed, fragile-looking article that we have been led to believe. If the British maker does not immediately rise to the occasion, the British agent and the buying public will, and when it is too late the wholesale trade will be the American's.

#### American Breakfast Foods Imported—Exports to United States.

The importation of American breakfast cereals into this country continues on a great scale, and Manchester, owing to its geographical position, has become the principal center of distribution for the mid-land counties and northern England. During the past year approximately 200,000 cases were imported direct to Manchester, including "Quaker Oats," "Force," "Grape-nuts," "Hornby's Oats," "Molos-cuit," "Flaked Oats," "Shredded Wheat," "Triscuit," and "Flaked Maize." Present indications point to an increasing demand in Great Britain for cereal breakfast food.

The exports from Manchester to the United States, as invoiced at this consulate, dropped from \$16,306,990 in 1910 to \$15,613,941 in 1911. The exports by articles are shown in the following table:

Articles.	1910	1911	Articles.	1910	1911

The shipments to Porto Rico in 1911 were valued at \$11,802, a decrease of \$8,229 compared with the previous year. These exports consisted principally of linens valued at \$8,519, handkerchiefs \$1,013, and cotton piece goods \$978. The exports to Hawaii amounted to \$3,445, a gain of \$596, and consisted mainly of cotton and worsted goods and laces and nets.

**CONSTRUCTION WORK ABROAD.****CANADA.**

[From Consular Agent Sydney F. Culver, Fredericton, New Brunswick.]

**New Canadian Railway, Power Station, and Telephone Enterprises.**

The construction of the St. John & Quebec Railway began May 2, when two engineers left to commence work on the Fredericton and Woodstock branch. Clearing the right of way is progressing rapidly.

The hydroelectric station, which is to utilize the power of the Eel River and its tributaries in Carleton County, is to be constructed in a short time. When completed the station will be in position to supply cheap power to all the neighboring towns, including Fredericton. Letters of incorporation were secured in 1911.

A company capitalized at \$98,000 is applying for letters of incorporation to do business under the firm name of the Welsford & Hamstead Telephone Co. (Ltd.). It proposes to carry on a general telephone business in Queens County, with a head office in Welsford.

[From Monetary Times, Toronto.]

**Hydroelectric Power and Railway.**

Saskatoon has grown into a city of 18,000 in eight years, and is the distributing center for over 250 surrounding towns and villages. Saskatoon may be entered by rail from 9 different directions (before long from 14).

A charter has been granted to the Canadian agency, London, England, for constructing a river dam about 13 miles north of Saskatoon, the preliminary work upon which is proceeding. Altogether, the Canadian agency will spend \$2,000,000 during 1912 on this construction and in laying about 9 miles of street railway, which will be operating by September, 1912, a portion of the steel being down already. This is the first installment of a service which, within the next few years, will radiate in every direction throughout and adjacent to the city and will furnish electric power at low rates.

---

**CHILE.**

[From Consul Alfred A. Winslow, Valparaiso.]

**Railroad Construction.**

Railroad construction progressed very materially during 1911 on the 20 lines under construction for the Chilean Government, covering 1,580 miles, to cost \$56,580,331 United States gold when completed. At the close of the year rails were laid on about one-half of these new lines. Five of the lines are to be completed and opened for traffic during 1912. During the year 8,500 persons were employed on the several works.

Owing to a shortage of funds work is not to be pushed so hard on the Government railways during 1912. More is to be devoted to equipping the lines now constructed. It is estimated 240 engines and 2,500 cars will be needed within the next year to properly handle the increasing traffic of the country. An American manufacturer just secured an order for one hundred 20-ton steel freight cars, and it would seem American interests might be able to get more of this business. This can be done only through an agent here in Chile, who can keep in touch, study plans, etc., and submit bids, for the time given is entirely too short to do business by mail.

For the information of interested parties a list of firms in position to handle this business is forwarded [and may be had from the Bureau of Manufactures].

**Passenger Coaches to Be Built in Chile.**

The manager of the Chilean Government railways has been instructed to contract with Balfour, Lyon & Co., of Valparaiso, for 10 first-class coaches, at \$8,699 United States gold each, and 20 second-class coaches, at \$6,023 each. These are to be built according to specifications furnished by the Government similar to those supplied when bids are requested for foreign cars. This contract presents an opening for material, since most of the material needed must be imported.

---

**ROUMANIA.**

[From American Minister John B. Jackson, Bucharest.]

**Improvements in Many Cities.**

Before the adjournment of the Roumanian Parliament laws were passed to authorize several cities and towns (Curtea-de-Arges, Bacau, Botosani, Gorj, Tulcea, Cernavoda, and other places throughout the whole country) to contract loans, the proceeds of which are to be applied to the construction of schools and other buildings, to provide water supply, public fountains, sewers, electric lighting plants, etc., and to other purposes. Military casinos are to be constructed at Bucharest, Constantza, and elsewhere. The city of Bucharest has been authorized to contract a loan of \$6,000,000 (as noted in Daily Consular and Trade Reports for Apr. 20).

Much of the material and practically all of the fittings to be used in the contemplated construction work will be imported from abroad, and although the difficulties of transportation are considerable (especially in view of the existing situation at the entrance of the Dardanelles), it would be worth while for American manufacturers to pay some attention to the question of their supply.

---

**AUSTRIA.**

[From Ambassador R. C. Kerens, Vienna.]

**Electric Tram to Austrian Thermal Springs.**

The town of Hofgastein (Province of Salzburg) contemplates construction of a local 3-mile electric railway from the railroad station to the thermal springs and thence to Badgastein to connect with the thermal springs there. A survey has already been ordered.

---

**ENGLAND.**

[Prepared from London Times by Consul General John L. Griffiths, London.]

**Electrification of British Railways.**

Extensive plans for the electrification of the London suburban railway lines are under serious contemplation. These involve the substitution of electricity for steam on some hundreds of miles of railways in the London district, and it seems certain that the next few years will, for all practical purposes, see the end of the long reign of steam for traction purposes on the suburban routes serving the metropolis. The advantages of electrical operation for handling such traffic have been so completely demonstrated that the question has largely passed out of the technical into the financial phase. In some cases the terms on which the necessary capital for conversion could be raised are such as to induce railway boards to postpone the work of electrification until the latest possible date, and in no instance is the provision of the large funds for converting to electric working a large mileage quite a simple problem.

The railways which are considering the subject of the electrification of portions of their lines are the Great Eastern, the Midland, the Great Northern, and the Lancashire & Yorkshire Railways.

The plans for electrification of portions of the London & South Western Railway Co.'s lines, it is said, have now been settled and full details will shortly be announced.

With regard to matured plans for electrification of the schemes authorized, the East London conversion is making good progress, and on the London & North Western and North London Railways the placing of the contract for the work is only awaiting parliamentary sanctions of the bills. The new London & North Western local lines from Willesden to Watford, which as between Willesden and Harrow were to have been opened for traffic in May, will not in consequence of the delays arising from the coal strike be in operation until July, but the entire new route will be worked as a steam railway before the end of the year, and at a later date these lines, as well as the North London routes included in the scheme, will of course be electrically operated.

#### **Recovery of Traffic.**

The London, Brighton & South Coast Co. will probably remain alone in the London area as the adherent of the single-phase alternating-current system, which, whatever its advantages for main-line working, is not generally accepted as the ideal system for suburban traffic. That the conversion of the South London and Crystal Palace lines has had the effect of recovering traffic formerly lost to omnibus and tramway interests to a remarkable extent is common knowledge, but from the financial standpoint it is stated that the single-phase system is associated with high maintenance costs, and no figures have yet been published to refute the arguments of its critics. There is also the fact that the interference to telegraph and telephone circuits is far more serious with this system than with the direct current working, and it is known that action is now being taken by the post office against the London, Brighton & South Coast Railway on the ground of interference with the working of the lines carried on wayleaves over the Brighton system. This action should come on for hearing within the next few weeks.

An interesting development in connection with the battle of the systems is the decision of the Lancashire & Yorkshire Railway to work the Holcombe Brook branch on the high-tension direct-current system, and the results of this installation, the first of the kind to be employed in Great Britain, will be watched with great interest from the financial as well as from the merely operating standpoint. The advantages of electrical methods are from other points of view well recognized; it is on the financial side of operating and maintenance costs that statistics are now required.

---

#### **EGYPT.**

[From the Near East.]

#### **New Bonded Warehouses.**

The customs administration has granted to the Société Anonyme des Entrepôts et du Commerce the privilege, hitherto exclusively held by the Egyptian Bonded Warehouses Co. (Ltd.), of erecting sheds for the storage of goods within the customs boundary. The company has bought a piece of land on the quay, for \$80,000, on which to erect the sheds.

---

#### **CEYLON.**

[London Times correspondence from Colombo.]

#### **Colombe Harbor Works.**

On May 1 the governor laid the memorial stone of the new arms of the southwest breakwater completing the harbor works. The construction has been carried out after the designs of Coode, Son & Matthews, at a cost of \$15,000,000. It is proposed to construct, at a cost of \$5,000,000, a breakwater south of Galle, providing anchorage for 23 steamers, which would relieve Colombo.

---

#### **SOUTHERN NIGERIA.**

[From report of Comptroller of Customs at Lagos, West Africa.]

#### **Good Buildings Taking the Place of Huts—Motor Transport.**

Lagos, a town with nearly 80,000 inhabitants, constantly increasing in numbers, and with a rapidly expanding trade, affords an exceptional opening to a firm of British builders, with no very large capital, to work up an extensive business. The estimated expenditure by Government in 1912 on buildings in Lagos and its immediate vicinity amounts to some \$330,000. In addition to Government expenditure, with the increasing trade of the town and wealth of the people substantial buildings are taking the

place of the huts which formed the native portion of the town, and a large private business might be done with European merchants and private individuals.

The policy of developing Southern Nigeria by means of road making has resulted in the existence of several hundred miles of roads suitable for mechanical transport. Motor cars are used by several Europeans, and two native gentlemen in Lagos have recently acquired cars. In addition to Government transport services, the native government of Abeokuta has successfully arranged a small transport service employing six motor wagons. Several motor bicycles are used by natives. There is, however, a good opening for a motor transport service in Lagos in connection with the removal of trade goods from the warehouses to merchants' premises and to the railway, while much remains to be done to bring about a more general use of motor traction throughout the country.

### PHILIPPINE ISLANDS.

[From the Manila Free Press.]

#### Building of Sugar Centrals—Motors Evidence Prosperity.

The first modern sugar mill in the Philippines was formally opened in February on the hacienda of Señor Esteban de la Rama, in Talisay, Occidental Negros. It cost \$125,000. It is smaller than the sugar central now under construction at San Jose, Mindoro, but has a daily (12-hour) output of 14,000 pounds of 96° sugar, and will pay for itself in a few years. The central was built entirely by Filipinos, Señor de la Rama, aided by Señor Zoilo Diaz, electrical engineer, directing the work. Señor de la Rama is taking steps to construct another central with thrice the capacity at Bago, where another small central belonging to Urquijo y Compania is nearing completion.

A noteworthy feature incident to the ceremonies of inaugurating the new central was the large number of automobiles present. There were no fewer than 30, owned by hacendados who rode in for the occasion. Nothing could better testify to the prosperity that now reigns in Negros.

#### New Club Building—Bridges and Roads.

A \$50,000 Army club will soon be erected at Baguio, near the site of the Baguio Country Club. The building will be of reinforced concrete, and it is said that it will be the finest club in any Army post of the Philippines.

Of the \$2,250,000 made available for public works in the islands by the gold-standard fund [as noted in Daily Consular and Trade Reports for May 2], \$800,000 has already been loaned, 23 provinces having benefited. Neuva Ecija leads off with a budget of \$90,000, Ilocos Sur is next with \$81,000, Pangasinan third with \$72,000, and Ambos Camarines fourth with \$50,000. The loans to the first three Provinces named will be used in constructing bridges, while Ambos Camarines will use its loan for road and bridge construction.

### DYNAMITE AND BLASTING MATERIALS FOR PANAMA.

[From announcement of Isthmian Canal Commission.]

It is estimated that only 3,986,500 pounds of dynamite will be required for the canal work during the year beginning July 1, 1912. Saltpeter dynamite is specified, but bids will be received on Trojan or similar dynamite that can meet the requirements of the work.

The amounts purchased in past years were as follows: In 1907, 5,087,000 pounds; 1908, 6,822,000 pounds; 1909, 8,270,000 pounds; 1910, 10,403,800 pounds; 1911, 9,501,850 pounds; 1912, 8,533,000 pounds. The comparatively small amount estimated for the forthcoming year is due to the approaching completion of the excavation work, care being taken to avoid an overstock.

The estimate for blasting materials is as follows: Blasting caps, number, 328,000; tape fuse, feet, 877,000; insulating tape, one-half pound rolls, 3,680; connecting wire, feet, 10,000; lead wire, feet, 555,300; electric fuses, feet, 627,100; triple tape fuse, feet, 36,000; blasting powder, pounds, 20,000; and lead wire, feet, 25,000.

**EUROPEAN STEEL COMBINATIONS.**

[From London Times dispatches.]

**Partial Renewal of German Union.**

The negotiations for the renewal of the German Steelworks Union were concluded at Dusseldorf on May 1 after an uninterrupted sitting of 19 hours. The agreement is only partial. It has been decided to renew for five years the control of production and sale of "A" products—half-finished iron products, railway material, and shaped iron. On the other hand, the agreement regarding "B" products—bar iron, rolled wire, plates, and tubes—has expired.

It is regarded as a success that the union for "A" products has been prolonged for a number of years instead of being renewed provisionally until a complete agreement could be reached. This settlement was purchased, however, by abandoning the union for "B" products. It is generally stated that there is not likely to be any reduction of prices of "B" products in the near future and that attempts will be made to form separate syndicates for the various "B" products.

**The Belgian Agreement.**

An agreement has been reached between all the Belgian steelworks for the renewal of the so-called "Comptoir des Aciéries Belges" controlling the home and export sale of steel joists and channels above 3 inches manufactured in Belgium.

The existing arrangements will expire on July next, and from that date for five years the Belgian syndicate will include the following firms: In the Liege district—Ougrée et Harlhay Company at Ougrée, John Cockerill at Seraing, Aciéries d'Angleur at Tilleur, and S. A. Athus-Grivegnée at Grivegnée; in the Hainault Province—the Providence works, the Sambre et Moselle works, Usines Métallurgiques du Hainault, Thy le Château Steelworks, the firm Boel at La Louvière, and finally the Clabecq rolling mills at Clabecq, near Brussels.

---

**WOOL PRODUCTION IN GERMAN AFRICA.**

[Reuter dispatch from Berlin.]

A telegram from Windhoek (German Southwest Africa) states that the Emperor William has purchased for \$23,000 the farms of Dickdorn and Kosof, in the district of Gibeon. The farms are to be devoted to raising of sheep for wool. Herr Emil von Koenen, the owner of the farm, will remain tenant.

The farms are about 32 miles north of Gibeon, adjoining the line of the north to south railway. His Majesty's object in purchasing them is doubtless not only to give practical proof of his interest and confidence in the colony, but also to give a fillip to the wool-growing industry in Southwest Africa, from which great things are hoped. Considerable sums have been invested in the industry, although hitherto exports have been small. In recent years the industry has suffered by ravages of sheep pox among the flocks. The Emperor's brother-in-law, Prince Adolf von Schaumburg-Lippe, is interested in the wool-sheep syndicate which owns large stretches of land in the colony devoted to breeding merino sheep.

---

**EDUCATIONAL PROGRESS IN PHILIPPINES.**

[From the Manila Free Press.]

As a part of the industrial program of the Bureau of Education a new school will be established in Manila soon, to be known as the school of household industries of women. A recent act of the legislature has set aside \$50,000 for this school, which will begin its work by giving instruction in embroidery and lace making.

The catalogue of the school of arts and trades, which was issued recently, shows that the school has an enrollment of more than 500 pupils, and that there are nine courses in iron and wood work. The quality of work has risen steadily in all departments during the past year. Plans for the new building are nearly complete and work is about to start.

The Director of Education has received word from the United States that 234 teachers have passed the civil-service examination and are eligible to appointment in the Philippine service. Of this number 78 passed the assistant examination. Twenty-five new teachers are already on their way to the islands.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8833. Hosiery.**—An American forwarding firm has written the Bureau of Manufactures that it has an inquiry from one of the largest hosiery firms in an European country for American hosiery. The foreign inquirer is willing to buy against cash in large quantities. It is said that he has investigated the market, prefers American goods, and feels confident that he could work up a large trade in this line of merchandise.
- No. 8834. Electrical apparatus and domestic appliances.**—An American consul in the United Kingdom has forwarded a copy of a letter received from a business firm in his district relative to the opportunity for American manufacturers of certain lines of goods to secure sales in that country. This firm states it is very much interested in electric heating and cooking, and all domestic appliances, also in all kinds of electric advertising articles which can be brought into the British market and sold with great success, providing that the article is of good quality and at competitive prices. The firm has representatives in Ireland, England, Scotland, and Wales, and believes there would be no difficulty in pushing all the above articles, provided certain conditions are met. Copy of the complete letter, giving further details, will be sent to interested firms by the Bureau of Manufactures.
- No. 8835. Cotton.**—A business man in France having connections with spinning mills in that country informs an American consulate that he is desirous of entering into direct relations with some large cotton grower or broker in the United States for the purpose of selling bale cotton, as he wishes to operate independently of European commission agents. He believes that he can dispose of 40,000 to 50,000 bales of cotton a year. He states that he has ample references and can correspond in English. The consul is of the opinion that this is an excellent opportunity and hopes that some satisfactory arrangement can be made for simplifying the direct importation of raw cotton into that district.
- No. 8836. Alcohol.**—The Bureau of Manufactures is in receipt of a communication from an American business firm stating that it has an inquiry from the Levant for alcohol. The firm would like to have prices f. o. b. Smyrna. Any manufacturer interested in this trade is requested to communicate with this firm as soon as possible, as there appears to be a chance to get a part of the business this year owing to the prices charged for European alcohol.
- No. 8837. Shoes.**—An American consular officer in Italy reports that a firm in his district desires to secure the exclusive agency in a certain city for some large American manufacturer of men's, women's, and children's shoes. This firm has two large stores, is already handling American shoes which it purchases through a general agent in another city, and is in a position to market a considerable quantity. Correspondence should be in French or Italian. References can be furnished.
- No. 8838. Cotton goods.**—An American business firm writes the Bureau of Manufactures that it has an inquiry from its agents in the Near East for cotton goods in short pieces, from 1 to 5 yards and from 5 to 10 yards. The communication states that the inquirers are in a position to dispose of any quantity. Firms interested in this proposition should correspond with the American house, quoting prices f. o. b. Smyrna.
- No. 8839. Cottonseed hard soap.**—An American consul in the United Kingdom reports that several firms in his district have expressed a desire to communicate with American manufacturers of cottonseed hard soap for scouring purposes, with a view to importing the same. Communications regarding this matter should be submitted to the consulate forwarding the report.
- No. 8840. Shoes.**—A communication received by the Bureau of Manufactures states that an American firm has been advised by its agent in Turkey of calls for American shoes and wishes to communicate with a firm which is manufacturing a cheap grade of shoes for export. Prices should be quoted f. o. b. city of destination, and these, together with other communications, should be sent to the American firm referred to.

- No. 8841. Steel rails, fishplates, and rail rests.**—The American minister to Roumania in a cablegram reports that he has been informed by the American consul at Belgrade, Servia, that the Servian railway authorities are in the market for more than 14,000 tons of steel rails, also fishplates and rail rests for early delivery at Danube ports. It is said that the authorities would welcome American competition, and that an order satisfactorily filled would lead to others in the near future.
- No. 8842. Road construction.**—A report from the American legation at Tangier, Morocco, relative to the first allotment of a road from Casablanca to Marrakesh (Morocco City), was accompanied by specifications, notice of the award, etc. The award of this contract will be made publicly at Tangier on June 20, 1912. The total length of the road will be 1,700 meters, and the cost is estimated at \$4,760, not including \$645 for inspection and other sundry expenses. The specifications, etc., referred to can be obtained upon application to the Bureau of Manufactures.
- No. 8843. Cotton goods.**—A commission merchant of good repute in a foreign country and at present representing two large British firms informs an American consulate that he desires to represent a reliable American manufacturer of cotton goods similar to samples which he furnished and which can be obtained from the Bureau of Manufactures. This merchant systematically covers a large territory by traveling salesmen, and he particularly desires samples, prices, terms, etc., on goods of the widths marked on the samples submitted. While prices, widths, and qualities may be expressed in American terms, the correspondence should be in Portuguese, Spanish, or French. If this condition can not be met, persons interested may communicate with the inquirer in English, and the correspondence will be translated at the consulate in question.
- No. 8844. Glass marmalade jars.**—An American consular officer in Canada telegraphs that a business man in his district desires quotations on 1 to 5 gross lots, 3 to 3½ ounce individual glass serving marmalade jars. These jars should not have screw top. If obtainable, the inquirer will need five gross monthly. Bank references are furnished, and correspondence is desired at once.
- No. 8845. Bread-making machinery.**—An American minister reports that a Government official in the country in which he is located would like to receive communications from American manufacturers of machines used in bread making, for mixing flour and making the paste, not baking, such as are used in the United States Army. It is stated that a considerable number of small machines of this nature will soon be purchased.
- No. 8846. Leather, shoes, hardwoods, tires, and furniture.**—A report from an American consul in a Latin-American country contains the information that a merchant from that country is now in the United States with orders for American goods amounting to \$150,000, covering the following lines: Leather for shoe and carriage manufacture, fine shoes, hardwoods, carriage and automobile tires, medium and light drawing and dining room furniture, brass bedsteads, novelties, etc. This person is an American who has had four years' experience in the country in question and is now in the United States to get in touch with American interests looking for business. His address can be obtained from the Bureau of Manufactures.
- No. 8847. Electrification of Melbourne railways.**—The Agent General for Victoria, Melbourne Place, Strand, W. C., London, England, will receive tenders until June 4, 1912, for the electrification of the Melbourne Suburban Railways. The work is divided into the following sections: (1) Alternative direct-current system: (a) Turboalternators and transformers; (b) substation equipment; (c) electrical equipment of coaches. (2) Single-phase alternating current system: (a) Turboalternators and transformers; (b) substation equipment; (c) electrical equipment of coaches. (3) Common to both alternatives: (a) Boilers and boiler-house equipment; (b) condensing plant.
- No. 8848. Freight locomotives.**—The American minister at Bucharest, Roumania, reports that the "Direction des Chemins de Fer Roumains," Bucharest, will receive bids until June 7, 1912, for 32 locomotives for freight trains. Bids for these locomotives will be received in two lots, to be delivered within 12 months.

---

*Six new monoplanes* have been ordered by the British War Office, which will probably be adaptable as hydro-aeroplanes.

**WAGES IN MANCHURIA.**

[From Consul Albert W. Postius, Dalny.]

In referring to conditions affecting Japanese artisans and laborers in Manchuria a Japanese economist states:

It is generally admitted that as the development of financial conditions tends to a decrease of the money rates of interest, the laboring wage synchronously receives an increase. In the Leased Territory (Dalny), however, this has not proved to be the case, a general decrease in the laboring wage being noted. The many minor speculative enterprises which appeared in the Leased Territory subsequent to the late war were in the main the chief factors contributing to the high average wage paid during the period of reconstruction.

**Downward Trend of the Last Five Years.**

This downward trend is shown in the following comparative table of average daily wages paid to Japanese and Chinese artisans and laborers in the Leased Territory during the years 1907-1911:

Trade.	1907		1908		1909		1910		1911	
	Japa- nese.	Chi- nese.	Japa- nese.	Chi- nese.	Japa- nese.	Chi- nese.	Japa- nese.	Chi- nese.	Japa- nese.	Chi- nese.
Blacksmith.....	\$1.25	\$0.60	\$0.75	\$0.40	\$0.75	\$0.40	\$1.00		\$0.70	\$0.37
Bricklayer.....	1.25	.40	.75	.35	.85	.40	1.00		.70	.17
Carpenter.....							1.00		.70	.30
Coolie.....		.20		.15		.15				.16
Dye worker.....	.60	.30	.70		.42				.29	
Farm laborer.....		.17		.17		.17				.15
Joiner.....					.80	.35	.90		.62	.35
Mat folder.....	1.50		.75		.70		1.00		.87	
Painter.....	1.25	.50	.60	.30	.90	.35	.75		.75	.35
Plasterer.....							1.00		.95	.37
Printer.....	.50	.20	.50	.25	.75	.25			.62	.22
Sailor.....	.90	.42	.80	.44	.50	.25	.60		.45	.35
Sawyer.....	1.25	.40	.80	.30	.80	.35	1.00		.57	.27
Steel laborer.....	.50	.20	.80	.10	.00	.27	.65		.57	.17
Stevadore.....	.75	.27	.00		.50	.25	.60			
Stone cutter.....							1.10		1.07	.50
Tailor.....	.75		1.00	.50	.90				.75	.35
Tinsmith.....	1.25	.40	.00	.40	.75	.30	.85		.00	.37

As will be noted from the figures, a gradual decrease in the laboring wage paid both Japanese and Chinese has been evidenced in recent years. Still, in comparison with the conditions obtaining in Japan and China, a much higher rate of wage will continue to be paid in the Leased Territory for some time to come.

**Japanese versus Chinese Labor.**

It will also be noted that the Chinese coolie labor experiences no competition whatever from the Japanese. The latter in every instance pursues an avocation a grade or two above the Chinese artisan or laborer, hence the marked disparity between the comparative wage paid, and the elimination from the field of the ordinary Japanese coolie.

To a student familiar with wage conditions in China and Japan, it is at once apparent that the artificial wage paid to the Japanese artisan and laborer in the Leased Territory is certain to show a still further decrease, and that a normal state is likely to prevail as soon as the agricultural wealth of the district is sufficiently developed to cause a corresponding decrease in the cost of living.

## COMMERCIAL REVIEW OF UNITED KINGDOM.

[By Consul General John L. Griffiths, London; supplementing preliminary report in Daily Consular and Trade Reports for Feb. 1 and 16, 1912.]

The prosperity in the trade and commerce of the United Kingdom which was so marked in 1910 continued throughout 1911, although the percentage of gain was naturally smaller, as the increase in the volume of British imports and exports in 1910 was unprecedented.

There was a gain in the imports for seven months of the year as compared with 1910, and a falling off in April, May, June, August, and December, while the exports showed a gain in all the months excepting July, August, and September, which were the three months when the labor troubles were most acute, especially those affecting the railways and steamship lines.

### Effect of Labor Troubles on Business.

Notwithstanding the satisfactory total of foreign trade in 1911, the year, and especially the second half of it, was one of great apprehension and anxiety in consequence of the grave labor disturbances which prevailed over large areas, affected great masses of workers, and temporarily disorganized several of the most important industries of the country. The closing days of the year witnessed the inauguration of the cotton strike, since temporarily adjusted at least, and the threat of a coal strike throughout the Kingdom. There was also a strike, fortunately of short duration, in the woolen industry. During July and August the men engaged in the transportation services of the United Kingdom were on strike, which was accompanied by violence and bloodshed in certain localities, causing serious loss to the manufacturers and to dealers in perishable fruits and produce and inconveniencing everybody through the scarcity of supplies and their excessive cost. There was a renewal of the railroad strike in Ireland, which lasted from September 15 to October 4, and in which the strikers were unsuccessful. Prior to the railway trouble the seamen were on strike at the various English ports, and early in July it extended to the carters and dockers. London was not affected until August 1, but by August 7 all the riverside workers and most of the carmen

joined the strikers. For a few days the food supply of London was at the lowest ebb. Settlement was effected August 11.

The hopeful signs of the year included the activity in shipbuilding, the satisfactory railway receipts, notwithstanding the labor complications which greatly reduced earnings, the improved conditions of the iron and steel and the motor-car and motor-cycle industries, and of the woolen and worsted industries for the first six months of the year, the amount of new capitalizations, and the absence of stringency in the money market, and to the decrease in unemployment.

#### Extending the Markets for Home Products—Foreign Trade.

Efforts to popularize British manufactures at home and abroad were even more aggressive in 1911 than in the previous year, and the result was the "all-British shopping week," the renewed demand for an imperial trade-mark, the endeavor to bring the chambers of commerce throughout the country into closer affiliation, and the establishment of schools for commercial travelers.

Although the foreign trade of some countries has increased in recent years more rapidly than that of the United Kingdom, still its commerce has so expanded that the aggregate in 1911 was \$1,620,955,063 more than in 1901. The following table shows the total value of the imports, exports, and reexports of the United Kingdom for the past six years:

Years.	Imports.	Exports.	Reexports.
1906.....	\$2,958,289,385	\$1,827,737,382	\$414,151,219
1907.....	3,143,292,672	2,073,299,731	447,436,182
1908.....	2,886,519,328	1,835,739,081	373,093,089
1909.....	3,042,342,740	1,841,383,564	444,630,984
1910.....	3,300,737,807	2,095,465,317	505,026,410
1911.....	3,311,941,224	2,210,765,591	490,890,768

There was an increase in the imports into the United Kingdom in 1911 over 1910 of \$10,116,865, and an increase in the exports of \$115,300,275, but the reexports were less in 1911 than in 1910 by \$5,135,642.

#### Review of Gains and Losses in Foodstuffs.

The principal items contributing to the increased imports were food and drink and tobacco, which showed a gain of \$32,374,820, and manufactured articles a gain of \$42,500,741. There was a falling off, however, in the imports of raw materials and articles mainly manufactured of \$64,000,000. Of the gain of \$32,374,820 in the imports of food, drink, and tobacco, \$25,578,017 is credited to food and drink, of which \$10,929,594 represented the gain in sugar. The receipts of refined sugar from Russia advanced 2,100,000 hundredweight over 1910 and from Germany 650,000 hundredweight, while 1,000,000 hundredweight less were received from France. [Whenever the ton is mentioned in this report it is the long ton of 2,240 pounds, and the hundredweight of 112 pounds.] The receipts of unrefined sugar from Germany were 3,694,400 hundredweight greater and from Java 1,100,000 hundredweight greater than for 1910, while those from Cuba fell off 1,800,000 hundredweight and from Haiti nearly 1,000,000 hundredweight. The imports of tea increased in quantity by 16,222,000 pounds and in value by \$8,180,586.

The imports of flour decreased in value by \$7,472,647, notwithstanding an increase in quantity of 1,000,000 hundredweight. The decline in the imports of wheat was 7,113,543 hundredweight and in value \$25,467,380. There was a noticeable falling off in the receipts of wheat from Russia of 10,835,000 hundredweight, with increases from India, the United States, and Roumania. The quantity of wheat meal and flour imported showed a gain against 1910, but a falling off in value of \$1,138,089. Barley imports increased by 6,222,620 hundredweight, Turkey sending nearly 2,000,000 hundredweight more than in 1910. The receipts of rice were lower by more than 1,000,000 hundredweight than in the previous year. There was an increase in the amount of fresh beef received of 357,000 hundredweight, but a decline of 69,000 hundredweight in fresh mutton. The value of the meat imports, including animals for food, increased \$4,176,090. Butter imports increased \$528,799 in value, but decreased 22,583 hundredweight in quantity. Cheese showed an increase of \$1,606,266 in value, but a falling off in quantity of 118,018 hundredweight. The imports of eggs increased in value by \$3,257,947 and in quantity by 713,758 great hundreds (great hundred = 120). There was an increase in the value of unmanufactured tobacco of \$2,846,114.

#### Status of Raw and Manufactured Goods Imported.

Under raw materials and articles mainly manufactured the import of iron ore declined by 674,031 tons in quantity and \$1,999,265 in value. Raw cotton fell off in value by \$2,707,691, while sheep's wool showed a decline in quantity of 2,327,093 pounds and in value of \$3,941,451. There was an increase of 4,236 tons in the imports of jute and \$6,452,473 in its value; a shrinkage of 8,321 tons in the receipts of flax, but an increase in value of \$668,175; a gain of 10,572 tons in hemp and \$757,865 in value. Rubber showed a gain of 29,108 hundredweight in the quantity imported, but an extraordinary falling off in value of \$37,780,284, which represented nearly a 30 per cent decline.

In articles wholly or mainly manufactured there was an advance in the value of imports of iron and steel aggregating \$10,015,242; of machinery, \$6,318,547; and of metal manufactures other than iron and steel, \$14,078,580. The higher price of tin accounted for an advance in value of more than \$7,299,750 in the foregoing items. Cotton yarns and textiles advanced in value \$1,971,772, while there was a decline in other textiles. The imports of hats and bonnets increased, but those of boots and shoes decreased. The imports of chemicals advanced in value by \$2,086,025 and motor cars and parts thereof by \$4,187,178.

#### Principal Exports and Reexports.

There was a general advance in the values of the exports of the produce and manufactures of the United Kingdom. Articles wholly or mainly manufactured accounted for 81.7 per cent of the total increase; food, drink, and tobacco for 12.4 per cent; miscellaneous and unclassified articles for 4.2 per cent; and raw materials for 1.7 per cent. Cotton goods accounted for \$69,092,241 of the increase in manufactured articles; machinery, \$8,302,361; chemicals, \$7,421,403; apparel, \$5,368,854; cutlery, etc., \$4,738,579; iron and steel, \$3,771,280; motor cars and parts thereof, \$2,823,495; earthen and

glass ware, \$1,761,133; railway carriages, etc., \$3,381,488, leather, etc., \$946,276; and paper, \$920,586.

The principal increase in the exports of food and drink was in fish, which advanced in value \$5,810,611, beer and ale, \$783,202, and spirits, \$1,529,062. The exports of coal, coke, and manufactured fuel showed a gain of 2,756,526 tons in quantity and \$3,085,337 in value; bunker coal decreased 261,546 tons.

A falling off in the reexports of foreign and colonial merchandise in 1911 as compared with 1910 was confined practically to raw materials, which declined in value by \$16,566,349, to which wool contributed \$7,254,443. The reexports of food, drink, and tobacco advanced in value by \$6,993,647, and articles wholly or mainly manufactured by \$4,945,975.

#### Trade by Countries.

The following table shows the total imports into the United Kingdom from foreign countries and British possessions and the exports of the produce and manufactures of the Kingdom to foreign countries and British possessions during 1910 and 1911:

Countries.	Imports from.		Exports to.	
	1910	1911	1910	1911
<b>FOREIGN.</b>				
United States and possessions.....	\$580,512,384	\$606,112,871	\$159,027,030	\$139,466,184

<sup>1</sup> Exclusive of the value of diamonds.<sup>2</sup> Not given.**Conditions in the Money Market.**

Only four times during 1911 was the bank rate changed, and it did not exceed 4 per cent at any time. During 1910, however, it changed nine times. The average bank rate in 1911 was  $3\frac{1}{2}$  per cent as compared with  $3\frac{1}{7}$  per cent for 1910. The year opened with the Bank of England's rate at  $4\frac{1}{2}$  per cent, at which it had been placed on November 30, 1910. It was reduced to 4 per cent on January 26, 1911, to  $3\frac{1}{2}$  per cent on February 16, and to 3 per cent on March 9, at which rate it remained until September 21, when it was increased to 4 per cent.

The deposit and current accounts of the leading banks which issue monthly balance sheets showed on December 31, 1911, a total of about \$2,457,582,500, which was an increase of about \$87,597,000 during the year. There were no important acquisitions or amalgamations in 1911. Two banks of some importance suspended payment during the year.

The stock of bullion of the Bank of England, which was \$152,593,974 on December 28, 1910, was \$157,859,527 on December 27, 1911. This gain of \$5,265,553 almost made up for the loss of \$6,195,054 which was sustained in 1910.

**Imports and Exports of Gold—Mint Output—Clearing-House Returns.**

The imports of gold into the United Kingdom during 1911 aggregated \$236,969,351, against \$278,957,513 in 1910, while the exports

amounted to \$195,157,516 compared with \$247,695,117. The net total received from the Transvaal was \$165,947,650, being the highest total ever received from that country. The price of bar gold remained at the statutory price of \$18.92 throughout the entire year, with the exception of a few days in January.

There were sovereigns and half sovereigns valued at \$161,240,909, against \$123,122,450 for 1910, issued at the royal mint, and \$11,436,275 against \$13,139,550 withdrawn. The silver coins issued last year were valued at \$10,788,526, against \$12,266,455, and those withdrawn amounted to \$2,827,937 and \$2,748,393, respectively.

The clearing-house returns, which were unusually high during 1910, decreased last year. The amounts cleared at the London Bankers' Clearing House were \$71,118,432,420, compared with \$71,337,356,789 for 1910. The large turnover in 1910 was due to "the heavy borrowings on treasury bills in consequence of the postponement of the budget of 1909-10, the unprecedented issue of new foreign loans, and the increased capital for commercial undertakings, together with the rubber boom."

#### Conditions of the Stock Market.

The new issues in 1911 amounted to \$1,167,002,759, against \$1,631,523,323 for 1910, of which \$313,202,587 represented public loans, against \$697,583,089 for the preceding year. The total number of public loans (State and municipal) in 1911 was 57, against 64 in 1910, of which 37 were for municipal purposes. The bill issues amounted to \$160,594,500 and \$325,768,376 for 1911 and 1910, respectively.

The noticeable features of the stock market in 1911 were the large number of Canadian undertakings which were successfully financed, the liquidation of many rubber companies and skating-rink properties, the absence of any special activity, so marked in 1910, in oil shares, and the greatly increased price of certain industrial stocks. It was, however, a much steadier, healthier, and more normal year than its predecessor.

#### The Shipbuilding Industry.

Notwithstanding the increase in wages and in the cost of material, and occasional labor troubles, the year 1911 was one of continuous and exceptional activity in the shipbuilding yards of the United Kingdom. The improvement in freight rates caused the building of a great number of cargo boats, and the feature of the year was the construction of moderate-sized vessels designed to carry both cargo and passengers or cargo alone.

Of the 1,478 vessels of 2,080,397 tons built in the United Kingdom last year for the merchant marine, 897 vessels of 1,221,948 tons represented the output of the English yards, 557 vessels of 671,624 tons the output of the Scotch yards, and 24 vessels of 186,825 tons the output of the Irish yards.

Of the tonnage added to the register of the United Kingdom in 1911 about 92½ per cent consisted of new vessels, practically all of which were built in the United Kingdom. The vessels which were bought from foreign countries represented 82,757 tons. There was a gross deduction from the register of 1,018,034 tons, to which sailing vessels contributed 163,551 tons and steam vessels 854,483 tons. A

little less than one-quarter of the steam tonnage, and nearly 26½ per cent of the sailing tonnage which was removed from the register was on account of loss, breaking up, dismantling, etc. The tonnage sold by British shipbuilders to foreign owners in 1911 aggregated 730,485 tons, of which Norway acquired 155,393 tons, Greece 108,385 tons, Japan 88,352 tons, Italy 79,114 tons, Germany 42,247 tons, Turkey 34,657 tons, Netherlands 33,180 tons, Sweden 32,373 tons, and France 30,732 tons. The vessels, as a rule, were not of recent construction.

#### **Vessels of Special Design Constructed and Other Shipping Particulars.**

A larger number than usual of vessels of special design were built in 1911. They included 24 steamers built on the longitudinal system of construction, with a total tonnage of 109,113 tons, including 3 for the Great Lakes of America, and 1 on the topside tank system; 6 vessels fitted for burning liquid oil; 5 steamers of the cantilever framing and topside tanks type; 1 steamer fitted with steam turbines; 2 steamers with a combination of turbines and reciprocating engines; and 1 steamer with engines worked from a suction-gas plant and with screw shaft connected by a hydraulic transformer.

During 1911 six warships were in course of construction at various British shipyards for foreign powers, with an aggregate displacement of 60,550 tons. There were launched for the British Navy 5 battle-ships, 1 battle cruiser, 3 protected cruisers, 2 unarmored cruisers, 26 destroyers, and 6 submarines. [Additional statistics on the output of British and foreign shipyards and other shipping information appeared in the Daily Consular and Trade Reports for Feb. 1 and Apr. 10, 1912.]

The number of steam vessels on the register of the United Kingdom at the close of last year was 12,244 of 17,743,737 gross tons, and 8,836 sailing vessels of 1,063,375 gross tons.

Of the 234,148 seamen (excluding fishermen) employed on British vessels for the year ended June 30, 1911, 163,303 were British, 43,004 Lascars, and 27,841 foreigners. The number of deaths by injury was 1,233, or 1 in 190, against 1,223, or 1 in 192, for the previous year. The deaths by injury on sailing vessels were 234, or 1 in 75, against 1 in 90 for the year 1909-10. The number of deaths by disease on both steam and sailing vessels was 1 in 341, against 1 in 260 for the previous year. Of the 217 fishermen who lost their lives, death was due in 193 cases to injury.

#### **Shipments and Output of Iron and Steel.**

The relation between the shipbuilding and the iron and steel industries is necessarily close, and the activity in the British shipyards in 1911 was reflected in the iron and steel trades. The exports of iron and steel from the United Kingdom in 1911 aggregated 4,519,109 tons, as compared with 4,588,009 tons in 1910 and 4,210,799 tons in 1909. There were large shipments of boiler plates to the Continent and South America, but the shipments of steel to Canada were not as large as were anticipated, because of the heavy purchases made by that country in the United States.

The total output of pig iron in the United Kingdom in 1911 is estimated as less than 9,500,000 tons. The output of the Scotch furnaces in 1911 was 1,401,799 tons, as compared with 1,414,461 tons in 1910; the Cumberland furnaces 946,687 tons, against 1,133,500

tons; and the Cleveland mines, which practically feed the furnaces of the northeast of England, 6,250,000 tons, as compared with 6,152,823 tons.

The following table shows the exports in quantities and values of iron and steel produced in the United Kingdom for 1910 and 1911:

Articles.	1910		1911	
	Tons.	Value.	Tons.	Value.
Pig iron.....	1,205,444	\$19,994,283	1,204,315	\$18,758,430
Railway material.....	607,537	18,191,580	493,876	16,517,565
Plates and sheets.....	847,474	47,305,319	885,248	49,589,344
Wrought tubes and fittings.....	168,002	12,261,922	178,478	12,148,262
Tin plates and sheets.....	482,981	31,851,260	464,355	33,308,699
Girders and joists.....	128,232	4,498,405	119,567	4,812,147
All other.....	1,148,339	75,035,010	1,188,270	76,287,882
Total.....	4,688,009	209,145,969	4,519,100	212,917,249

#### Liability of Steel to Oxidization.

One of the leading publications analyzing the iron and steel trade for 1911 said in part:

The belief in the greater liability to oxidization possessed by steel has been strengthened and seems to have taken hold of the minds of constructors. It may perhaps be doubted whether the movement will be of long duration, but it is very welcome to iron manufacturers who have felt that their branch of the industry was gradually slipping away from them. If it can be proved satisfactorily, for instance, that wrought-iron bolts are in less danger from rust than steel bolts there is no doubt that constructional engineers will use them almost exclusively, even at a slightly higher price, because the cost of the bolts and nuts in a piece of constructional engineering can not in any case be of serious moment. Wrought-iron bolts used with steel plates and angles may not prove so satisfactory as the same bolts used with iron plates and angles from the point of view of oxidization. The result of the greater appreciation of iron as a constructional material is to be seen in the improvement which has taken place in Lancashire bar-iron prices, while during the same period steel prices have not moved much.

There was a large business done in manufactured steel during 1911; in fact, it is generally stated by steel merchants that the volume of trade was greater than for some years, and the steel works were well supplied with orders throughout the year.

#### Limited Demands for Locomotives.

The depression in the locomotive trade, which was so marked in 1910, continued throughout last year. At the end of September there were 22,503 men employed in the industry as compared with 20,274 in 1910, 21,144 in 1909, 22,915 in 1908, and 24,450 in 1907. The locomotive trade depends far less on the home than it does on foreign markets. The demand from India, upon which trade the prosperity of the British locomotive industry is largely dependent, was not satisfactory during the year, orders for one to five locomotives being the rule.

The South American demands did not fulfill expectations, and to the small demands of both India and South America the depression of the year may be principally attributed. There was an increase in the colonial requirements, and it is believed that there will be a steady demand from this source for a long time to come. Only comparatively few orders were received from the Continent, and there was a limited demand from Japan and China. It is thought that within a short time, however, the Chinese market, in view of the railway developments that must take place in that country, will furnish a large outlet for British locomotive builders.

**Increased Shipments of Tin—Galvanized Iron.**

Although not many years ago the activity of the Welsh tin-plate industry depended in great measure upon the American demand, and that demand has become almost a negligible quantity, and there has been a great falling off in the exports to Canada, nevertheless the aggregate exports in 1911 were the largest in the history of the trade. It is realized that the competition is becoming keener each year. Many new mills were built in 1911, not only in England, but in other countries. Fortunately the demand kept pace with the increasing supply, but how long this will continue is, of course, problematical. The total exports of tinned plates and tinned sheets in 1911 from the United Kingdom aggregated 484,355 tons, valued at \$31,660,404, as compared with 482,972 tons, valued at \$25,416,556, in 1910. The increase was only 1,383 tons, but omitting Canada and the United States the increase to the remaining countries was 74,311 tons. The exports to the United States were only 13,997 tons in 1911 as compared with 73,619 tons in 1910, and to Canada 14,428 tons compared with 25,741 tons.

There were 525 tin-plate mills in the United Kingdom at the close of 1911 as compared with 450 at the close of the previous year. The average price of tin plate was about 12 cents per box more than in 1910. This was due, however, to the higher prices which prevailed in the earlier part of the year and which quickly declined. Tin plate sold at \$3.46 per box in January, in September at \$3.31 to \$3.28, and in November at \$3.22. The average price for tin throughout the year was \$184.92 per ton higher than in 1910, and with the slight advance in the wages paid to the tin-plate workers the profits of the industry were not exceptionally large.

The London Times commented on the trade in galvanized iron as follows:

The demand for galvanized iron continued good throughout the year and although it was feared at the commencement that the enlarged output might not be absorbed, the increasing requirements of the overseas markets proved equal to it and the total shipments showed an increase of 20,608 tons as compared with 1910. India was again the best customer and took 10 per cent more than in the previous year. The Australian colonies came second with an increase of 8 per cent, while the demands from Argentina fell off 20 per cent compared with the previous year. Prices did not show a great variation during the year and after receding \$3.64 per ton recovered to about the same extent, so that the quotations at the end of 1911 about equaled those at which the year began.

**The Copper Situation.**

It was not until the closing months of 1911 that any upward trend was shown in copper. This was due to a great reduction in the visible supply, both in America and Europe. On December 15, cash copper rose to \$299.89 a ton, making a net rise during the year of about \$26.76 per ton. The European visible supply, which on January 1, 1911, aggregated 83,797 tons, decreased by the middle of December to 56,569 tons. The combined visible supplies in Europe and America at the middle of December, 1911, was 106,473 tons as against 138,275 tons at the close of the preceding year. In addition to the foregoing supplies there were 13,400 tons in Hamburg and Rotterdam, the stocks in those cities having declined during the year by about 9,000 tons. The feature of the copper market in 1911 was that nearly every nation increased its imports from the United States. The greatest advance in the consumption of copper during 1911 was in

France, the increase being from 65,500 in 1910 to 80,800 tons in 1911; and in Germany from 117,200 tons to 135,500 tons. The consumption in the United Kingdom in 1911 was 97,200 tons, against 96,300 tons in 1910. The copper situation was more favorable at the end of 1911 than it had been at any time during the year.

#### **Increased Shipments and Output of Coal Notwithstanding Labor Conditions.**

Notwithstanding the feverish condition of labor in the mining districts of the United Kingdom, especially in the South Wales territory, during almost the whole of 1911 the British coal trade showed an improvement over 1910. The quantity of coal shipped abroad in cargoes aggregated 64,599,266 tons in 1911 as compared with 62,085,476 tons in 1910. The output of the coal mines in the United Kingdom for last year is estimated at 271,878,924 tons. [Statistics showing the shipments of coal by countries were published in the Daily Consular and Trade Reports for Feb. 1, 1912.]

The London Times, commenting on the coal situation, said:

One of the principal features of the year was the large orders received in consequence of the war between Italy and Turkey. Up to that time the exports were smaller than for several years. There was a noticeable gain in the shipments to France and Egypt, South America, and Russia. The prices of coal during the greater part of the year were steady and normal, but as the labor situation grew more intense prices advanced, and coal that sold in January at \$4.50 per ton commanded \$5.22 in December. The average rise in the price of Newcastle coals was 36 to 48 cents per ton and for Cardiff coals 18 to 30 cents per ton.

#### **Prices and Supplies of Cotton.**

The most significant feature of the cotton industry last year was the great decline in its price at the end compared with the beginning of the year. The highest quotation of middling American in January was 16.22 cents; in May, 16.84 cents; in September, 14.64 cents and in December, 10.22 cents.

The visible supplies of the different varieties of cotton on December 30, 1910 and 1911, respectively, were as follows: American, 4,198,790 and 4,690,970 bales; East Indian, 188,060 and 60,960 bales; Egyptian, 440,420 and 377,880 bales; and other cotton, 52,260 and 66,810 bales, making a total of 5,196,620 bales at the end of 1911, compared with 4,879,530 for the same period the preceding year.

The development of cotton growing in some of the British overseas possessions was marked during last year and shows the persistent attention paid to the possibilities of British-grown cotton in anticipation of the time when the shipments of cotton from the United States will be greatly reduced owing to the increased American consumption. The council of the British Cotton-Growing Association sent a deputation to Egypt last winter to inquire into the possibilities of extending the cultivation of cotton in the Anglo-Egyptian Sudan. The association is allowed an annual grant of \$48,665 from the British Government, and for eight years has been actively engaged in the establishment of new cotton-growing fields in different parts of the British Empire and more particularly in Uganda, which country has been steadily increasing its output, being 16,000 bales of 400 pounds each for 1911 against 10,000 for the preceding year. The output in the West Indies increased from 6,000 bales in 1910 to 7,000 bales in 1911. Nyasaland increased its output from 5,000 bales

to 6,000 bales, and the output in the Sudan, being the first statistics available, was 12,600 bales.

A large cotton acreage was purchased in Mississippi last year by the British Fine Spinners' Association, and it is thought that this may develop into a growing desire on the part of British spinners to acquire more of the sources of supply.

#### **The Egyptian Crop—The World's Spindles.**

Last year's Egyptian crop was larger than the average. The estimated total for 1911 was 6,500,000 cantars (cantar=99.05 pounds). Although this was less than the 1910-11 crop, which aggregated 7,573,537 cantars, it surpassed that of 1909-10 and approached nearly to the production of 1908-9.

The total number of cotton spindles in the world at the end of 1911 was estimated at 137,278,752, compared with 133,384,794 for the end of 1910. The number of spindles in the United Kingdom at the end of 1911 was 54,522,554; United States, 28,872,000; Germany, 10,480,090; Russia, 8,671,664; France, 7,300,000; India, 6,250,000; Austria, 4,563,745; Italy, 4,582,065; and Japan, 2,131,494.

#### **Large Increase in Exports of Cotton Piece Goods.**

Of the \$69,092,241 increase in the value of the exports of cotton goods last year compared with the previous one, piece goods represented a gain of \$57,559,263. There was an increase in the cotton piece goods exports from Great Britain in 1911 to China, Turkey, Germany, Switzerland, Madras, Bengal, Burma, Egypt, Venezuela, Bombay, Dutch East Indies, and Central America amounting to 755,000,000 yards. The exports, however, diminished to the Philippine Islands, Colombia and Panama, Belgium, France, Portugal, Argentina, British West Africa, British South Africa, Canada, Japan, and the United States to the extent of 90,000,000 yards, leaving the net increase of the year at 665,000,000 yards. India took 207,500,000 yards more in 1911 than in 1910, China 176,000,000 yards more, Turkey 63,000,000 yards more, and Egypt 40,000,000 yards more. The exports of cotton yarn increased in quantity in 1911 by 32,228,500 pounds and in value by \$11,324,145. [The shipments of British piece goods by countries during 1911 were published in the Daily Consular and Trade Reports for Feb. 1, 1912.]

#### **Prospects for Present Year.**

In its annual trade review of the cotton trade for 1911, the London Chamber of Commerce, regarding the prospects for 1912, stated:

The year 1912 began with spinners and manufacturers fairly deeply sold at profitable rates, and whatever may happen later on the first six months is bound to be a busy and profitable period. With matters more settled in China and the Near East, there is no reason to doubt but that British shipments in piece goods will make a further leap forward, as there was never a time when the prospects were so healthy in India. Manufacturers are in a strong enough position to hold for remunerative prices, and in weaving the outlook is healthy. There is a little uncertainty with regard to the future in spinning. Producers had a good time during the last months of 1911. A great deal depends upon the offtake in export descriptions, but the comparatively low prices in raw cotton should do much to help spinners maintain their position. The most favorable feature is that large supplies of American cotton will be available throughout the year at lower prices than for a long time past. The Egyptian crop may only be a moderate one, but should be about sufficient to meet the demands of users. On the whole, the year 1912 began under favorable conditions.

There was very little labor disturbance in the cotton trade of the United Kingdom until the close of 1911, when the weavers demanded that no one be employed who was not a member of the weavers' trade-union organization, and an increase in wages was demanded. December 27 a lockout was inaugurated which affected 160,000 cotton operatives. After the mills had remained closed for about three weeks the British Board of Trade intervened and a settlement for a time was effected.

Conditions in the woolen trade were favorable up to June, when a strike of three weeks' duration occurred in the wool-combing industry of Bradford. Political disturbances in Europe and China, the harvest failure in Russia, and other factors caused adverse influences. There was very little decline in the prices, however, and the year closed firm.

#### **Imports of Wool and the Trade in Woolen and Worsted Goods.**

There was an increase of 115,000 bales in the imports of Australasian and Cape wool as compared with 1910, bringing the total up to 2,898,000 bales. The increase in the home absorption over 1910 was 78,000 bales and in the Continental 110,000 bales, while the American demand fell off by 73,000 bales. It is stated that the manufacturers of worsted goods had, on the whole, a fairly good year. The feature of the year was the predominance of woollens over worsteds, for while the exports of woollens were the largest in the history of the trade, the quantity of worsted tissues exported was the lowest with the exception of 1908. The "hobble" skirt is held to have been accountable for a serious falling off in the consumption of dress goods, while the unusually hot and rainless summer caused a widespread use of thin fabrics. The exports to the United States from the Bradford district, the center of the woolen industry of Great Britain, were the lowest since 1903. In consequence of the small woolen imports into the United States in the past two years the stocks of all kinds of textiles in that country must be so reduced as to necessitate large orders in 1912.

#### **Decreased Imports but Increased Exports of Shoes.**

There was a falling off of 186,720 pairs and \$111,890 in value in the imports of all kinds of boots and shoes to the United Kingdom last year compared with the previous one, while the shipments out of the country increased 482,832 pairs and in value \$1,427,105. The total imports of boots and shoes made of leather last year were 169,617 dozen pairs valued at \$3,245,022, against 168,236 dozen pairs valued at \$3,278,434 for 1910. Shoes made principally of rubber were imported to the number of 119,253 dozen pairs valued at \$796,290, compared with 158,024 dozen pairs and a value of \$944,632 for 1910. The imports of shoes made of other material than leather or rubber amounted to 115,720 dozen pairs against 93,890 dozen pairs for 1910, and their values were \$385,704 and \$315,740, respectively. Statistics showing the country of origin of the footwear imported are not yet available.

The total exports during 1911 of boots and shoes manufactured in the United Kingdom and made principally of leather were 1,152,244 dozen pairs, made of rubber 153,508 dozen pairs, and made of other materials 120,663 dozen pairs, and their values were \$16,327,681,

\$772,503, and \$415,351, respectively. The following table shows the quantity and the values of boots and shoes made principally of leather exported from the United Kingdom during 1910 and 1911 and the principal country of destination:

Destination.	1910		1911	
	Quantity.	Value.	Quantity.	Value.
	<i>Doz. prs.</i>		<i>Doz. prs.</i>	
France.....	51,297	\$1,523,675	48,000	\$1,406,745
British South Africa.....	384,909	5,261,802	373,280	5,127,292
British East Indies.....	101,000	1,453,550	125,591	1,773,236
Australia.....	122,167	798,588	126,082	969,290
New Zealand.....	74,804	942,694	81,834	1,104,423
British West India Islands (including Bahamas) and British Guiana.....	45,458	401,345	43,605	399,495
Other countries.....	307,003	4,358,315	253,862	5,455,200
Total.....	1,066,638	14,744,900	1,152,244	16,827,681

Since 1904, with the exception of the poor trade year of 1908, there has been a decided advance in the export of boots and shoes manufactured in the United Kingdom. The excess of exports over imports in 1904 was slightly under 6,000,000 pairs, while in 1911 there was an excess of nearly 11,000,000 pairs.

The exports of boots and shoes of foreign and colonial manufacture in 1911 aggregated 461,328 pairs valued at \$381,227, compared with 407,484 pairs valued at \$306,200 the previous year.

#### The Leather and Hide Trade.

There was an improvement in the leather industry of the United Kingdom in 1911, but it was confined largely to the boot and shoe branch of the trade. The recovery was more marked in the latter part of the year than in the earlier months. With low stocks at the close of the year and increasing consumption, prospects for 1912 are regarded as excellent. The imports of undressed leather into the United Kingdom in 1911 aggregated in value \$26,475,434, against \$24,584,716 in 1910, while the reexports increased in value from \$6,156,069 to \$6,852,353, leaving a balance for home consumption in 1910 of the value of \$18,428,647, and in 1911 of the value of \$19,623,081. The largest imports each year were from British India and the United States, although the receipts from the United States fell off in value from \$7,968,188 in 1910 to \$7,865,402 last year.

The imports of dressed leather into the United Kingdom in 1910 were valued at \$22,278,077, and in 1911 at \$21,724,435. The reexports in 1910 amounted to \$2,900,940 and in 1911 to \$2,516,097, leaving a balance for home consumption in 1911 valued at \$19,208,337. The principal countries from which the imports came were Germany and the United States, but, as in the case of undressed leather, there was a decline in the receipts from the United States, the total for the two years being of the value of \$11,776,574 in 1910 and \$10,768,420 in 1911. The exports of British tanned, tawed, or dressed leather in 1911 amounted to \$14,051,385 in value.

Dry hides were imported into the United Kingdom in 1910 amounting to \$9,031,790 worth against \$8,051,896 in 1911, while the imports of wet hides in 1910 aggregated in value \$11,762,466 and in 1911 \$10,180,323. The exports of British raw hides and undressed skins

in 1911 were valued at \$2,894,803, of which \$648,777 were from imported cattle slaughtered in the United Kingdom, compared with \$2,686,410 in the previous year.

#### **The Rubber Market.**

The fluctuations in the price of rubber, although not as pronounced in 1911 as in the preceding year, were sufficient to give an erratic tone to the market. The highest price for plantation rubber reached in 1911 was \$1.95 per pound and the lowest \$1.09 per pound as against \$3.12 and \$1.25, respectively, in 1910. The variations in the price of hard Para rubber in 1911 were \$1.75 and 94 cents per pound, while in 1910 they were \$3.04 and \$1.33 per pound. The world's production of rubber in 1911 is estimated at 85,000 tons, or 5,000 tons in excess of 1910. The increase was wholly in plantation rubber, as there was a small decline in the output of hard Para.

The imports of rubber into Great Britain in 1911 amounted to 45,300 tons, against 43,850 tons in 1910 and 35,000 tons in 1909. There were 28,480 tons reported in 1911, compared with 23,390 tons in 1910 and 19,890 tons in 1909. The stocks of rubber in the United Kingdom at the end of 1910 were placed at 5,200 tons, while at the close of 1911 they were estimated at only 4,300 tons.

There was a large increase in the amount of rubber offered for sale at the auctions in London last year compared with previous years. The London Times remarked that "this increase in auction business is gratifying, as it helps to eliminate much of the speculative element and to give more stability within reasonable limits to price."

As increasing production is being accompanied by a growing demand since new uses are being constantly found for rubber and with the disappearance of the speculative influences which were so pronounced in 1910, it is thought that fairly steady prices will be maintained for some time to come and that there is little danger of an excessive supply.

#### **Demand for Clothing and Hats.**

There was no special feature in the clothing trade in 1911 except that the extreme heat throughout the summer curtailed the sale of ordinary woolen goods, while it created an extraordinary demand for cotton suits for children and flannel suits for youths and men. Although the price of raw cotton in the latter part of the year was low as compared with 1910, there was only a small decline in the price of cotton cloth. The oversea trade was good.

The same conditions which changed the character of the demand for clothing in the summer months of last year affected the hat trade. The warm summer, together with large hats worn by women, made an unusually long and profitable season. The supply at times was inadequate to the demand. It is stated that wholesale dealers, in view of the enormous disappointments experienced in deliveries in 1911, gave exceptionally large advance orders for the current year.

#### **Popularity of the American Motor Cars.**

The great expansion in the motor-car trade continued in the United Kingdom during last year and was especially noticeable in the increased demand for commercial motors and in the rapid displacement of horse-drawn by motor omnibuses. Notwithstanding the satisfactory results attained in 1911, it is estimated that in 1912 at least

25,000 additional motor cars will be registered in the Kingdom. From the American standpoint the great achievement in 1911 was the triumph abroad—a decided triumph indeed in the United Kingdom—of the low-priced car. At the exhibition held at Olympia last November it was this type of car which attracted the most attention. It is recognized that the touring car is not adapted to the everyday uses of the business man. The annual license fee in the United Kingdom, which increases appreciably with the increase in horsepower, the saving in operating expenses, and facile manipulation are the principal causes of the popularity of the low-priced car.

Special attention should be paid in the United States to the construction of an attractive and artistic body for the cheaper grade of cars, because when other things are equal the style of the car will be the determining factor with the purchaser.

There were 6,778 complete motor cars in 1911 against 4,516 in 1910, valued at \$8,360,564 and \$7,007,575, respectively, imported into the United Kingdom; also 6,672 chassis imported, valued at \$8,389,306 against 6,553 chassis at a value of \$8,134,807 for 1910. The shipments of those built complete in the United Kingdom numbered 4,539 against 3,555 for 1910, and valued at \$8,784,154 and \$6,700,615 for the two years, respectively. The number of chassis exported which were built in the country was 733, valued at \$1,457,023, against 564 chassis valued at \$1,039,172 for 1910. The exports of complete motor cars from the United Kingdom last year of those of foreign or colonial origin numbered 1,047, valued at \$1,501,651, and of chassis 494 at a value of \$743,285.

#### **Motor Trucks and Omnibuses.**

Nothing was more significant in 1911 than the increased use of motor industrial vehicles. It was estimated at the close of the year that about 14 per cent of the business traffic on the streets of London was transported in motor vehicles. All the leading manufacturers have large orders for industrial or commercial motors. The demands are in excess of the supply, as the utility of such vehicles has now been thoroughly demonstrated and they are regarded as not only desirable but as indispensable in all branches of trade.

So successful has the motor omnibus been in London that in seven years about 5,000 horse-drawn omnibuses and 18,000 horses have been retired through the introduction of 2,500 motor omnibuses by the various companies. It is estimated that double the number of omnibuses now in service could be profitably used over the existing routes in London and suburbs. It is stated that "one of the most remarkable innovations in motor omnibus within the past two years is the reduced cost of operation."

One of the great developments of the motor omnibus service, it is thought, will be in the direction of affording an opportunity to working men and women of going a considerable distance in the country on Sunday for a comparatively small expense. Very few railway trains are run in the United Kingdom on Sundays and this offers an additional inducement for the extension of the motor omnibus service.

A further, or at least a new, step in the development of the motor omnibus is the petrol-electric car which is being introduced in London. The advantages claimed for it are, "smoothness and silence of running,

increased power of acceleration, decreased cost of running, maintenance, and lubricants, and the durability of its system of transmitting the power from the petrol engine to the driving wheels." The Great Western Railway Co. is now making experiments with a petrol-electric coach which is an evidence of the competition that is now in progress between different power-producing systems for both rail and road traction.

According to the report of the Commissioners of Customs and Excise, there were 75,617 motor cars in the United Kingdom for the year ended March 31, 1911, on which license duties were collected.

#### **Increased Trade in Motor Cycles and Bicycles.**

Many of the British makers of motor cycles had difficulty in filling their orders last year. There was also a larger demand for high-grade bicycles. The system of selling bicycles on the installment-payment plan is being generally abandoned, and this has contributed to the sale of the high-priced machines. The increased production of bicycles in England, and to some extent in Scotland, last year was due to the increase in the export trade. More than one-third of the bicycles built in the United Kingdom are shipped abroad. The average declared value of the cycles shipped in 1911 was \$19.95, as compared with \$20.44 in 1910 and \$21.41 in 1909.

In 1911, 7,357 motor cycles (the product and manufacture of the United Kingdom), valued at \$1,357,413, were exported as compared with 3,341, valued at \$596,545 in 1910. Only 1,351 motor cycles were imported into the United Kingdom in 1911, valued at \$204,714 compared with 1,387 in 1910, of the value of \$215,571.

There were only 351 bicycles, valued at \$12,492, imported into the United Kingdom last year, against 433 in 1910 at a value of \$14,818, while the number exported last year was 146,718, valued at \$2,926,314, compared with 129,106 in 1910 of the value of \$2,640,130.

#### **Promoting Trade in British Silk Goods—Artificial Silk.**

An earnest effort is being made on behalf of the British silk industry and in 1911 conditions were better than for the previous year. In 1851 there were 130,723 silk workers in the United Kingdom, but in 1901 the number had fallen to 39,035. In the same period the silk workers in the United States had increased from 1,723 to 65,416. Since 1901 the situation has improved and many more people are engaged in the manufacture of silk in the United Kingdom than 10 years ago. During the "All-British shopping week" an attempt was made, through the displays of silks of British manufacture, to increase the demand for home production. The higher class of silk dress materials sold in the United Kingdom come almost entirely from abroad, while silk crape, men's ties and mufflers, silk plushes, and mixtures of silk and wool, all of English manufacture, are extensively sold. The Silk Association of Great Britain and Ireland is to give an exhibition of British-made silks in London in June of this year. The purpose of the exhibition, it is stated, is to demonstrate the advance which has been made in recent years in the variety of makes of English silk as well as in beauty of design and color.

The president of the Silk Association in an address stated "that \$98,043,224 worth less manufactured silk goods had been imported into the United Kingdom since 1903 than in the eight previous years, while the exports of manufactured goods had increased in value by

\$13,456,661." This condition could only be accounted for either by a great decrease in the home consumption of silk goods or a remarkable increase in the home productions. The latter could hardly be possible, since the imports of raw materials had not increased in value.

The most striking feature in the manufacture of artificial silk during 1911 was the progress made by the "viscose" method. The principal market for artificial silk is still provided, it is stated, by producers of embroidery and trimmings. One of the English newspapers, commenting on the artificial-silk trade, stated:

It is finding its way steadily into the piece-goods trade, and it is here that makers of artificial silk are chiefly looking for future developments. It is also being quite extensively employed in the manufacture of incandescent mantles. The state of the artificial silk trade was not satisfactory in 1911, on account of low prices. The world's production of artificial silk for the present year is estimated at 13,227,600 pounds, of which 5,511,500 pounds, it is thought, will be manufactured by the cupro-ammonium process, 4,409,200 pounds by the viscose method, and 3,306,900 pounds by the gun-cotton system.

#### Trade in Chemicals, etc.

The value of chemicals, drugs, dyes, and colors exported in 1911 aggregated \$97,783,237, as compared with \$90,361,834 in 1910. There was a falling off in the exports of bleaching powder to the United States in 1911 of 89,039 hundredweight, the total being 536,635 hundredweight, as against 625,674 hundredweight in 1910. There was a marked increase in the exports of sulphate of copper, 79,831 tons, valued at \$7,343,500, being exported last year against 42,706 tons, valued at \$3,812,538 in 1910. The exports of sulphate of ammonia aggregated 291,883 tons in 1911 of the value of \$18,639,162 against 283,610 tons in 1910 valued at \$16,432,749. The exports of soda compounds amounted to 6,618,880 hundredweight in 1911, against 6,286,747 hundredweight in 1910, but their value fell off in 1911 to \$9,072,820, as compared with \$9,123,481 in 1910. As a rule the prices of chemicals, drugs, dyes, and colors were well sustained during the year, and in fact in some instances prices were so far above the average that the hope has been expressed by the trade that in 1912 a more normal level may be reached.

#### Unsatisfactory Condition of the Tobacco Trade.

Again in 1911, as in 1910, the position of the tobacco trade in the United Kingdom was exceedingly unsatisfactory. In 1910 the number of manufacturers' licenses issued was 383, as compared with 407 the previous year. In 1911 there was a further falling off of 19, making a total number of licenses issued of 364, so that within the last two years 43 tobacco factories have been closed in the United Kingdom. The tobacco trade section of the London Chamber of Commerce presented a memorial, which bore the signatures of many thousands of licensed members of the trade, to the Government, petitioning for a modification of the duties on tobacco. The high cost of all descriptions of leaf tobacco in 1911 was also an adverse influence in the trade. Prices have been steadily advancing for some time past in consequence of an increased consumption that has not been fully met by an increased production.

In a review of the tobacco trade in 1911 the chairman of the tobacco trade section of the London Chamber of Commerce stated in part:

The position was considerably aggravated last year, owing to the disastrous results of the severe drought, which seems to have been prevalent not only in the United States but in every tobacco-growing country of the world, the effect of which not only cur-

tailed the quantity produced, but in many instances affected the quality as well. Nyasaland tobacco is steadily growing in favor with British manufacturers. Last season's import showed considerable improvement both in quality and in the important matter of packing and handling. The tobacco produced in this part of the world has great merits and competes more favorably with the best growths of Virginia and Kentucky than any leaf hitherto imported from British possessions or elsewhere.

#### **British Colonial Tobacco Supplies—Imports and Exports.**

According to the Colonial Office returns, Canada produces annually about 10,000,000 pounds of tobacco, while in 1910 5,500,000 pounds were produced in the Transvaal. The Cape Province is estimated to produce, in addition to small crops of Virginian and Turkish tobacco, about 1,000,000 pounds of "Boer tobacco," while Southern Rhodesia in the present year is expected to produce about 500,000 pounds. In 1910 Nyasaland exported about 1,700,000 pounds, and in 1909 the quantity for Australia is given as 1,400,000 pounds.

The total quantity of unmanufactured tobacco imported into the United Kingdom last year was 118,870,960 pounds, valued at \$19,565,427, compared with 111,257,544 pounds, valued at \$16,719,311 for 1910. The entries for home consumption were 33,409,545 pounds against 40,333,739 for 1910. The total imports from the United States were: Stemmed, 33,546,812 pounds, value \$6,227,490, compared with 27,475,502 pounds, value \$4,578,972 in 1910; unstemmed, 70,782,570 pounds, value \$9,486,511, against 71,475,847 pounds, value \$8,817,645, in 1910. The total quantity of tobacco exported from the United Kingdom last year was 15,532,678 pounds, valued at \$10,473,263, and snuff offals 8,985,995 pounds, valued at \$95,047.

#### **Sources of Chilled and Frozen Beef and Mutton.**

The decrease in the receipts of chilled beef from the United States continued during last year, and during November and December the imports almost stopped. In 1905 the imports of chilled beef from the United States aggregated 2,232,200 hundredweight, while last year the receipts were only 169,444 hundredweight. During the same period the imports from the River Plate increased from 653,560 hundredweight to 3,753,140 hundredweight. The arrivals from Canada in 1911 were only 2,520 hundredweight, against 8,680 hundredweight in 1910 and 13,580 hundredweight in 1909. There was a trial shipment received from New Zealand last year, and the meat arrived in fairly good condition. Four shipments were received from Venezuela totaling 858 quarters against 200 quarters for the preceding year. Of the total imports of frozen beef, amounting to 3,420,071 hundredweight, against 3,766,799 hundredweight in 1910, Argentina furnished 2,357,878 hundredweight, Australia 708,388 hundredweight, New Zealand 257,806 hundredweight, and Uruguay 65,486 hundredweight. Frozen beef from the United States amounted to but 4,906 hundredweight against 7,703 hundredweight for 1910.

The imports of fresh mutton amounted to 117,175 hundredweight, of which the Netherlands furnished 113,386 hundredweight. The total receipts of frozen mutton amounted to 5,220,276 against 5,261,623 hundredweight, of which 1,981,467 hundredweight came from New Zealand, 1,782,066 hundredweight from Argentina, and 1,291,696 from Australia.

**British Meat Supplies—Receipts of Pork and Bacon.**

The total supply of beef available from all sources for consumption in the United Kingdom during 1911 was placed at approximately 1,227,134 tons, and of mutton and lamb at 594,719 tons, or a little over 60 pounds of beef and 29 pounds of mutton and lamb per head of the population. These totals were made up of home-grown meat to the extent of 61.6 per cent, frozen meats 23.7 per cent, chilled beef 10.8 per cent, and 3.9 per cent of foreign live cattle and sheep and fresh-killed mutton.

The receipts of fresh pork last year amounted to 401,107 hundredweight, compared with 429,252 hundredweight for 1910. Of the total last year the Netherlands shipped 370,345 hundredweight and Belgium 14,537 hundredweight. Frozen pork imported amounted to 51,825 hundredweight, of which the United States furnished 4,099 hundredweight, compared with 1,044 hundredweight for 1910. Australia and New Zealand increased their shipments of pork in 1911 over the previous year.

Of the total imports of bacon amounting to 4,868,738 hundredweight last year against 3,863,389 hundredweight for 1910, Denmark furnished the greatest amount, being 2,122,087 hundredweight, followed by the United States with 1,817,835 (an increase of 510,914 hundredweight over 1910), and Canada 615,807 hundredweight. The imports of hams totaled 954,811 hundredweight against 719,126 hundredweight in 1910, of which the United States furnished 887,303 and 665,775 hundredweight, and Canada 62,295 and 37,621 hundredweight for the two years, respectively.

The imports of frozen rabbits in 1911 aggregated 23,393 tons, or 6,795 tons less than in 1910.

**Storage of Meat—Live Stock.**

The Port of London Authority is building a storehouse to hold 84,000 carcasses alongside its premises at Smithfield and is preparing to enlarge its storage supplies at the docks to meet the annual increase of the frozen-meat trade.

There were 200,397 head of live cattle against 219,561 head in 1910 imported into the United Kingdom last year, of which 155,816 head came from the United States, 42,239 head from Canada, and 2,342 head from Channel Islands. The number of sheep and lambs imported was 47,673, of which 42,805 came from the United States and 4,868 from Canada.

There was an increase in 1911 of 100,658 cattle in the United Kingdom, the total being 11,866,111, against 11,765,453 in 1910, but a decrease of 684,780 in the number of sheep, bringing the aggregate down to 30,479,807, against 31,164,587 at the close of 1910. With the reduction in the number of sheep and with an increasing number of cattle being utilized for dairying purposes it is manifest that in 1912 even to a greater extent than last year the supplies of meat for the United Kingdom must come from abroad. The drought of last summer caused the slaughter of a large number of animals to save the abnormal expense of feeding them.

The number of horses on the farms of the United Kingdom was less by 64,000 last year than for 1910, but there was an increase of 472,000, or 20 per cent, in the number of pigs.

**Effect of Drought on Crops.**

The dominant feature of British agriculture in 1911 was the drought which occasioned, it is estimated, a loss of \$97,330,000 on crops and stock. The greatest loss was in the meadow hay crop, which showed a deficiency, as compared with 1910, of 27,500,000 hundredweight. The oat crop decreased 6,000,000 bushels, barley 2,400,000 bushels, clover hay 500,000 tons, turnips 6,250,000 tons, mangels 1,582,000 tons, beans 1,500,000 bushels, and peas 140,000 bushels.

Wheat gave the largest yield of any of the cereals, about 4 per cent above the average, while barley and oats were 5 per cent below normal, beans 17 per cent, and peas about 3 per cent. The potato crop was exceptionally good, being about 10 per cent above the average. The yield of wheat per acre was 32.87 bushels, compared with 30.33 bushels in 1910 and a decennial average of 31.75 bushels. There was a gain in the wheat area in 1911 of 100,000 acres compared with 1910, bringing the total up to 1,900,000 acres. Barley was cultivated on 1,600,000 acres, a decline of 7.6 per cent in the acreage compared with 1910. To the raising of oats 3,000,000 acres were devoted, while 572,000 acres, or 32,000 acres more than in 1910, were planted in potatoes.

**Hop Industry—Farm Holdings—Infectious Diseases.**

There was a slight revival in the hop industry and about 200 acres more were under cultivation than for the previous year, the total area being 33,000 acres.

At the close of last year there were 292,500 farms of 1 to 50 acres in England and Wales. Holdings of 1 to 5 acres increased by 2,085 and those of 5 to 20 acres by 1,601 compared with the previous year.

There were a number of outbreaks last year of infectious diseases among the live stock. A commission has been appointed to inquire into the causes of the foot-and-mouth disease, which proved so disastrous to the farmers last year. Although the State paid \$58,398, the sum was trifling compared with the loss sustained by the stock-breeding industry. Other outbreaks were swine fever, anthrax, glanders, and sheep scab.

**Grants for Agricultural Research—Agricultural Credit Society.**

There was appropriated last year \$91,684, against \$59,858 for 1910, to cover grants for agricultural research in the colleges and universities of the country. Almost all the students in the past who have received a special agricultural education in England and Wales have identified themselves in some way with the land. It is thought by the Board of Agriculture that not less than 10,000 persons in England and Wales should receive special agricultural instruction, although at present provision is made for only a little more than 5 per cent of that number.

A small but promising agricultural credit society was organized last year, which is really the pioneer British agricultural bank. If it proves a success it will doubtless lead to large and important developments, as the experiment is being watched with keen interest by those, and their number is large, who feel that some special facilities should be provided enabling farmers to borrow under proper restrictions on their peculiar assets.

**Promoting the Poultry Industry.**

In 1911, even more than in the preceding year, an effort was made to stimulate the poultry industry throughout the United Kingdom. Demonstration trains were run to show the farmers the best methods of raising poultry and to impress upon them the benefits accrued by devoting more attention to this important department of farming. An appropriation was made out of the development fund for the establishment of a national poultry institute. A capital sum of \$41,365 was set apart for this object, together with a yearly grant of \$9,733, on condition that a like sum be obtained through private donations. It is stipulated in the grant that the institute shall teach poultry keeping, train expert instructors, and conduct research work.

The imports of eggs into the United Kingdom in 1911 aggregated 19,057,895 great hundreds (great hundred=120), compared with 18,344,137 great hundreds in 1910. Russia furnished 10,041,888 great hundreds, valued at \$18,465,487, and Denmark 3,992,986 great hundreds, valued at \$9,881,949. It is apparent that the eggs from Denmark commanded a much higher price on the English market than those received from Russia. The imports from the United States were small. Last year small eggs were sold at \$2.40 to \$4.25 and large eggs at \$2.80 to \$5.30 per great hundred. The higher prices prevailed at the close of the year.

**Imports of Cheese and Butter.**

The total quantity of cheese imported into the United Kingdom in 1911 was 2,348,322 hundredweight valued at \$34,746,528, against 2,456,340 hundredweight in 1910 valued at \$33,140,262. While there was a small falling off in the imports from Canada more than half the quantity came from that country. The imports from the United States rose from 38,247 hundredweight in 1910 to 150,321 hundredweight last year of the value of \$2,102,420. The prices of cheese in 1911 were \$14.60 to \$21.40 per hundredweight, against \$12.65 to \$15.60 for the previous year.

The imports of butter in 1911 into the United Kingdom reached a total of 4,302,956 hundredweight valued at \$119,726,173, against 4,325,539 hundredweight valued at \$119,197,374 in 1910. The increase in value in 1911, notwithstanding the falling off in quantity, was due to the prolonged drought in Great Britain and in various parts of the Continent and to the general advance in the prices of almost all commodities in all parts of the world. Denmark was the chief source of supply of butter to the United Kingdom in 1911, the imports from that country being 1,707,178 hundredweight. The receipts of butter from the United States amounted to 23,316 hundredweight valued at \$587,311, compared with 756 hundredweight of a value of \$19,831 in 1910. The amounts of butter supplied the British market by some of the other countries during 1911 were as follows in hundredweight of 112 pounds each: Australia, 874,399; Russia, 638,284; Sweden, 360,357; New Zealand, 276,446; France, 171,080; Netherlands, 104,655; and Canada, 61,936. The average wholesale prices for butter in 1911 were \$26.75 to \$33.58 per hundredweight, against \$21.90 to \$28.70 for 1910.

**Imports of Wheat and Flour.**

The imports of wheat from the United States last year increased nearly 2,000,000 hundredweight compared with 1910, while wheat meal and flour show a slight decrease. The following table shows the amounts of wheat and wheat meal imported from the principal countries during 1910 and 1911:

Countries.	1910	1911	Countries.	1910	1911
<b>WHEAT.</b>			<b>WHEAT MEAL AND FLOUR.</b>		
	<i>Cwt.</i>	<i>Cwt.</i>		<i>Cwt.</i>	<i>Cwt.</i>
United States.....	10,948,900	12,939,229	United States.....	5,123,780	5,116,411
Russia.....	28,941,600	18,106,100	Germany.....	587,900	282,025
Germany.....	98,100	51,300	Belgium.....	65,250	35,300
Roumania.....	939,200	1,652,300	France.....	438,900	399,700
Turkey.....	134,300	413,800	Austria-Hungary.....	124,207	108,080
Chile.....	633,300	112,700	Argentina.....	101,400	88,000
Argentina.....	15,131,800	14,748,000	Australia.....	407,800	445,000
British East Indies.....	17,916,738	20,161,518	Canada.....	2,783,701	3,268,768

New Zealand.....	630,000	730,500			
Canada.....	16,449,200	14,373,700	<b>Total.....</b>	<b>9,960,491</b>	<b>10,066,132</b>
Other countries.....	281,200	608,620			
<b>Total.....</b>	<b>105,222,638</b>	<b>98,109,067</b>			

**The Fruit Market.**

The imports of raw fruit (excepting bananas) into the United Kingdom in 1911 aggregated 12,921,066 hundredweight, valued at \$45,719,239, against 12,761,838 hundredweight of the value of \$42,261,090 in 1910. Last year 6,714,479 bunches of bananas, valued at \$8,943,099, were imported, against 6,094,579 bunches in 1910, valued at \$8,266,022. There was a slight increase in the quantity of apples imported and a falling off of nearly 200,000 hundredweight in the imports of oranges. With the exception of apricots, peaches, lemons, and plums, there were slight increases in the imports of all other raw fruits.

The great bulk of the imports of American fruit into the United Kingdom consists of apples, the receipts of which amounted to about 1,250,000 barrels (three boxes of California or Oregon apples being regarded as equivalent to a barrel) last year. The fruit in some instances did not come up to the usual standard, which was due, it is said, to the hot weather of the summer and early autumn ripening the fruit a month or six weeks earlier than usual. Prices of all varieties, with the exception of Newtown pippins, varied during the year from \$3.40 to \$4.86 per barrel. The Newtown pippins from Virginia, which were exceptionally fine, realized \$4.86 to \$8.75 per barrel. The California Newtowns commanded \$1.70 to \$2.55 per box, while the apples from Oregon, of which the supply was not great, varied in price from \$3.40 to \$4.13 per box. American apples are popular in the United Kingdom, although they have formidable rivals in the Canadian and Tasmanian products.

There was a shipment of peaches from the State of Washington which caused considerable interest because of the fine condition in which the fruit was received. There were one or two consignments of peaches from Canada, and it is stated that imports from that source will probably increase. Spanish oranges were so plentiful last year and sold at such a low figure that there was only a limited demand for California and Florida oranges.

While improved methods of packing have been noticeable in the fruit arriving from the United States in recent years, there is an occasional complaint, and a comparison instituted between American and Canadian shipments results greatly to the advantage of Canada.

#### **Receipts of Tea and Coffee.**

The year 1911 was one of great prosperity for tea producers, as the increase in values which was characteristic of the latter half of 1910 continued throughout 1911. The prices for Indian and Ceylon tea were higher than at any time since 1897. Duty payments were made on 293,344,000 pounds in 1911, against 287,079,000 pounds in 1910 and 283,551,000 pounds in 1909. The per capita consumption in the United Kingdom in 1911 was placed at 6.53 pounds. The total imports in 1911 aggregated 348,069,492 pounds, valued at \$63,567,882, as compared with 331,847,090 pounds, valued at \$55,385,909 in 1910. The most noticeable increase was in the imports from China, which amounted to 24,817,268 pounds in 1911, against 18,914,720 pounds in 1910.

There was a large decrease in the imports of coffee, as only 785,476 hundredweight were received in the United Kingdom in 1911, against 937,330 hundredweight in 1910, the amount entered for home consumption being 259,849 hundredweight for the former and 266,983 hundredweight for the latter year.

#### **Fluctuations in Prices of Sugar, and Cultivation of Sugar Beets.**

As in other countries, the United Kingdom experienced fluctuations in the prices of sugar owing to the drought which so seriously affected the beet-sugar crop. The cost to the United Kingdom by reason of the increased prices of sugar was estimated at \$82,730,000 to \$97,330,000. Persistent efforts were made in various parts of the country to demonstrate that the sugar beet could be successfully cultivated. Excellent results were secured in Norfolk, where about 250 acres were planted in sugar beets. Experiments which were conducted on the college farm at Wye were regarded with unusual interest, as they were carried out in conjunction with the Board of Agriculture. The gross yield from the 8 different varieties which were planted ranged from 20 tons to 28 tons 16 hundredweight per acre, and the net weight of washed roots was 15 tons 10 hundredweight to 21 tons 12 hundredweight. The sugar in the roots varied from 12.93 to 19.24 per cent. The cost of the crop was \$70.56 per acre. An attempt is being made by a combination of British and Dutch interests to secure the building of one or more sugar factories in England in order to develop sugar-beet culture in the United Kingdom.

#### **The Lumber Market.**

The encouraging features of the timber trade in 1911 were the activity in shipbuilding, box making, and in the manufacture of furniture. Of the total imports of lumber into the United Kingdom last year, Russia supplied 47 per cent, Scandinavia 25 per cent, and the United States and Canada 26 per cent.

The imports of sawn and planed woods in 1911 aggregated 5,572,260 loads (load=50 cubic feet), valued at \$77,688,694, as compared with 5,993,629 loads of the value of \$82,775,218 in 1910. The receipts were the smallest, with the exception of 1908, for the past 15 years.

One of the principal importers in London, commenting on the lumber trade, stated "that the trade had to confront special and unforeseen difficulties, such as the dislocation of trade through the protracted series of labor troubles and the great increase in freights leading directly to an increase in the cost and eventually curtailing the volume of supplies."

The imports of mahogany in 1911 aggregated 104,712 tons, valued at \$4,307,402, against 95,776 tons, valued at \$3,825,030 in 1910. Among American hardwoods black-walnut logs of large size and prime quality were salable at good prices. There was a demand for large, round oak logs; quartered-oak lumber was in fair demand with little fluctuation in prices. The total imports of teak in 1911 exceeded those of 1910 by about 40 per cent and the increased quantity consisted largely of logs. Sawn or split, planed or dressed lumber imported from the United States in 1911 amounted to 412,404 loads, against 412,814 loads in 1910. The imports of hewn wood from the United States increased from 164,709 loads in 1910 to 190,931 loads in 1911.

[An industrial review of the United Kingdom for 1911 will appear in the next issue of Daily Consular and Trade Reports.]

---

### MEXICAN NOTES.

[From message of President Madero to the Mexican Congress.]

#### **New Lighthouses on the Coast.**

A plan for reorganizing the lighthouse service was prepared by a special commission, and the immediate result of its reduction to practice was a saving of \$300,000 in the current fiscal year without detriment to the efficiency of the service. The General Lighthouse Bureau, formerly established at Veracruz, is being transferred to this capital. New lights have been established on the gulf littoral, and it is intended to establish still others. The Pacific littoral has been surveyed with a view to increasing its insufficient illumination and some provisional lights have already been established.

[From the Mexican Herald.]

#### **Railway Construction.**

Work has commenced on the extension to Queretaro of the Acambaro to Jerecuaro railway.

The governor of the State of Puebla has granted a period of two months for the company holding the concession to construct an electric line between Puebla and Atlitxco to present modified plans for the line. Once these plans are accepted, the State government will fix the period of time in which the construction must be completed.

#### **Chemical Laboratory—Ocean Mails.**

The Department of Hacienda has been asked to approve the plans for the construction of a chemical laboratory in the National Geological Institute.

A new mail contract has been made with the French trans-Atlantic company for the transport of mails between Mexico and France. The contract price per sack of mail has been reduced 50 centimes (10 cents).

---

#### **Motor Busses in Canada.**

Consul Felix S. S. Johnson, of Kingston, writes that three double-deck motor busses, to cost \$10,000 each, will be started in North Rosedale, a suburb of Toronto, if the city council passes the recommendation made by the board of control, two of them for a 20-minute service, and the third for emergencies and rush hours. An English company talks of establishing a motor-bus service in Toronto this summer, beginning with about 50 busses, with ultimately about 300 in commission.

**CANADIAN NOTES.**

[From Consul Theodosius Botkin, Campbellton New Brunswick.]

*The log cut of 1911-12* is larger than usual. The exact figures have not been ascertained but the approximate result is 125,000,000 feet; and upon this estimate, for the lumber plants within its jurisdiction, the Restigouche Boom Co. has let the steam-driving contract for this season. The estimate last year was 110,000,000 feet. There is abundance of snow in the forest and the melting is gradual, giving promise of a successful driving season.

*Opening of navigation.*—The 3-foot ice which for five months had safely bridged the Restigouche from tide head to the Dalhousie bar began breaking up May 2. The severity of the last winter may be judged from the fact that substantial ice closed Chaleur Bay as far eastward as a line crossing from Paspebiac on the Gaspé coast to Grande Anse on the Caraquet shore—a condition that had not occurred, I am told, during the preceding 24 winters.

*Grindstone quarries at Stone Haven.*—The treasurer of the Read Stone Co. has furnished the following data pertaining to that company's quarries:

Our quarry area consists of at least 30 acres, of an average thickness of about 20 feet of merchantable stone. A considerable portion of this stone is below tide level and is reclaimed by building large dams; the one under construction at present is 1,400 feet long. The stone is a blue sandstone lying in strata 12 to 48 inches thick. This quarry area has been under its present ownership for 50 years, but was worked for about 20 years before this.

The output of grindstones during 1909, 1910, and 1911 was 2,350 tons, 2,500 tons, and 2,522 tons, respectively. The shipments to the United States during these same years amounted to 1,850 tons, 1,968 tons, and 1,776 tons. The yearly production of cliff stone is approximately 20 tons, shipped to the United States; the value of the annual output of scythe stones, whetstones, etc., is about \$1,000, practically all sold to Canadian purchasers. The average number of laborers annually employed is about 100. The quarry season lasts from five to six months.

---

**Development of Northern Ontario.**

Tenders will shortly be invited at Toronto by the government of Ontario for the Abitibi pulp limit. This is the first step in the government's development policy for northern Ontario, for which \$5,000,000 was appropriated at the last session of the legislature. Incident to the lease of this limit will be the construction of works at Iroquois Falls, and in order to facilitate the development of the district, special conditions will be attached to the lease.

---

**COOPERATIVE FARMING IN SCOTLAND.**

[From Consul H. D. Van Sant, Dunfermline.]

The Dunfermline Cooperative Society's report for the two hundred and second quarter shows a successful year's farming. The association paid \$27,788 to farmers in the district for milk, and received \$57,370 from the milk and butter produced on its farms at Urquhart and Logie together with the sale of milk and butter from other farms not owned by the society. The net profit on farms and dairy combined was \$14,118; on the milk alone the profit was \$9,411.

During the 19 years the cooperative society has undertaken farming, this is the seventh in which a profit has been made on the farms as apart from the dairy. Last year there was a loss on the two of \$15,485.

## WAGES AND FOOD PRICES IN URUGUAY.

[From Consul Frederic W. Goding, Montevideo.]

The food materials consumed in Montevideo (whose population, according to the census of 1908, numbered 291,465) during the months of January and February, 1912, are given, in part, in the following table:

Articles.	January.	February.	Articles.	January.	February.
Oxen.....number..	516	511	Vegetables.....kilos..	2,696,517	2,778,295
Yearlings.....do..	6,554	4,745	Fruits.....do..	516,158	348,650
Cows.....do..	8,476	7,349	Eggs.....dozen..	7,731	17,764
Calves.....do..	2,302	1,965	Fowls.....number..	5,928	6,534
Sheep.....do..	11,654	11,949	Chickens.....do..	6,928	7,680
Goats.....do..	5,213	3,795	Other birds.....do..	817	802
Hogs.....do..	635	718	Water.....liters..	466,033,000	451,320,000
Fish.....kilos..	110,189	99,645			

1 Kilo=2.2046 pounds.

2 Liter=0.26417 gallons.

During the same period the wages received by workers in the various occupations were (the Uruguayan peso being equal to \$1.034 United States gold): Per day—blacksmiths, 1 peso to 1.80 pesos; brick masons, 1.20 to 1.70 pesos; carpenters, 1.20 to 1.85 pesos; day laborers, 1.20 pesos; marble cutters, 1.20 to 1.50 pesos; painters, 1.15 to 2 pesos; pavement workers, 1.30 pesos; peons, 1.20 pesos. Per month—laborers, 13 pesos; male servants, 22.50 pesos; female servants, 14 pesos. Rents averaged, per month, 5 pesos (\$5.17) each person.

The prices for commodities in daily use were approximately as follows:

Articles.	Pesos.	Articles.	Pesos.
Beef:		Fuel:	
Cows.....kilo <sup>1</sup> ..	0.12	Alcohol, denatured.....liter..	0.40
Oxen.....do..	.10	Coal.....hectoliter <sup>2</sup> ..	1.00
Veal.....do..	.12	Kindling (stove length).....pieces..	18.00
Yearling beef.....do..	.11	Prepared vegetable substances:	
Mutton.....do..	.12	Bread.....	
Pork:		First quality.....kilo..	.07
Fresh.....do..	.30	Second quality.....do..	.06
Salt.....do..	.30	Flour.....	
Poultry:		Corn.....do..	.06
Chickens.....pair..	.70	Farina.....do..	.06
Eggs.....hundred..	3.50	Wheat, 1st quality.....do..	.06
Fowls.....pair..	1.00	Wheat, 2d quality.....do..	.05
Geese.....do..	.80	Macaroni.....do..	.12
Turkeys.....do..	3.50	Olive oil.....	
Fish.....kilo..	.07	First quality.....liter..	.48
Beverages:		Second quality.....do..	.36
Coffee.....		Rice.....	
First quality.....do..	.80	First quality.....kilo..	.16
Second quality.....do..	.60	Second quality.....do..	.13
Tea.....		Sugar.....	
First quality.....do..	2.40	First quality.....do..	.18
Second quality.....do..	1.00	Second quality.....do..	.14
Wine.....		Lights:	
First quality.....liter <sup>3</sup> ..	.16	Candles.....	
Second quality.....do..	.14	First quality.....each..	.04
Yerba mate.....kilo..	.30	Second quality.....do..	.025
Dairy products:		Kerosene.....liter..	.06
Butter.....do..	1.12	Matches.....	
Cheese.....do..	.40	First quality.....box..	.02
Milk.....liter..	.08	Second quality.....do..	.01
		Soap.....kilo..	.10

1 Kilo=2.2046 pounds.

2 Liter=1.05608 quarts.

3 Hectoliter=2.83774 bushels.

The prices given are those paid, in cash, by the wives of the laborers who visit the markets each morning to purchase their daily supplies.

It is difficult to ascertain average daily expenses, as the wants and desires of each family vary so greatly.

The prices given below, which are those of some of the garden vegetables sold in the local markets, will bear on the question of the cost of living in Montevideo:

Vegetables.	Price.	Vegetables.	Price.
Basil.....dozen bunches.	\$0.04-\$0.06	Peppers, chili.....dozen.	\$0.04-\$0.40
Beans, string.....2.2 pounds.	.30-.40	Potatoes.....220.4 pounds.	3.50-4.00
Cabbage.....dozen.	.20-1.00	Potatoes, sweet.....do.	5.00-6.00
Carrots.....dozen bunches.	.20-.40	Pumpkins.....each.	.10-.40
Chicory.....do.	.12-.20	Radishes.....dozen bunches.	.08-.12
Corn.....dozen.	.10-.20	Salsify.....do.	.20-.80
Eggplant.....do.	.12-.30	Spinach.....do.	.30-.40
Endive.....dozen bunches.	.06-.20	Tomatoes.....dozen.	.08-.30
Garlic.....bunch.	.08-.12	Turnips.....dozen bunches.	.20-.30
Leeks.....dozen bunches.	.20-.30	Vetches.....2.2 pounds.	.30-.40
Lettuce.....dozen.	.06-.20	Water cress.....dozen bunches.	.20-.35
Muskmelons.....each.	.04-.20	Watermelons.....each.	.10-.40
Onions.....2 dozen.	.08-.12		

### RAISING OSTRICHES IN MADAGASCAR.

[From Consul Louis Goldschmidt, Nantes, France.]

The following information relative to raising ostriches in Madagascar has just been published by a commercial journal of Nantes:

Ostriches were first imported into Madagascar in 1902; five pairs were offered to the Government and placed on a farm at Tulear. The beginning was hard, and a pair of birds died after a few months. The ostriches were then transferred to Beticky, where their raising became easier, owing to better climate and an abundant supply of grass. In 1904, the imported ostriches having reached their full growth, young ostriches were hatched, and in 1909 the Beticky farm had 228 birds. Trials with artificial incubation proved unsatisfactory; natural incubation, on the contrary, was successful. In the past few years, however, new incubators were used and the results have been promising.

The acclimating of the ostriches in the southwest of Madagascar has been entirely satisfactory, and the Government has just opened a new farm at Marovoay, near Majunga. The birds born at Beticky are stronger than those which were imported; the race is improving, and it is expected that before long Madagascar ostriches will successfully compete with those of the Cape Colony.

The production of feathers has given promising results, and the following figures show that the sales are increasing: 1907, \$213; 1908, \$751; 1909, \$1,061; 1911, \$2,550.

At Paris white feathers, slightly tinted, sell for \$164.05 per 2.2046 pounds; white feathers, first grade, \$92.65; "Bayoque" feathers, \$86.80; and gray feathers, \$12.15.

### CEMENT FACTORY CONCESSION IN PERU.

With reference to the project for a Portland cement factory in Peru, referred to in foreign trade opportunity No. 8309, in Daily Consular and Trade Reports for March 9, 1912, Consul General Eduardo Higginson, of Peru, located at New York, writes to the Bureau of Manufactures that he has received the following cablegram from his Government:

Under date of April 26, 1912, the Government rejected the reconsideration solicited by Mr. Rospigliosi, leaving in full force the exclusive privilege granted to Mr. Garcia Lastres for 10 years, to manufacture Portland cement.

Consul General D. F. Wilber, of Vancouver, transmits press accounts of "Car shops for Port Mann, British Columbia," and "Plans for Great Northern Railway improvements in Vancouver," both of which will be loaned to firms applying to the Bureau of Manufactures.

**FAR EASTERN TRADE NOTES.**

[From Consul General George E. Anderson, Hongkong.]

**Hongkong Wireless Station—Hosiery Trade.**

It is announced that the naval authorities at Hongkong are to erect the wireless telegraph station they have long discussed, but that there will also be erected a commercial station of comparatively smaller power. While business circles in Hongkong are not satisfied with the proposed arrangement, it will be so much better than no wireless service at all that they are disposed to accept it without complaint.

An unusual stimulus to the trade in hosiery in this part of China has been given by the increased production of hosiery mills in Japan, particularly at Osaka. Imports of hosiery of the cheaper grades are growing rapidly in the open ports of China in spite of the immensely increased output of local hosiery makers. The Japanese makers are turning out cheap-grade goods especially manufactured for the Chinese market and are securing increasing business.

**Silver Exchange—Indo-China Rice.**

The uncertainty of silver exchange is having a marked effect upon all lines of business in China, and the power of China to absorb silver is one of the chief elements of uncertainty in the situation. As bearing upon this question it is pointed out in Eastern publications that in the past two years India has absorbed £42,400,000 (\$206,339,600) of gold and silver imports (net) as a partial offset of the balance of trade in its favor of £100,300,000 (\$488,109,950).

In consequence of the fact that the rice crop of Cambodia is reported as more or less of a failure the Government of Indo-China has prohibited the export of any grain of Cambodia production for the time being. Rice exports at Saigon up to the middle of March have been reported at 38,268 tons, as compared with 101,923 tons for the same period last season. The prices quoted the present season are on the basis of \$5.92 local currency per picul, or substantially 2 cents gold per pound, as compared with \$5.18 local currency or about 1.6 cents gold per pound at the exchange then obtaining at the same time last season.

**New Chinese Coinage.**

The provisional government at Canton is issuing the new 20-cent pieces for which provision was made some time ago. The coins are the first to be issued under the new government in China, and instead of the well-known dragon design the coin bears on one side Chinese characters for "Republic of China, First Year, Kwangtung Province." On the other side are the words "Kwangtung Province, Twenty Cents," in English.

The plans of the Government are to issue these coins to the face value of about \$8,000,000 local currency, the coins to contain silver to the actual value of about \$7,000,000 local currency. Notes will be issued against the coins probably to the value of about twice the face value of the coinage issue. While it is recognized that this issue will make the reform of China's currency more difficult to the amount it represents, the authorities consider that the force of present exigencies makes this action necessary. The coins are substantially the same in

value and nature as the vast issue of 20-cent pieces and other subsidiary coinage which has been made by various Provinces in China during the past seven or eight years.

[For other articles having a bearing on the monetary system of China see the following 1911 issues of Daily Consular and Trade Reports: Sept. 16, p. 1242; Oct. 28, p. 502; Oct. 30, p. 521; Dec. 16, p. 1369; Dec. 22, p. 1474; and also a previous report from Consul General Anderson that was published on Jan. 2, 1912.]

## SOUTH AFRICAN COMMERCIAL NOTES.

[From the British and South African Export Gazette.]

**Tins.**—About 50,000 empty paraffin and petrol tins will be required by the Orange Free State Forestry Department, for which tenders are now being considered.

**Motor club.**—An indication of the growth of the motoring movement in Orange Free State Province and the demand for cars is the formation of the Orange Free State Automobile Club.

**New rolling stock** to the value of \$2,190,000 is being added to the equipment of the South African Government railways, a portion being under construction at the local railway workshops.

**The cycle trade** is evidently booming at Nairobi. No fewer than 1,050 machines were registered there in five recent weeks. The extent to which Rhodesia is also a market for bicycles and motor cars is indicated by the fact that nearly 3,000 of the former and 45 of the latter were licensed in Bulawayo alone last year.

**Machinery orders.**—Although the huge sum of \$68,165,000 was spent on mining machinery and stores in the Union of South Africa in 1911, it is not improbable that this will be exceeded this year, owing to new installations projected and the increasing tendency to adopt labor-saving appliances wherever possible.

**Basket trade.**—The Natal Wickerwork Co. (Ltd.), has about 2,000,000 osier cuttings growing near Edendale, at which place it has a basket-ware factory. There is a good market for this class of goods, especially for fruit baskets, which are largely used in the Cape Province, and poultry baskets for sending birds to market or to shows.

**Traction plowing.**—A writer in the Rhodesia Agricultural Journal speaks of the scope for steam-plowing tackle to do useful and profitable work in Rhodesia and makes enthusiastic reference to the performance of a large eight-furrow American plow drawn by one of the fine single cylinder 25-horsepower traction engines built by a firm in Gainsborough, England.

**Credit restrictions.**—Some South African merchants are again urging the abolition of the extended credit system, attention being drawn more particularly to the position of wholesale merchants, who get only 60 to 90 days' credit and then have to wait six months or more for payment of their own accounts. The trouble, of course, is deep-rooted in the customs of the market from the public upward, but storekeepers could do much by making their cash business more attractive.

**Electrical plant.**—One of the leading Johannesburg newspapers has installed a complete electrical plant for lighting, heating, and power purposes. Some 500 incandescent and 10 arc lamps are included in the lighting plant. The heating provides for 100-kilowatt and the power totals 120 horsepower, the principal motors being of 45 horsepower of the interpole direct-current type, 460-500 volts. It is not so long since contracts on this scale emanated only from Government departments, municipalities, and mining companies.

**Railway shops.**—The list of important British industrial concerns that have established works in South Africa, or contemplate doing so, is growing steadily. One of the latest additions is a railway car works of a Birmingham firm, which is considering establishing a branch which would not only serve the South African market, but the whole of the Southern Hemisphere. Bloemfontein may be the location of the projected enterprise, which is not surprising in view of its central position in regard to the railway system and also of the lead given by the Government in establishing its own works there. The importance and value of the business which will be contingent on the South African railway construction program for some years to come certainly justify the boldest enterprise designed to profit by it.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

**No. 8849. Tenders for station and other buildings.**—Sealed tenders addressed to the Commissioners of the Transcontinental Railway, Ottawa, Ontario, Canada, will be received by them until May 31, 1912, for the erection of station and other buildings required along the line of the Transcontinental Railway. Plans and specifications may be seen and full information obtained at the office of Mr. Gordon Grant, chief engineer, Ottawa, or at the various district offices.

**No. 8850. Underwear, hosiery, and cotton goods.**—One of the commercial agents of the Department of Commerce and Labor reports that a firm in the Levant desires to get in connection with American manufacturers of underwear and hosiery. There is a large demand for hosiery which can be retailed at 15 to 25 cents per pair, and this firm is prepared to do a large business in the lines mentioned. The same firm would also be pleased to hear from manufacturers of gray sheetings and drills of 36 inches width and 3 yards per pound and of gingham.

**No. 8851. Soda ash and caustic soda.**—An American consular officer in a European country reports that a business firm in his district is in the market for a combined order of soda ash (98/100 per cent) and caustic soda (75 per cent), amounting to about 3,000 tons. Correspondence should be addressed to this firm without delay.

**No. 8852. "Tissue foil."**—A business man in Canada recently requested correspondence with American manufacturers of window-sign letters, and he has informed an American consular officer that none of the replies were from firms manufacturing what he wishes. He is particularly interested in what is known as "tissue foil," which he states is of gold and tin and of silver and tin. American manufacturers of such articles should get in touch with this merchant as soon as possible.

**No. 8853. Telephone equipment.**—A European city is about to reorganize its telephone system and to establish 10 central stations instead of the present outgrown system of one central only. Only local firms will be allowed to compete for the orders to which this work will give rise, but such firms will be permitted to offer equipment materials from foreign countries. One local firm, which proposes to submit tenders, has informed an American consular officer that it desires to get in touch with firms in the United States wishing to offer equipment for centrals. Price lists with best terms should be sent immediately direct to this firm, as the tenders are to be made out during June. Correspondence on this subject addressed to the consular officer in question will also be delivered to other local firms of good standing.

**No. 8854. Cars and light rails.**—An American consul reports that several cacao planters in his district have requested to be furnished with catalogues and price lists of cars and light rails with the intention of installing same to carry their cacao from the fields where it is grown to the drying house. The type of car and rail wanted is of the cheapest kind, not only because most of the planters have but limited capital, but also they prefer to order goods when possible from their own country rather than from the United States. No railways have been installed yet on the plantations, but if the owners can get cars and rails at satisfactory prices from the United States they are ready to place orders.

**No. 8855. Cotton goods and waste.**—A report from a commercial agent of the Department of Commerce and Labor contains the information that a firm in Turkey would like to buy cotton waste, particularly motes, strippings, and flyings, and desires to communicate with American exporters of the same. Samples and prices c. i. f. Turkish port should be sent with first communications. The same firm also handles cotton goods and would like to hear from manufacturers of heavy sheetings, drills, and gingham.

**No. 8856. Tramway materials.**—The appropriations for the year 1912-13 for the Osaka, Japan, municipal electric tramways provide for the extension of the system by about 6 miles, and a large quantity of materials, to the extent of about \$1,985,532, will be ordered from foreign sources. The principal items will include rails, motors, brakes and other truck apparatus, and copper wire. Bridge material is also likely to be required.

- No. 8857. Iron fencing and tiling.**—An American consulate in the West Indies has been asked for catalogues of plain and ornamental iron fencing and of plain and ornamental tiling for outdoor and indoor use. Prices f. o. b. Mobile or New York should be quoted, as well as any discounts.
- No. 8858. Conveyor belt for ore handling.**—Tenders will be received for 1,200 linear feet articulated conveyor belt for ore handling. Particulars may be obtained upon application to Mr. Ivan C. Barling, Royal Exchange, Middlesbrough, Yorkshire, England.
- No. 8859. Wireless-telegraph stations.**—The Post and Telegraph Department, St. Petersburg, Russia, will accept tenders for wireless-telegraph stations on the White and Kara Seas, at an estimated cost of \$51,000.
- No. 8860. Railway construction.**—The Russian Government is prepared to receive tenders for the construction of a line from Orel to Narva, 612 miles, at an estimated cost of \$34,065,500.
- No. 8861. Refuse destructor, etc.**—Tenders will be received until June 5, 1912, for the supply and erection of a refuse destructor and steam-raising plant in connection with the electricity generating station, Quadrant Street, Canning Town, for the West Ham town council, West Ham, Essex, England. Plans, specifications, form of tender, and further particulars may be obtained at the office of the borough engineer, Town Hall, West Ham, London, E., England, upon payment of \$4.86, which will be returned upon receipt of a bona fide tender. The contractor will be required to enter into a bond, with one surety, for the performance of contract. Rate of wages, etc., clause to be observed.
- No. 8862. Purification of water supply.**—The Canal Commission, Madrid, Spain, will receive tenders until July 31 for a scheme for the filtration and purification of the Madrid water supply. Particulars from the Junta del Canale 11, 3 Calle Alarcon, Madrid, Spain.
- No. 8863. Motor generator and generator sets.**—The Railways and Tramways Department, Sydney, Australia, will receive tenders until July 1 for one 200-kilowatt motor generator set; until July 15 for two 120-kilowatt motor generator sets. Specifications Nos. 342 and 344 may be obtained of the Electrical Engineer, Hunter Street, upon payment of 60 cents.
- No. 8864. Letter-box fronts.**—Tenders are invited until June 5, 1912, for the supply to the Postmaster General's Department in Queensland of letter-box fronts. Tender forms and specifications may be obtained at the Commonwealth Office, 72 Victoria Street, London, S. W., England.
- No. 8865. Cable.**—The Postmaster General, Melbourne, Australia, will receive tenders until June 18 for 50½ miles paper-insulated lead-covered cable (No. 717).

### PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

- No. 652. Ordnance supplies.**—Sealed proposals in duplicate will be received at the office of the Chief of Ordnance, United States Army, Washington, D. C., until June 1, 1912, for furnishing and delivering f. o. b. contractor's works various ordnance supplies required. Drawings and prints covering these articles can be obtained from the office named.
- No. 653. Panama Canal supplies.**—Sealed proposals in triplicate will be received at the office of the General Purchasing Officer of the Isthmian Canal Commission, Washington, D. C., until June 7, 1912, for furnishing lumber, balcony railings, stair balustrades, elevator inclosures, grille for cashier's office, and steam road roller. (Circular No. 710.)
- No. 654. Filing furniture.**—Sealed proposals for furnishing filing furniture for the Department of the Interior during the fiscal year ending June 30, 1913, will be received until May 27, 1912. Blank forms of proposals containing specifications and necessary information can be obtained by applying to the Secretary of the Interior, Washington, D. C.

**VENEZUELAN TRADE NOTES.**

[From Consul Thomas W. Voetter, La Guaira.]

**New Vessels for Netherlands' Line to Americas.**

The Dutch Royal West Indies Mail Line is having built two steamers for its service from Amsterdam to New York via Suriname, Venezuelan ports, Curaçao, and Haiti. These steamers will be of slightly greater capacity than the *Oranje Nassau*, now the largest steamer on this line, of about 3,000 tons net. The new steamers will have smaller accommodations for passengers than the *Oranje Nassau*, and it is expected that the first one will be ready for service by the end of this year.

**New Cable—Low Water in Orinoco.**

An item in the *Gaceta Oficial* states that the Ministro de Fomento, at Caracas, is to purchase and install a new submarine cable between Puerto Miranda and San Fernando de Apure in the Apure River to replace one that is unserviceable.

A clipping from a Ciudad Bolivar newspaper states that recently the water level in the Orinoco has been the lowest on record. Two causes are given. One is the long dry season, while the second is stated to be that more water is now passing to the south through the Casiquiare to the Rio Negro, a tributary of the Amazon. It is reported that the channel of the Casiquiare is now much wider than before in the part where it touches the Orinoco.

**New Industries—Wagon-road Construction.**

An item in the *El Tiempo*, of Caracas, of April 29, states that the stock company *Fabrica de Vidrio y Cristal* will establish the following industries: A soda factory for making glass, one for calcined potash, and a third of crystallized sulphate and construction of a continuous oven for finishing dark glass.

A wagon road is being constructed from near Maracay, a railroad station between Caracas and Valencia, northward to the coast at Ocumare. There is a port at Ocumare at which the coasting steamers now touch. When the new road is completed much cacao and coffee which now goes by rail to La Guaira or Puerto Cabello will be brought to Ocumare and taken by boat thence to one of the two ports mentioned. The use of automobiles to transport the cacao from Maracay to the new port at Ocumare is contemplated.

---

**Metal Goods for China.**

Consul General Samuel S. Knabenshue, of Tientsin, states that there is a fair demand in China for sheet metal, especially corrugated galvanized iron, and the outlook is for a large increase in the trade, as business becomes settled. Spanish tile, metal shingles, and steel ceilings have not yet been introduced at Tientsin, but a demand could probably be created if an agent were to bring them to the attention of builders.

---

*Resin* imports at Manchester, England, amounted in 1911 to 8,761 tons, or about the annual average, of which 90 per cent is American.

## INDUSTRIAL REVIEW OF UNITED KINGDOM.

[By Consul General John L. Griffiths; supplementing the commercial review published in Daily Consular and Trade Reports for May 22, 1912.]

### Increased Earnings of the Railways.

There was a great deal of unrest among railway employees in the United Kingdom in 1911, and in August a strike was inaugurated, but it was not as general or as prolonged as anticipated. Notwithstanding the handicap of strikes, there was almost continuously throughout the year an increase in the gross revenues of the British railways. In the first six months of the year there was an increase in the total revenue of 12 of the leading companies of about \$7,299,750. The expenses during the same period advanced about \$3,406,550, leaving a net gain of \$3,893,200. The second half of the year the strikes occasioned a loss in gross revenue of about \$2,433,250. Increased dividends were paid by a number of the English companies for the first six months of the year, and the five leading Scotch railways increased their gross revenue in comparison with 1910 by about \$535,315.

There was an absence in 1911 of any large new issues of British railway capital, and practically nothing was done in the way of extensions or the building of new lines, but several amalgamations were effected and additional working arrangements between certain railways consummated. The use of electricity in the metropolitan and suburban services was extended.

During last year there was an increased inclination to abolish second-class fares on a number of the railways, leaving only two classes—first and third. The year closed with a promise of good traffic and improved dividends.

### Real-Estate Market—Aeronautics.

The real-estate market was much better last year than in 1910, which was one of serious depression. A great number of large estates were subdivided and put on the open market, and there was a growing disposition to lease or purchase these properties. The increased cost of living in the large cities and cheaper traveling facilities continued to accelerate the movement to the country. Residences from 30 to 50 miles from London were in greater demand than ever. On the other hand, manufacturers who advocated locating

their works in the country are discovering that while the operating rates are lower outside of the large cities, there is, nevertheless, a decided advantage in being located where labor can be easily procured.

A growing interest was manifested in aeronautics last year. An announcement was made that it was the intention of the Government to proceed immediately with the training of 100 officers as military pilots and observers. Machines for these airmen will be provided after a thorough test of military aeroplanes under the supervision of the War Office. The trials will be open to the manufacturers of all countries, the primary purpose being to secure the best machine for military use, special attention being given to its portability, speed, and weight-carrying capacity.

#### **The Electrical Industry and Trade.**

Last year the electrical industry experienced a large measure of prosperity in the United Kingdom, so far as the output was concerned, but it is claimed that price cutting was so general and severe that the returns from dynamos and motors fell to a point where they could not be sold at a profit. As a result of the recent coal strike, attention has been widely directed to the use of electricity for motive power, lighting, cooking, etc. The manager of one of the electric companies in London stated recently that his company had orders for nine months ahead for motors, which would tax the full capacity of its works. The electrification of railways was carried on to a greater extent in 1911 than in the preceding year, especially in London and the north of England.

There was an increased demand for electric equipment in consequence of the improvement in the shipbuilding trade. A series of interesting and successful trials was made with a small electrically driven vessel on the Clyde, and those who were familiar with the experiments believe that large cargo ships will soon be built on the same principle.

Electrical goods and apparatus other than machinery and telegraph and telephone wire were imported to the value of \$6,311,110 against \$7,236,884 for 1910. The exports of these goods were valued at \$13,561,182, against \$18,015,811 in 1910, of which \$12,687,218 and \$17,093,882, respectively, represented British products. The imports of electrical machinery amounted to \$4,743,022 for 1911 against \$2,531,991 for 1910, and the exports of British manufactured machinery were valued at \$7,975,458 and \$7,088,592, respectively.

#### **Operation of Tramways—Business Failures.**

The capital expenditure of the tramways in the United Kingdom has grown from \$20,475,000 to \$368,260,000 within the past 20 years, the number of passengers transported from 146,000,000 to 2,907,000,000, and the net receipts from \$1,221,000 to \$25,675,000. Of 1,744 miles of line belonging to local authorities at the end of March, 1911, 1,530 miles were operated by themselves, or in a few cases by other local authorities leasing from them. Of the 2,597 miles of tramways in operation, 2,467 miles were electrified. Of the 296 tramways in the United Kingdom, 174 belong to local authorities, and the net receipts from these amounted to \$18,733,000, of which \$5,736,600 was applied to the reduction of tramway debt, \$1,802,722

to the relief of rates, and \$4,324,562 was carried to reserve and renewal funds.

The number of failures in the United Kingdom in 1911 aggregated 8,359, against 9,040 in the previous year. The total liabilities under deeds of arrangement in England and Wales were \$21,336,322, against \$18,369,826, while the assets equaled \$10,164,829, against \$9,448,927. Liabilities under deeds of arrangement in Ireland in 1911 were \$1,902,281, against \$1,800,809 in 1910, with the assets at \$896,614, compared with \$1,173,571.

#### **Increased Cost of Living—Unemployment.**

The labor troubles, which were so serious at times in 1911, were due in a great degree to the increased cost of living and the feeling on the part of wage earners that there had not been a corresponding increase in wages. Rents and almost all commodities which entered into the general cost of living of the average family were higher in 1911 than in 1910. In 45 representative commodities the average price was 2 points higher than in 1910, 6 points higher than in 1909, and 10 points higher than in 1904. Articles of food were 10 per cent higher at the close of 1911 than at the close of the previous year. In vegetable food, corn, etc., there was a rise in value of 18 per cent as compared with 1910; of 28 per cent in the price of sugar, coffee, and tea; a decrease of 1 per cent in the price of animal food (meat and butter), and a decrease of 10 per cent in the price of textiles.

Returns relating to about 800,000 members of trades unions in the United Kingdom showed a falling off in unemployment in 1911 of 1.7 per cent compared with 1910 and 4.7 per cent compared with 1909. In reviewing the labor conditions of the year the British Board of Trade stated that employment in the woollen and worsteds, carpet, hosiery, bleaching, dyeing, pottery, and woodworking trades was generally good.

#### **Wages and Hours of Labor—Emigration.**

There was a slight increase in wages paid in 1911, the net effect of all the changes being an increase of \$126,173 a week in the wages of 825,204 people. Of this number, 416,191 received a net increase of \$183,291 per week, and 399,216 sustained a net decrease of \$57,118 per week.

The changes in weekly hours of labor which became operative in 1911 affected 105,537 working people. Of this total, 4,337 had their hours increased by 13,905 per week and 101,200 had reductions amounting to 574,140 hours a week. There were 864 trade disputes, involving 931,050 people, being about 9 per cent of the total industrial population of the United Kingdom, excluding agricultural laborers, and the time lost was 10,247,100 days, of which 4,072,400 days were on account of those engaged in coal mining and 2,698,400 days by those employed in the transport trades.

Last year 349,300 persons, of whom 315,800 were British subjects, left the United Kingdom for various parts of the Empire, against 293,700 in 1910. Of this number 213,300, compared with 196,300, went to British North America, and 69,000, against 36,300, to Australia. The emigration to foreign countries declined from 325,200 in 1910 to 274,000 last year, the number leaving for the United States being 250,900, compared with 303,400 for 1910.

**Patent Applications and Foreign Investments in Plants.**

Applications for patents to the number of 29,353 were filed in the United Kingdom in 1911, which was a decrease of 1,035 compared with 1910. The largest class of patent applications related to motor cars. Another subject which occupies the attention of many British inventors is petrol engines. Several of the engines were designed for aeroplanes. Inventions relating to aeronautics, games, electrical devices, and advertising were prominent among the applications filed.

A large number of foreign manufacturers have established plants in the United Kingdom in order to be protected by the patents and designs act, which provides that the Comptroller of Patents is authorized, upon proper proof, to revoke within a given time any patent granted in the United Kingdom upon the ground that the patented article or process is manufactured or carried on exclusively or mainly outside of the United Kingdom. The effect of said clause is shown in the following foreign investments for 1911: Value of land and premises acquired, \$1,060,362; amount expended on buildings, machinery, etc., \$4,132,056; amount paid as rates per annum, \$107,063; number of workpeople employed, 9,000; weekly wages, \$48,665; number of foreign firms working, 60; and number of English firms manufacturing for foreign firms on royalty basis, 35.

**Economic Legislation Enacted.**

A great deal of what may be described as social and commercial legislation was enacted by the British Parliament last year. Several changes were made in the old-age pensions act which greatly enlarged its scope. A stringent coal-mines act was passed which provides for the improved ventilation of mines, closer managerial supervision, restrictions in reference to the use of electricity and in regard to safety lamps, measures of dust prevention, new arrangements to prevent accidents to cages, etc. Under the shops act all shop assistants, except where the special conditions of certain trades render it impracticable, are assured of a half-day holiday in each week and of sufficient time for their meals. Laws were passed dealing with humidity and ventilation in cotton-cloth factories for the purpose of improving the conditions surrounding the employees in that great industry. A law was enacted which was described as a "temporary measure for the protection of the public against dangers arising from the navigation of air craft." The design of this law was to prevent the sailing of air craft over large cities, and to regulate their use so as to permit experimental work to be conducted and yet at the same time to safeguard the public. Laws were enacted for the purpose of promoting the interests of agriculture, forestry, and other rural industries in Scotland. A law was passed to prevent the use of fraudulent trade-marks on imported goods, and the copyright law was revised. Further protection was extended to animals by the passage of a law fixing a maximum penalty of \$121 instead of \$24 for cruelty to animals and extending the term of imprisonment from three to six months.

The most important measure was the national insurance bill, which becomes operative on July 15, 1912, and which will benefit about 14,000,000 persons. The act provides a scheme to which the

State, the employer, and the employee contribute in varying proportions for the furnishing of medical benefits and to cover periods of unemployment. An important feature of the bill is the provision which it makes for the establishment of sanitariums for the treatment of tuberculosis which is one of the most dreaded diseases in the United Kingdom. [The provisions of the national insurance bill were printed in the Daily Consular and Trade Reports for June 28, 1911.]

**Government Control of Telephone Lines, and Telegraph and Cable Service.**

At the close of last year the property of the National Telephone Co., which was capitalized at \$77,864,000 and gave employment to 18,000 persons, passed under Federal control, and by the transfer private telephone ownership, excepting a few isolated lines, ceased in the United Kingdom. A night telegraph letter service was instituted January 1, 1912, between London and points in Scotland and Ireland at the rate of 12 cents per 36 words and 1 cent for every additional 3 words. Toward the end of last year a week-end cable service was inaugurated between the United Kingdom, the United States, and Canada at greatly reduced rates. Improved telephonic communication with the Continent was established by the completion of the new channel cable.

**Introducing American Goods on the English Market.**

A gratifying feature of the work of the London consulate general last year was the knowledge that the office was being brought into close touch with the American exporter. An increased number of letters were received expressing appreciation of information furnished, with an intimation in several instances that it was believed valuable business connections would be formed.

When the American manufacturer has decided that he wants to enter the English market he should, if he expects to do business throughout the country, communicate with the consul general in London, or if he intends to confine his sales to a particular locality, with the consular representative in that special district. He will be informed through this channel of the general conditions of the trade in the United Kingdom as affecting the article or product in which he is interested; the extent of the demand; the character and source of the supply, embracing not only the domestic production but the imports from abroad; the prevailing prices; and the names of persons who would be pleased to enter into correspondence with him. If the preliminary information is satisfactory, then he should, whenever it is possible to do so, send a personal representative to make an exhaustive examination of the local conditions. If after this is done the manufacturer still thinks that the foreign trade will be profitable, three courses of action are open to him. He can secure an agent who represents other manufacturers, or a solo agent, or establish a central office or business house, preferably in London, with branches, if necessary, in the principal cities of the United Kingdom. The agent who represents a number of interests is certainly not as desirable as one who will give his undivided time, knowledge, and energy to a single employer. In the case of typewriters, cash registers, motor cars, motor cycles and bicycles, sewing machines, pianos, and all kinds of machinery, it is most desirable to have a central London

establishment and to organize branches as the extension of the business may require.

**Emergency Orders, Prices, Packing, etc.**

There should always be a sufficient stock in the United Kingdom to supply emergency orders and to provide parts of machines which may be damaged and which have to be quickly replaced to avoid serious inconvenience and loss. Prospective purchasers of machinery almost invariably ask if duplicate parts can be readily obtained. All prices should be given in British currency, and all weights, dimensions, and measures in British equivalents. Special attention should be paid to packing. Goods must ordinarily be sold on the terms of credit, which are governed, of course, by local custom. Export trade can only be retained by prompt and regular deliveries. It is useless to expect to hold it if it is regarded simply as an opportunity to dispose occasionally of surplus stock. It must be treated with the same consideration as the home market, and indeed it might almost be said with greater consideration because of the difficulty in correcting mistakes. The American manufacturer must not be easily discouraged. The London manager of an American house some time ago remarked that during the first three years after its establishment he had been unable to meet expenses, but that during those three years he had advertised judiciously and in every way sought to bring his goods to the favorable attention of possible consumers, and in the fourth year he was able to report a successful result. The length of time required to establish the business was due in part at least to English conservatism, and this conservatism is a factor which must be considered. The English buyer is reluctant to form new alliances, but when he does he is equally reluctant to change them.

The published statistics of the trade of the United Kingdom show that nearly one-quarter of all the imports into the country from foreign countries (excluding British possessions) comes from the United States, and that nearly one-fifth of the total imports from foreign countries (including British possessions) comes from the same source. It is indeed a good market, a growing market, and a market worth striving for.

---

**SAMPLE EXHIBITIONS IN TURKEY.**

[From Consul General George Horton, Smyrna.]

The sample exhibition which the British Chamber of Commerce here plans [as noted in Daily Consular and Trade Reports for May 9] is intended to be run entirely in the interests of British import trade to Smyrna. It is proposed to rent a large store in a central part of the town where exhibits can be displayed, thus giving to the exhibitors all the advantages of advertisement at a comparatively small cost. The exhibition will undergo constant change through renewals, improvements, and additions, and the visits of commercial travelers will be encouraged.

The Société Hongroise de Banque et de Commerce has already established showrooms on the above lines for the development of its interests; the exhibit, however, consists solely of such articles as are manufactured by business houses which it represents. Judging from all appearances its scheme is a decided success.

### NEW BREWERY IN CHINA.

[From Vice Consul General W. Roderick Dorsey, Shanghai.]

The first brew from Shanghai's new Union Brewery was placed on the market April 1. It was established by an old firm of Tsingtau, is three stories high, and constructed of brick and concrete. It cost \$180,000 gold and is the first brewery in Shanghai. Plans for the plant were sent out from Germany early last year, and construction work was carried on under the direction of a local German architect. Living quarters are provided for the brewing master and offices fitted up for the foreign staff.

Prior to starting the enterprise samples of Shanghai water were sent to Berlin and were pronounced by Prof. Wintisch, of the Royal Brewing Faculty, to be equal in quality to water used in Germany for brewing purposes.

The hops and malt, which are imported from Moravia, are brewed in two large vats and pumped into tanks on the roof, whence the beer flows over cooling pipes into other tanks on the ground floor, where it remains for a day, and is pumped into vats connected with the refrigerating plant. Here, after fermenting for 10 days, it is placed in barrels in cold storage and left for three months. The installation was completed in December, when brewing commenced. The brewery opens, it is said, with 40,000 gallons of beer, the plant's full capacity. Two kinds of beer are produced, one similar to Pilsen, the other to Munich.

A 60-horsepower engine operates the machinery and also a private electric plant. The kegs have been brought from Germany and the bottling department is equipped with the latest washing and sterilizing appliances. The bottles are purchased in Shanghai and the company claims to have a million on hand.

[The failure of a brewery in Hongkong was related in Daily Consular and Trade Reports for May 13.]

---

### A COMPLAINT FROM ROUMANIA.

[From American Minister John B. Jackson, Bucharest.]

The following incident shows the manner in which a sentiment prejudicial to American trade generally can be brought about by the ill-considered action of a single exporting house.

Some months ago an energetic American salesman representing a tool and hardware company came to Roumania and was successful in placing a number of orders. The local houses counted on receiving the goods ordered in accordance with the terms of the contract and made their arrangements accordingly. Recently—not long before the arrival of the goods had been anticipated—the agent here of the American house received a telegram to the effect that "freight charges make compliance with the contract impossible." Owing to the vigorous protest of the agent, the manufacturer has ultimately consented to send a part of the goods ordered, but these shipments will arrive late and the local houses will be subjected to considerable embarrassment and will be obliged to replenish their stocks from other sources, which will certainly not be American, and it is doubtful if they will ever again have confidence in representations made by an American salesman.

## GRADING PORCELAIN WARE.

[From Consul General Frank Dillingham, Coburg, Germany.]

The quality of a piece of modern porcelain is shown by its outward condition, and different classes of customers lay varying degrees of value on the outward appearance of the article, depending on their taste and their station in life. In Germany porcelain articles are sorted into four different grades—good wares, middle wares, fair wares, and poor wares. In grading porcelain, especially table ware, there is, besides these four classes, usually a fifth, known as "bruch," or breakage.

As articles coming under the first group are only the exceptionally fine, porcelain sold as being first grade is usually sorted so as to run from first to second grade. Purchasers and consumers now understand more about the different grades of porcelain than formerly and expect such a good quality even in the third grade that a higher class of excellence is scarcely possible. Consequently the term "third selection" is really generally understood in business circles as meaning a good or better grade of porcelain ware.

The fourth grade means about the same as defective ware, although this is a very good selling article for the tableware factories that supply the German home market, and, being of a somewhat better quality than usually comes under the heading "fourth class," could really be called a medium quality. The poorest assortment bears simply the name "breakage." Strictly speaking, this title is not applicable, for broken articles are not even salable. The characteristics of such breakage may be small, or sometimes larger, cracks in the rims or edges, out of shape or very yellow ware, pieces streaked or discolored with iron, etc.

**Export Ware—Cost of Manufacture.**

The manner of sorting china described is usual when supplying the home market, but wares intended for export are really the unsorted articles, just as they are taken from the kilns, after the removal of the poorest quality. Classification for the export trade is therefore the simplest.

Prices for the different grades can be found by following the general rule for sorting goods. The following calculation represents the cost of manufacturing 12 table plates, 25 centimeters (9.84 inches) in diameter:

	Cents.
Raw materials.....	8
Wages.....	6
Burning, including cost of work.....	16½
Expenses of management (40 per cent).....	12
	<hr/> 42½
Breakage in kiln.....	1½
Other breakage.....	4½
Loss in bad ware.....	2
	<hr/> 8
Total.....	50½

The cost price of a dozen unsorted plates would therefore be 50½ cents. Assuming that the factory manufactures a table plate that is up to the quality made by the average factory, 2 out of every 100

would probably come under class 1, 10 under class 2, 30 under class 3, and 58 pieces under class 4.

**Prices of Different Grades.**

Approximately the prices of the various qualities would be 50½ cents per dozen unsorted, equaling 4.2 cents per piece or \$4.20 per 100 pieces. This, divided into grades, would be as follows:

2 pieces, first quality, at 8.5 cents.....	\$0.17
10 pieces, second quality, at 6.2 cents.....	.62
30 pieces, third quality, at 4.75 cents.....	1.42
58 pieces, fourth quality, at 3.44 cents.....	1.99
Total.....	4.20

A profit or gain is not included in the prices of the plates, and must therefore be added to the foregoing figures.

### HANDBOOK FOR THE GERMAN EXPORT TRADE.

[By Commercial Agent Archibald J. Wolfe.]

The German Foreign Office has issued a handbook entitled *Handbuch für den Deutschen Aussenhandel* (Handbook for the German Export Trade). It outlines the activities in behalf of German commerce in which German consuls and other consular officials are permitted to engage and the services which they are expected to perform. The handbook contains nearly 400 pages and is divided into 10 sections; in the future it will be issued annually.

The German consular officers are expected to furnish information regarding sources of supply for raw materials and agricultural and industrial products of foreign countries, and to give opinions on the chances of selling German goods abroad. They supply the names of agents abroad and give information regarding the standing and trustworthiness of foreign customers, the state of foreign markets, and general economic conditions.

Persons making inquiries of consuls regarding prospects for German goods are urged to be concise, but to give all details. A model letter of inquiry is given. It is urged not to send inquiries of a similar nature to several consulates in the same country. The inquirer is expected to reimburse the consul for actual outlay. When this is not done the consul is paid from a fund kept for the purpose by the chambers of commerce in Germany. All the chambers of commerce but two keep such a fund; not more than 30 to 50 marks are paid out for any one case.

The German consular service maintains commercial attachés in a number of foreign cities. These are officials permanently stationed at their posts and devoting their time exclusively to the care of German commerce in their districts. There are also a number of agricultural attachés.

Considerable space is devoted to special information relating to the practice of each consulate in dealing with inquiries for credit reports, collections, and requests for agencies, and attention is given to costs of litigation, credits, etc. Two sections are devoted to tariff matters. There are lists of German consulates and of the consulates to which are attached the commercial and agricultural experts. There is also a list of the commercial and agricultural organizations in Germany.

**COMMERCIAL VALUE OF A LANGUAGE.**

[From Consul P. Emerson Taylor, Stavanger, Norway.]

Practically all the letters sent by American exporters to Stavanger importing firms are written in English. This consulate is frequently called upon to assist in interpreting some of the correspondence; and in this way, as well as by direct correspondence between American firms and the consulate itself, it is noticed that the letters of American exporters quite frequently contain the following statement and similar ones: "We must insist that your reply to our letter be in the English language, as this firm has no facilities for translating letters from the Norwegian to the English language."

The American firms have invariably been informed that, while the larger importing firms of the district have English correspondents, the smaller houses do not, and that correspondence with both classes will undoubtedly receive more prompt and careful consideration if the American writer at least accords to the Norwegian the same courtesy he claims for himself, namely, the privilege of writing in his own language. While most importing merchants here read English fairly well, it is much more difficult for them to write it. It may not in all cases be practicable for American firms to secure translations of the Norwegian letters; but those American firms which are considerate enough either to leave to the prospective purchaser the matter of the language to be used in the reply or to indicate that a reply in either English or Norwegian will be acceptable are the firms whose business letters are receiving the most attention and bringing them the most business. The small amount of money thus necessarily expended in securing the translation of letters will be more than made up in the saving of correspondence from which no results whatever are obtained.

**Catalogues in English a Waste of Money.**

The same is to some extent true of circulars and catalogues. Of the scores of catalogues received at this consulate monthly not one in a hundred is in the Norwegian-Danish language. The result is that few of them are ever consulted in the consular files. This consulate more than a year ago began loaning and delivering catalogues by messenger to the leading importers, and some orders for American goods have been secured in consequence; but notwithstanding the consulate informs the recipient upon delivering the catalogues of its willingness to aid in the translation of language and prices as to any goods in which the firm may be interested, there have been comparatively few requests of this kind.

Of course the publication of entire catalogues in Norwegian is in most cases impracticable and inadvisable because of the limited market of the two countries using the language; but certainly much better results would be obtained if firms endeavoring to secure business here by correspondence would first ascertain which particular kinds of the goods they handle would be best adapted to and most in demand in this market and then send merely a pamphlet or leaflet in the Norwegian language limited to descriptions, prices, and illustrations of such goods.

The present system of sending large and comprehensive catalogues in English, many of them expensively and elaborately prepared for English readers, is a tremendous waste of time, material, and postage.

They are strange, confusing, and bewildering to the average Scandinavian buyer, and, with his meager knowledge of English, he seldom takes the time and trouble to find the particular goods he wants. A small leaflet in his own language, treating only of the class of goods in which he is especially interested and illustrated with some of the cuts from the large catalogue, will, at one-tenth the expense of the large English catalogue, accomplish more.

#### **Pamphlets in the Norwegian Tongue.**

The consulate has endeavored to devise some way of interesting local buyers in the English catalogues filed in the office, but the plan of loaning them to merchants and importers seems to be bringing better results than any other tried. It enables the consular employee to point out to the dealer the articles shown in the catalogue which are believed to be of the kind he may want, and to assure him personally of a willingness to aid him in securing any information he may desire, both as to the contents of that particular catalogue and as to American goods in general. Results from this method have been encouraging.

It is believed, however, that for those American firms whose business is not such as would warrant the publication of a special catalogue for Norway and Denmark the adoption of a Norwegian-Danish loose-leaf or pamphlet plan of supplementing correspondence is the best business-getting substitute for the visit of the traveling salesman, which for most American exporters is impracticable in Scandinavia.

---

### **MANGANESE ORE IN WEST INDIES.**

[From Consul F. T. F. Dumont, Base Terre, Guadeloupe, French West Indies.]

In the exhaustive 300-page Bulletin 427 issued by the United States Geological Survey on "Manganese Deposits of the United States, with sections on Foreign Deposits, Chemistry and Uses," the following statement appears:

A bed of manganese ore of superior quality is reported from the island of St. Martin in the West Indies, and another deposit has recently been found in Haiti.

Mining geologists having made inquiry about the St. Martin deposit the following statement has been secured from its owner:

This deposit is at Cay Bay in the Dutch part of the island, not far from this town of Philipsburg and quite near the sea. Some 10 or 12 years ago two shipments of manganese were made from this place to New York and sold readily, the analysis showing about 44 or 45 per cent manganese. Not long ago the deposit was visited by a Dutch Government engineer, whose opinion of the same was quite favorable. Though there are outcrops of manganese in various parts of the island, Cay Bay is the only place from which ore suitable for shipping has been obtained.

---

### **Bound Volumes of Daily Consular and Trade Reports.**

The Government Printing Office will supply regularly in quarterly volumes, with complete 32-page indexes, bound sets of Daily Consular and Trade Reports from January 1, 1912. The price is \$1.50 per volume or \$6 per year, in order to cover the cost of the index and binding. Those desiring the bound volumes should write to the Superintendent of Documents, Government Printing Office, Washington, D. C.

---

*The Khedivial Agricultural Society of Egypt* is arranging to import extensively commercial fertilizers, for which \$500,000 has been advanced to it by the National Bank of Egypt.

**COST OF LIVING IN A SPANISH CITY.**

[From Vice Consul Harris N. Cookingham, Seville.]

Not only the native Spaniards in Seville, but also the foreign residents, are confronted by the high cost of living here. Local conditions are peculiar and a foreigner is inclined to feel that luxuries are sometimes cheap and necessities invariably expensive.

Competition among the wage earners of Seville is great enough to keep wages at a minimum; wharf laborers, for example, receive from \$0.36 up a day for handling cargo, while tram guards and motormen receive \$0.54 and up. Bank clerks receive from \$12 a month up. With such earnings the poorer working people are unable to afford much that those in similar employment in the United States regard as indispensable, and local living conditions are for the most part somewhat primitive. The houses seldom have adequate sanitary arrangements, and even the homes of the well-to-do often lack modern bathrooms.

**Housekeeping Costs—Clothing—Luxuries and Travel.**

A good house, well situated, fitted with a bathroom, rents for \$60 a month and up, while an apartment of seven small rooms and bath may be had for \$22.50. Apartments seem to be gaining in popularity, but those in Seville have neither provision for heating in winter nor the other advantages which make American apartments comfortable. House furnishings are, as a rule, expensive when compared with similar articles in the United States, with the exception of wicker furniture and matting rugs, which are made in Seville. A wicker chair costs only \$1.44 and good matting rugs, 3 by 6 feet, from \$0.54 up. Other housekeeping expenses are not excessive. Gas, which is coming into use for cooking and illumination, costs \$0.03 per cubic meter (35.314 cubic feet); electric light costs \$0.18 a kilowatt with discounts, and the water tax averages \$0.90 a month. Servants' wages range upward from \$3.60 a month and board, and it is usually necessary for the most modest household to keep more than one.

The prices of clothing and other personal effects average higher than in the United States. The high duty on woolen cloths, most of which come from England, make woolen suits of good quality expensive, although the price is modified by the low cost of labor for tailoring.

It is interesting to note in comparison the current prices for non-essentials in which Americans at home indulge. Popular amusements cost 4 cents to 42 cents, rarely higher except in the grand opera season. Flowers range from 1 cent for a jasmine or violet boutonniere to 18 cents a dozen for midwinter roses. A good carriage can be hired for 45 cents an hour and tram fares range from 2 to 8 cents, according to distance. Tickets for a 100-mile railway journey, first class (which is often inferior to the ordinary American day coach) bring the mileage cost to 3.6 cents, while a 1,242-mile ticket good for 3 months reduces the cost per mile to 2.4 cents.

**Cost of Food.**

In considering the cost of food in Seville, the prices must always be compared with the daily earnings of the working people, which are insufficient to allow them many of the articles of food which the American laborer deems necessities. In fact, the laboring class subsists largely upon vegetables, bread, and a little fish (most frequently dried cod). Their typical dish is a broth of chick-peas, rice,

and a few other similar ingredients, including, in their seasons, Spanish sweet peppers, squash, tomatoes, and beans. Fortunately vegetables are inexpensive and are the food of the laboring class.

The prices of some of the common foodstuffs, as purchased in the retail market, are given in the following table, the quantities being 1 kilo (2.2 pounds) unless otherwise stated:

Articles.	Price.	Articles.	Price.
Butter, domestic.....	\$0.63.	Peaches.....	\$0.09.
Cheese, cream.....	.54.	Lard.....	.40.
Chocolate.....	1.19.	Milk, per quart.....	.11.
Coffee.....	.90 up.	Beef.....	.54.
Eggs, per dozen.....	.27 up.	Fowls, small, each.....	.72 up.
Flour.....	.11 up.	Ham.....	.72 to 1.98.
Clams.....	.14.	Olive oil.....	.28.
Dried codfish.....	.23.	Salt, table.....	.04.
Sardines.....	.18 up.	Sugar.....	.21.
Shrimps, per dozen.....	.27.	Wine, table.....	.18 up.
Apples.....	.06 up.	Beans.....	.11 to .26.
Bananas, per dozen.....	.18 up.	Cabbage.....	.05.
Cantaloupe, each.....	.09.	Potatoes.....	.03.
Dates, dried.....	.45.	Rice.....	.10.
Figs, dried.....	.14.	Tomatoes.....	.02 to .18.
Oranges, per 100.....	.72.	Sweet peppers.....	.09 up.

Canned foods are not widely used in Seville and such few canned fruits and fish as are found here are beyond the means of the average consumer. American catsup is 45 cents a bottle and English jellies 36 cents a jar.

### MANCHURIAN NOTES.

[From Consul General Lester Maynard, Harbin.]

#### River Navigation—Pawn Shop.

Navigation opened on the Sungari River at Harbin on Sunday, April 14, the first steamer coming alongside to take cargo on that day.

The Joint-Stock Company for Storage and Mortgaging of Movable Property at Harbin, capital \$25,000, has been organized to establish a lombard (pawn shop).

#### Australian Wheat in Manchuria.

Samples of the Australian wheat purchased by the Russo-Flour Milling Co. for its mill at Vladivostok, as reported in Daily Consular and Trade Reports for March 12, have been received at Harbin and have considerably interested the Chinese farmers, due to the excellent appearance of the grain, which is large, round, light-yellow in color, and uniform in size, being unmixed; and it is believed that orders will be sent to Australia for seed. The cost of the wheat delivered at the mill was \$35.97 per ton of 2,000 pounds. The average price of Manchurian wheat in Harbin during 1911 was only \$19.40 per ton of 2,000 pounds, but the necessity of importing at such a high price may be partially accounted for by the fact that the Australian wheat is of better quality than the best Manchurian wheat, but is principally due to the shortage of the Manchurian wheat crop on account of floods and also of the heavy calls made on the wheat stores by the famine in western Siberia and the unusually large requirements for the Amur Railway. Had the stocks of Manchurian wheat been drawn upon for the Vladivostok mills, the supply would soon have been exhausted, or the price forced to a prohibitive point, and in either case the mills at both Harbin and Vladivostok would have been shut down had not foreign wheat been imported.

**FIRE PROTECTION OF AN ITALIAN CITY.**

[From Consul Hernando de Soto, Palermo.]

The fire-fighting force of the city of Palermo, which is maintained by the municipality, consists of 1 chief, 1 assistant chief, 4 adjutants, 8 sergeants, 12 corporals, and 73 men, who receive the following annual salaries during the first six years: Chief, \$772; assistant chief, \$482; adjutants, \$357; sergeants, \$300; corporals, \$260; men, \$166. The officers then are raised to \$868, \$579, \$386, \$328, and \$290, respectively, and after 12 years' service receive further increases of salary to \$965, \$675, \$405, \$347, and \$318, respectively.

In addition to the foregoing regular salaries there are certain extra allowances for clothing and board, and to those officers who also act as paymaster and auditor, assistant accountant, chief engineer, and assistant engineer. A pension is granted after 25 years of regular service, beginning at five-eighths and gradually increasing to a maximum of four-fifths of the last salary received. This maximum is usually reached after 37 years of service. Two and one-half per cent is retained out of the regular salaries for pension purposes by the municipality.

Assistance rendered by the Palermo fire brigade to communities outside the city limits are charged for at fixed rates, and engines and other apparatus may be loaned by the department at stipulated prices. For special watch service, in theaters, concert halls, public balls, meetings, and the like, fees are charged, but the money so received represents a personal compensation which each man may retain for his own use. Excluding extraordinary and unforeseen expenses, the cost of the fire department aggregates \$28,000 per annum—\$23,800 for salaries, \$2,100 for maintenance and repair of engines and implements, and \$2,100 for maintenance of premises and miscellaneous expenditures.

**Equipment—Water Supply.**

The equipment consists of:

One automobile for first help, of Italian make, type "Lancia," 25 horsepower. Principal pieces of equipment—ladder in 4 sections, 2 chemical extinguishers, tools, 300 meters (984 feet) of hose. Cost of the automobile, \$2,300.

One automobile fire engine of French make; motor of Dietrich type and pump constructed by Drouville Frères, Nancy; 4 cylinders, 40 horsepower. Pieces of equipment—2 hook ladders, 2 chemical extinguishers, rope, tools, 980 feet of hose, 50 torches, 3 safety lamps; cost, \$5,400.

Two steam fire engines, French make, A. Thirion Fils, Paris; 2 cylinders, 6 horsepower; cost, \$1,650 each.

Three extension ladders, height 82 feet, one revolving, of German make (system Schmal); and two fixed, of Italian make (Paolo Porta, Milan).

Two 4-wheel horse vehicles for first help, equipped with hand pump, ladder, hooks, tools, hose, etc.

Two 2-wheel horse-drawn vehicles for first help, equipment similar to the foregoing.

Eight hand pumps, French make, each 590 feet of hose; 6 hand pumps, German make, each 590 feet of hose; 1 hand pump, Italian make, 590 feet of hose; 2 hose carts with 984 feet of hose each; 1 air pump feeding 6 air tubes, this apparatus being particularly adapted for fires in sulphur mines, which occur frequently; 22 bicycles; 1 handcart with 4 chemical extinguishers. Total length of hose, 16,404 feet.

The above apparatus is at the central station. The other three stations in Palermo are equipped each with 1 hand pump and 1 hose cart.

There are 835 hydrants in Palermo of 45 millimeters (1.77 inches) diameter and 6 of 70 millimeters (2.655 inches) diameter. The

pressure is 3 to 6 atmospheres, by which water can be thrown to a maximum height of 196 feet.

#### Heating and Cooking Methods—Fire Statistics.

The city of Palermo has 360,000 inhabitants. The houses do not exceed four stories in height, the larger percentage having only two stories. They are all built of stone, including staircases and floors in all the flats. On account of the mild climate, the temperature seldom dropping as low as 40° F. during a few weeks in January, heating is almost unknown; and with the exception of the hotels, the opera house, and a few private residences, provided with steam heating appliances, not one building has a chimney. Cooking is usually done on gas or petroleum ranges, or in the old-fashioned Sicilian way by means of charcoal placed in small, square holes on the hearth and fanned into a blaze.

Fires destroying a whole block are entirely unknown, and it seldom occurs that an entire house burns to the ground. Fires are usually confined to the room or floor in which they originate. During the three years from 1908 to 1910 there were 338 fires in Palermo and 28 in neighboring communities, entailing a total loss of \$90,000. Of these, only 48 were of a comparatively serious character, 78 of medium importance, and 212 insignificant.

### ORE SHIPMENTS FROM GERMAN SOUTHWEST AFRICA.

[From Ambassador John G. A. Leishman, Berlin, Germany.]

The following statement of the movement of ores from German Southwest Africa was prepared by the Imperial Colonial Office:

Countries.	Ores.			Lead, raw, in bars, or rolled.
	Raw copper.	Concentrated copper.	Other.	
1910.				
United States.....	<i>Pounds.</i> 24,091,211	<i>Pounds.</i> 5,596,984	<i>Pounds.</i>	<i>Pounds.</i> 534,356
Belgium.....	50,153,846			1,397,157
Cape Colony.....			190	
Germany.....	3,633,610	1,149	45,717	3,854,391
United Kingdom.....			130	
Total.....	77,878,667	5,596,133	46,037	5,785,904
1911. <sup>1</sup>				
United States.....	7,755,266	873,030		
Belgium.....	36,382,277	552,567	19,850	1,550,598
Cape Colony.....	273		121	
Germany.....	1,822,156		18,603	
United Kingdom.....	176		24,101	
Total.....	45,960,148	1,425,607	62,675	1,550,598

<sup>1</sup> These figures are for the 9 months from Jan. 1 to Sept. 30.

Practically all of the foregoing shipments were made via Swakopmund.

As supplementary to the above information, Consul General Richard Guenther, of Cape Town, British South Africa, reports: "The shipments of the working mines of the Otavi Mines & Railroad Co. amounted, from April 1, 1910, to March 31, 1911, to 40,400 tons. Of this amount, Tsumeb contributed 36,000 tons, and the mines in the Otavi Valley (Asis, Guchah, and Great Otavi) the remainder."

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8866. Men's shoes.**—An American manufacturing firm writes to the Bureau of Manufactures that one of its customers in a South American country has requested to be placed in communication with American manufacturers of men's shoes. Correspondence should be addressed to the firm making the inquiry as soon as possible.
- No. 8867. Fur skins.**—A leading furrier of east Germany informs an American consulate that he desires to hear from only the best and most reliable American exporters of raw and dressed lamb, sheep, skunk, and mink skins, who are in a position to furnish large quantities. He has had dealings with firms in the United States, and his request has particular reference to the reputation for solidity, fair dealing, and careful attention to the filling of orders, as he does not care to be put to the delay and expense of returning unsatisfactory goods. Correspondence may be in English.
- No. 8868. Upholstering material.**—An American consul in a European country reports that an agent in his district desires to establish connections with exporters of upholstering materials, such as Spanish moss and horse hair. He would also be interested in neat hides and leather. He wishes to sell on a commission basis and confine his activities to the taking of orders from domestic consumers, neither goods nor payments to pass through his hands. Correspondence should be in German, if possible.
- No. 8869. Can-making machinery and oil-mill equipment.**—American manufacturers of can-making machinery are requested to furnish catalogues, prices, with daily output and other estimates, for cans to be used in the preserved-pineapple industry. The specifications should be accompanied by a guaranty that the cans will be made air tight without the use of solder, if possible. The American consular officer submitting this report also states that catalogues and quotations are desired for a complete oil-mill plant capable of handling 1,680 pounds of copra per hour, with a guaranty of the extraction of 60 per cent of oil. The quotations should not include engines and boilers; in other words, the propelling power. It may be of interest to American firms to state in this connection that estimates have been furnished by an English concern for a plant handling 1,120 pounds per hour at a cost of about \$22,000 and by a German factory of plants handling 3,000 and 4,500 kilos (6,614 and 9,700 pounds) at \$7,400 and \$8,500, respectively.
- No. 8870. Hotel.**—The Bureau of Manufactures is in receipt of a communication in which the writer, who is connected with an American business house, states that while on a recent trip to Central America he discussed with a Government official the prospects for establishing hotels there. He was assured of the good will of the Government to assist some enterprising concern in putting up a modern and up-to-date hotel. In the opinion of the writer this project would prove profitable; further particulars can be obtained by addressing him on this subject.
- No. 8871. Marine and stationary motors.**—It is the intention of an organization under a foreign Government management to enter the field of selling motors, both marine and stationary, the idea being to establish selling agencies at various points in the country. Correspondence is desired with American firms manufacturing this type of motor with a view to securing the sole agency. To properly introduce the motors it would be desirable to have the first motor shipped on consignment in order to display the same. This machinery will have to be sold on time, and arrangements must be made whereby the manufacturer will accept part payment in cash, balance to be extended to a certain period. Correspondence and printed matter should preferably be in Russian, and should be addressed to an official whose name is furnished.
- No. 8872. Cottonseed oil.**—An American consul in the Near East reports that a firm in his district is desirous of securing the exclusive agency of a first-class American cottonseed-oil exporting house for a certain section of a country.

# DAILY CONSULAR AND TRADE REPORTS

ISSUED BY THE BUREAU OF MANUFACTURES, DEPARTMENT OF COMMERCE AND LABOR

15th Year

## USE OF SPRAYING MACHINES ABROAD.

### SPAIN.

[From Consul Robert Frazer, jr., Valencia.]

#### International Competition of Insecticides and Sprayers.

Under the auspices of the Ministry of Fomento (Agriculture, Public Works, etc.), an International Competition of Insecticides has been held in this orange-growing zone during the past 14 months and the awards of the jury of experts that directed the experiments have now been issued. Three money prizes (\$500, \$300, and \$200) were offered and four applications or sprayings were allowed to each competitor.

The principal object of the agricultural authorities who organized the competition was to discover, if possible, an efficacious and cheap remedy for citrus scale pests and to warn fruit growers against the employment of useless or harmful insecticides of unknown composition among the many that are offered for sale. The possibility of finding an alternative remedy to fumigations with hydrocyanic acid gas, the American method of destroying citrus scales, also entered into the scope of the competition. Exhaustive experiments recently conducted here in fumigation leave no doubt that it is a safe and positive remedy for every form of fruit scale, but the initial expense of purchasing the tents and other fumigation equipment has hitherto proved an obstacle to its immediate adoption in this district, where farms are usually very small and the benefits of cooperation are not yet fully appreciated.

The conditions of the competition required that each competitor should submit the formula and cost of the insecticide to be tested, and that the formulas of successful insecticides should be published for the benefit of the agricultural community. About 70 insecticides were entered for trial, but as one-half of them were of almost identical composition, with only slight variations in the proportions of the ingredients, many were eliminated and 34 insecticides were actually tested.

**Award of Prizes—Formulas.**

The first prize was not awarded because, in the opinion of the jury, none of the preparations experimented with proved to be a complete and positive remedy against all species of citrus scale. The second and third prizes were awarded to the following formulas (1 gram = 15.4 grains, or 0.035 ounce; 453 grams = 1 pound):

(1) Pine rosin, 1,600 grams; sodium carbonate, 800 grams; potassium chloride, 70 grains; clammy inula (*Inula viscosa*), a few cuttings of the plant, in infusion; 26 gallons of water. (2) Rosin, 2,000 grams; caustic soda of 78 strength, 500 grams; seal oil, 350 grams; rectified tar oil, 1 quart.

In preparing these insecticides for use, the soda is dissolved in hot water (1 gallon) and the rosin added so as to effect a complete blending of both. The mixture is then left to cool and the oil afterwards stirred into it producing a uniform emulsion sufficient for about 25 gallons of water.

**Resistance of Scale.**

The jury finds that these insecticides destroyed, without appreciable damage to the trees or fruit, both the red scale (*Chrysomphalus dictyospermi*) and long scale (*Mytilaspis gloveri*) more rapidly than the insect multiplied and that consequently it is only a question of perseverance in spraying to compass the complete extinction of these parasites. With regard, however, to the black scale (*Parlatoria ziziphi*), a species apparently unknown to American fruit growers, the most successful of the insecticide formulas experimented with failed to make an effective impression on the hard cuirass or shield covering the fully matured insect, which appears to be impervious to every treatment except hydrocyanic fumigation applied as strong as the tree will resist.

The competition brought into the experiment field a great variety of sprayers from the leading agricultural countries, including several characteristic American types with copies and imitations of them manufactured in Spain. The way in which these American sprayers are reproduced in almost every detail, both the large barrel and pump models and the handy wheelbarrow combinations for transporting sprayers through growing crops, seems to indicate that American manufacturers' rights are not protected by patents in this country.

**Spanish Preferences.**

The use of sprayers in this region is confined chiefly to orange trees and vines, and the conditions required in a successful sprayer are (1) extreme portability, (2) the blades of the agitator or mixer should work simultaneously with the ejecting mechanism so as to insure perfect uniformity of the strength and consistency of the insecticide, and (3) isolation, as far as practicable, of the acid mixtures that enter into the composition of most insecticides from the joints, lining, and valves of the sprayer. The larger farms and higher cost of labor in the United States create a demand for sprayers of 50 to 200 gallon capacity operated by horse or power traction, but there is no market here for such big sprayers. On the contrary, the very small farms, high rents, and cheap labor that characterize Valencia agriculture tend toward the suppression of roads, paths, and marginal divisions between crops and spaces at the ends of fields for turning or operating the simplest machinery.

In order to utilize every available inch of soil, even the irrigation distributing canals have their containing banks so pared away that they barely prevent leakage, and it is quite usual to see from 7 to 10 crops cultivated simultaneously on  $1\frac{1}{4}$  acres. Under such conditions it is not surprising that the favorite types of sprayers in demand here, and those to which the jury accorded the preference in the recent insecticide competition, are small 4-gallon sprayers of the Italian "Muratore" and French "Excelsior" pattern, which are carried on the back of the operator like a knapsack and secured in place by shoulder straps. The mixing and expelling power is usually compressed air or a small force pump. The Italian model modified and manufactured in Spain claims complete isolation of the corrosive-acid mixtures from all the interior live parts of its mechanism.

Cuttings from local catalogues forwarded [and obtainable from the Bureau of Manufactures] will give manufacturers a fairly accurate idea of the class of sprayers required on these markets.

#### SWEDEN.

[From Consul Stuart J. Fuller, Gottenborg.]

Sprayers are sold and used in Sweden to some extent, but not so generally or so widely as in the United States. More are used in the two southernmost counties, Malmohus and Kristianstad, the part of Sweden called Skane, than anywhere else. About one-half the cultivated area of the Kingdom is devoted to cereal crops, one-third to fodder plants, and one-tenth is allowed to lie fallow. The season for fruits and vegetables is short. It varies, the period of cultivation growing more restricted as one goes northward, until, in northern Sweden, laborers can be employed in farming for only about four months of the year.

##### Limited Culture of Fruit.

The cultivation of fruit trees can be carried on successfully only in the southern and central parts of the country. The fruits most generally cultivated are apples, pears, cherries, and plums. Apricots, peaches, and grapes can be grown only under glass. For small fruits, such as strawberries, raspberries, and currants, the climate in this consular district is especially favorable.

The use of sprayers in the country is restricted to fruit trees and berry bushes, except for a limited use in Malmohus and Kristianstad Counties of horse-drawn sprayers for weed killing. For root crops they are not used at all. The type most generally in use is the hand machine to be carried. There are very few hand machines with wheels and still fewer horse-drawn apparatus.

The hand machines are used for fruit trees and berry bushes. The principal use in connection with bushes is to combat the so-called "American gooseberry mildew." Single-horse machines are used to a limited extent in Malmohus and Kristianstad Counties in the spring grain to destroy the weed called navew (*Brassica campestris*).

##### Various Types of Machines.

The majority of the sprayers in use now are imported, though Swedish manufacturers have begun to turn them out in the last few years. The imports in 1910 were valued at \$2,502, of which Germany furnished \$1,855 worth, Denmark \$533, and the United States

\$91. Sixty per cent of the imports were at Malmo, 10 per cent at Helsingborg, and 10 per cent at Gothenburg, all in this consular district. Most of the imports from Denmark are believed to represent German machines transhipped at Copenhagen or shipped by ferry from stocks in the free port there to Malmo.

The great bulk of the imported sprayers in use are German, made by Carl Platz Maschinenfabrik, of Ludwigshafen, or by Gebrüder Holder, of Metzingen. The names of the best known German sprayers are Automax and Perfekt. Several American sprayers are sold and in use.

The Bill sprayer, made by Billmans Fabriks och Handels Aktiebolag, at Stockholm, is one of the best known Swedish machines. It is an automatic air-pressure device. Ystads Gjuteri och Mekaniska Verkstads Aktiebolag, of Ystad, has lately put a sprayer on the market. Another Swedish sprayer called Dugg is also offered. The automatic, such as Automax, Perfekt, and Bill seem to be more popular than the pump sprayers. The horse-drawn sprayers are apparently all German. A. Paulson, of Eslof, makes a specialty of these.

[A list of Swedish firms handling spraying apparatus may be had from the Bureau of Manufactures at Washington.]

#### MEXICO.

[From Consul William. W. Canada, Vera Cruz.]

The territory covered by this consular jurisdiction offers a field for introducing sprayers for destroying insects injurious to growers of fruit, both in the hot lands and in the more temperate localities in this district. The native has never troubled himself in trying to rid his plants or trees of these pests, of which there is an infinite variety in tropical climates. It will be remembered that some years ago nearly the entire north coast of Cuba was depleted of coconut trees, the insects attacking the leaves, adhering to the underside, and continuing their ravages until the tree was killed and nothing was left of it but a bare pole, blackened at the top. This was disastrous to the plantors; and it seems now that, if means had been at hand to spray these trees, they might have been saved at a comparatively small expense and these heavy losses prevented.

#### Foreigners Will Develop Fruit Growing.

For a number of years past Americans as well as Europeans have engaged in fruit raising in this district, which enterprise, however, is yet in an experimental stage. In the course of time matters will take a more definite shape, and fruit farms will be operated on a business basis, particularly so in localities where new routes of communication have been laid out and facilities for cheap transportation are available to reach the centers of population and the ports of shipment. While the fruit culture is in its present undeveloped state, little can be done in introducing hand or mechanical sprayers. Americans, Frenchmen, Italians, Spaniards, and Germans are the people that will develop this business, and they know all about spraying and the utility of it; in fact, there are those who use some homemade contrivance like a hand sprinkler or garden syringe to which a spraying nozzle has been attached. Small hand-spraying pumps may be found at all hardware stores, made out of brass tubing. As these imple-

ments are also used for many other purposes, it would prove to be a difficult matter to determine the quantity sold simply for spraying fruit trees.

During the present conditions in Mexico, which have made themselves felt in this consular district to a great extent, very little can be done in the line of introducing sprayers or any other innovation of comparatively unknown implements. Later the entire district should be canvassed with a view of determining the needs of the planters. Aside from fruits there are also coffee trees that suffer from a microbe that attacks the leaves, and tobacco plants need careful watching, for they have their enemies as well.

It has been found that while catalogues and circulars may have their uses, as sellers they amount to very little until a business connection has been made. A personal canvass of the entire district by a competent person will surely result in a good business when the proper time arrives.

---

#### GREECE.

[From Consul A. B. Cooke, Patras.]

##### **Sprayers for Currant Vineyards.**

The large number of sprayers used here are almost entirely for spraying grape and currant vines. Those mostly in use are either imported from France and Italy, or imitations of the foreign make manufactured locally by hand. [The names of local makers of sprayers may be had from the Bureau of Manufactures, Washington, D. C.] Some American sprayers have been introduced and are reported to render good service.

The sprayer used is a metal affair holding about 3 gallons of water, carried on the back of the operator. The operator works a lever as he walks about the vines driving the spray by air pressure through a small hose and nozzle upon the vines. The spray is a 2 per cent solution of sulphate copper.

For other crops, including citrus fruits and olives, no spraying seems to be done here. There appears to be no law in Greece by which foreign patents can be protected against imitation.

---

#### TRINIDAD ISLAND NOTES.

[From Consul Franklin D. Hale, Port of Spain.]

*Wireless.*—Trinidad, which was the first West India island to test wireless telegraphy, is now to have a larger plant at Port of Spain, which will have a maximum radius of 2,000 miles.

*Cacao.*—Trinidad exports to the United States for the first three months of 1912 aggregated \$1,871,806, an increase of \$293,369 over the same period of 1911. Of the total, \$1,681,270 represented cacao. This season's cacao production, however, is materially affected by the long drought, and the June pickings will be almost nothing.

*Coconuts.*—Citizens from Port of Spain are scientifically planting a large coconut estate in Tobago. After the growth on the land is cut and burned stump pullers are used. The first machine bought in the United States worked so satisfactorily that more have been ordered. The natives are surprised at the results of the operations. If improved methods could be applied to all coconut estates in Trinidad, increased production would be marked.

**ARGENTINE ALLIANCE FOR ECONOMIC PROGRESS.***[From Consul General R. M. Bartleman, Buenos Aires.]*

An institution known as the Museo Social Argentino has been organized in this city, with offices at Avenida de Mayo No. 695. Its object is to promote the social progress of this country in all the phases of its development. These objects will be realized by—

(a) Establishing a library and bureau of archives and a collection of objects with a view to the exchange of national and international information regarding the same; (b) publications regarding the activity of the institute and results of its investigations; (c) the initiation of social improvement work; (d) studying and investigating allied conditions existing in Argentina and elsewhere; (e) the organization of lecture courses and a gratuitous consultation bureau; (f) creation of college and university chairs on subjects covered by the objects of the society.

The consultation commission will be divided into four sections at first (1) for the study of city problems, (2) for the study of rural problems, (3) for legislation, and (4) for propaganda. Later other sections will be formed to meet other conditions as they may arise. For the dissemination of the information acquired through its activities and studies the institute will publish a monthly bulletin for circulation at home and abroad.

The Museo Social Argentino will be in effect a federation of the various Argentine economic organizations. The following is a list of the societies here which have already agreed to cooperate with it:

Facultad de Agronomía y Veterinaria, La Plata.  
Facultad de Agronomía y Veterinaria, Buenos Aires.  
Facultad de Derecho y Ciencias Sociales, Córdoba.  
Facultad de Ciencias Físicas, Matemáticas y Astronómicas, La Plata.  
Facultad de Derecho y Ciencias Sociales, Buenos Aires.  
Facultad de Ciencias Exactas, Físicas y Naturales, Buenos Aires.  
Federación Universitaria de Buenos Aires.  
Asociación "El Magisterio."  
Centro Estudiantes de Arquitectura.  
Instituto Nacional del Profesorado Secundario.  
Círculo Médico Argentino y Centro Estudiantes de Medicina.  
Biblioteca de la Facultad de Ciencias Médicas de Buenos Aires.  
Sociedad Científica Argentina.  
Sociedad Central de Arquitectos.  
Central Nacional de Ingenieros.  
Centro de Estudios "Rivadavia."  
Sociedad de Higiene Pública é Ingeniería Sanitaria.

Círculo de la Prensa.  
Asociación Universitarias Argentinas.  
Centro Estudiantes de Ingeniería.  
Dirección General de Salubridad de la Provincia de Buenos Aires.  
Asociación Belga de Fotografía.  
Liga popular contra la Tuberculosis.  
Sociedad Protectora de la Infancia.  
La Sanitaria Argentina.  
Sociedad Rural Argentina.  
Sociedad Anónima "La Martona."  
Municipalidad de Luján.  
Cruz Roja Argentina (Argentine Red Cross).  
Club de Gimnasia y Esgrima.  
Cooperativa Nacional de Consumos.  
Sociedad Rural de la Pampa.  
La Semana Comercial.  
Aero Club Argentine.  
Unión Industrial Argentina.  
Club del Progreso.  
Sociedad Sportiva Argentina.  
La Noticia.

Among the active members of this society are four cabinet ministers, the mayor of Buenos Aires, university professors, national and provincial legislators, and a number of distinguished people who have achieved success in business and intellectual pursuits.

**Intercourse Sought with Associations in the United States.**

The Museo Social Argentino has expressed a desire to this consulate general to be placed in touch with the most important societies and organizations analogous and similar to their own existing in the United States; this with a view to exchanging information, correspondence and publications, etc. I, therefore, urge that boards of trade, chambers of commerce, educational institutions, cooperative, legal, architectural, philanthropic, charitable, scientific, art, musical, commercial, financial, physical culture, press, natural history, patriotic, civic, sociological, educational, agricultural, penological, engineering, medical, and similar societies and institutions in the United States take cognizance of this fact and avail themselves of the oppor-

tunity presented. This will no doubt augment the promotion of trade and the better mutual understanding between this country and our own.

However, in writing and sending publications to this country, I would again caution the interested parties to affix the proper postage and thus avoid the creation of a prejudice against American institutions. The short-postage question is a common fault among our countrymen and is not confined to any one class of individuals; even publishing houses and educational institutions have proved delinquent in this respect in mail addressed to the Buenos Aires consulate.

### ENGLISH WORSTED SPINNING AT DONCASTER.

[From Consul Augustus E. Ingram, Bradford.]

A recent occurrence of interest to this district is the moving of the Anderton firm of worsted spinners from Cleckheaton to Doncaster. As stated in a recent consular report, the development of the new coal area in Doncaster has brought a large number of people into that district, and a local newspaper, commenting on this new enterprise, says:

As manufacturers always tend to locate in proximity to the coal beds, factories will spring up in the district in all directions. Land is still fairly cheap, although rising in value owing to the coal boom, and local prices are low. There is no part of Yorkshire which now offers so many advantages to the capitalist for sites for establishing industries.

A few years ago a cigar factory left Bradford for Doncaster, but this moving of a textile establishment has aroused especial interest, and the question is asked, Is Doncaster destined to become a center of the textile trade?

The primary reason for moving this spinning mill is the shortage of labor—particularly girl labor—in the old centers of the trade. It has been claimed, and indeed is a theory tenaciously held in textile districts, that the degree of skill which modern conditions demand can only be obtained in the process of years—that the operative with the required subtlety of touch is the product of two or three generations; but the owners of this firm claim that "well-educated girls and boys can be taught to spin quite easily if those who undertake to teach them have the requisite knowledge." Another fact which has to some extent influenced the firm is that in Doncaster the canal facilities will place them within easier access of the seaport.

The new mill is a two-story building, well lighted and ventilated and fireproof throughout, the principal material being molded bricks, with concrete floors covered with rock asphalt. The latest ideas have been adopted in regard to transmission of power. The shafting is designed to run at high speed and is connected to the frames by half-twist belt drives. The engine is of the inverted vertical compound type, using superheated steam, and is capable of developing 550 horsepower.

*Defective cotton baling.*—Consul Felix S. S. Johnson, of Kingston, reports that his attention has been directed to the bad condition in which bales of American raw cotton arrive at that Canadian port, the canvas on the bales shown him being of poor quality, easily torn, and most of the iron hoops being broken.

## AMERICAN PURCHASES FROM BELGIUM.

[By Consul General Ethelbert Watts, Brussels.]

American purchases from Belgium last year decreased in value over \$200,000 compared with 1910. The merchandise invoiced through the American consulates at Antwerp, Brussels, Ghent, and Liege was valued at \$37,894,351, against \$38,106,590 for 1910. The principal articles contributing to the loss were preserved vegetables, woolen textiles, antimony, arsenic, chemicals, chicory roots, copper, cut diamonds, plate and window glass, horns, iron and steel, ivory, linen goods, and meat extract.

The principal item in the exports to the United States is cut diamonds, which amounted to \$10,009,324, a decrease of \$52,520 compared with 1910. There was an increase of \$552,956 in the value of rough diamonds exported. Another item of considerable importance was rubber, shipments of which amounted to \$6,322,633, a gain of \$1,467,952 over 1910.

## Exports to United States.

The following table gives the value of the articles invoiced through the American consulates in Belgium to the United States for 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Aluminum.....	\$19,008	\$23,540	Ivory.....	\$595,652	\$450,716

Iron.....	230,163	120,640			

**Shipments to Philippine Islands and Porto Rico.**

There was also a decrease of over \$45,425 in the value of the shipments to the Philippines, but an increase of nearly \$24,000 in those to Porto Rico. The principal exports to the American insular possessions were iron and steel, fertilizers, cotton goods, glassware, hardware, woolen goods, and matches. The following table shows the exports and their values for 1910 and 1911 to the Philippines and Porto Rico; there were no articles invoiced to Hawaii:

Articles.	1910	1911	Articles.	1910	1911
<b>TO PHILIPPINE ISLANDS.</b>			<b>TO PHILIPPINE ISLANDS—cont.</b>		
Canned goods, etc.....	\$17,904	\$14,922	Yarn, cotton.....	\$6,071	\$5,378

**WEST AFRICAN NOTES.**

[From Consul W. J. Yerby, Freetown, Sierra Leone.]

**Radiotelegraphic School at Dakar.**

M. Clozel, the acting governor general of French West Africa, has just established at the radiotelegraphic station at Dakar a school of instruction, in order that military telegraphists sent for service to French West Africa may complete their knowledge.

**Ivory Coast Rubber Prospects.**

Quoting from an official report recently issued on rubber cultivation in the Ivory Coast, French West Africa, the *Quinzaine Coloniale* (Paris) of February 25 states:

The production of wild rubber in that colony is, generally speaking, carried on satisfactorily, except for a certain amount of adulteration. Large tracts of *Funtumia* rubber trees, which have as yet scarcely been touched, still exist in the western half of the colony. In the east the forests have been more depleted, but the deficiency thereby caused can be made up by replanting trees. Great progress is being made with rubber plantations, for which a large part of the Ivory Coast is suitable. The *Hevea* and *Funtumia* are easy to grow and give good results. The great difficulty which is usually encountered in procuring labor in this part of Africa is also disappearing with the opening up of new routes to the Sudan.

**AMERICAN LOCOMOTIVES IN FORMOSA.**

[From Consul Samuel C. Reat, Tamsui.]

The Railway Department of the Formosan Government on March 30 ordered three passenger locomotives (the Pacific type) from the American Locomotive Works, Schenectady, N. Y. The contract involves approximately \$62,500, including duty. The Japanese house of Mitsui Bussan Kaisha signed the contract for the American firm, which also had a representative here during the negotiation. [The purchase of Ohio locomotives for another Formosan railroad was noted in *Daily Consular and Trade Reports* for May 17.]

**PUBLIC HYGIENE IN GERMANY.**

[From Consul General A. M. Thackara, Berlin.]

The water supply of the city of Berlin comes in most part from wells situated in the immediate vicinity of the Tegelsee, a lake near the junction of the Rivers Spree and Havel at Spandau, and from the Muggelsee, a lake on the southeastern outskirts of the city, through which the River Spree flows.

The water is drawn from wells formed by sinking steel or wrought-iron pipes through the sand strata down to a stratum of clay of about 60 meters (197 feet) thickness, which forms the water sole of the valley. The wells vary in depth from 40 to 70 meters (131 to 230 feet). The diameter of the pipes at the Tegel works is 152 millimeters (6 inches), and at the Muggel works 230 millimeters (9 inches). At the latter plant, however, the 230 millimeters wrought-iron "mantle" pipe incloses a pipe 150 millimeters in diameter, also of wrought iron. To the lower end of the inner pipe is joined a galvanized perforated filter pipe of the same diameter and about 13 meters (42.7 feet) long. A copper-wire screen covers this filter pipe. By forced pumping the fine sand and slime are removed from the immediate vicinity of the screen, so that the remaining coarse gravel and sand form a natural filter.

The area over which the wells at Muggelsee are dug measures 25 meters (82 feet) wide and 9 kilometers (5.6 miles) long. The wells are in three galleries, 2,740, 4,600, and 2,200 meters (8,989, 15,092, and 7,218 feet) long, respectively. Eight to eleven wells are joined in one group and connected by a siphon to a central well, whence the water is pumped directly to the iron-removing plants (Enteisungsanlagen).

**Sewage Disposal—Dairies.**

In the two sections of the works at Tegelsee there are in all 118 wells, having a maximum capacity of about 90,000 cubic meters (23,775,300 gallons) daily output, while in the three well sections or galleries at Muggelsee there are 350 wells with a maximum daily capacity of about 190,000 cubic meters (50,192,300 gallons).

The sewage disposal of Berlin is admirable. None of the sewage is permitted to be discharged into the river or canals which pass through the city. It is all pumped through large pipes to the city sewage farms (Rieselfelder) located within a few miles to the north and south of Berlin. The sewage farms have an area of approximately 40,000 acres. About 6,200 acres are leased in small holdings to farmers, the remainder being cultivated by the municipal authorities. While the city administration supervises the cleaning of the streets, the disposal of the sweepings is let by contract. Some of the contractors have purchased barren and unproductive land for dumping purposes, the refuse being exceedingly valuable as a fertilizer.

There are no municipal dairy or milk stations in Berlin. There are several hundred milk dealers, one of whom has a dairy which covers nearly 28,300 square meters (304,621 square feet), almost half of which area is taken up by buildings. About 2,500 hands are employed, and several hundred wagons distribute the daily output of 120,000 liters (31,700 gallons) of milk. Of this amount only a few hundred liters are sterilized; most of the balance is pasteurized by a special process. It is said that 75,000 families are supplied by this

dairy, and that the number of bacteriological and other analyses made by this firm in the course of a year is 50,000. The state of health of the cows is controlled by four certified veterinary surgeons, and telegraphic information is sent to the Berlin headquarters upon the outbreak of any disease.

#### **Food Analysis.**

Special stress is laid on the prevention of tuberculosis. The cattle, most of which are of Simmenthal and Jeverland breeds, undergo a thorough clinical examination including the tuberculosis test, and repeated inoculations with tuberculin at intervals of five months and weekly veterinary inspections are made. All calves raised for breeding purposes are rendered immune by the Behring process.

Bottles are filled by siphoning, and tin receptacles, bottles, etc., are sterilized. The whole farm is fenced in and the stables are small and independent of one another. The laws of Berlin do not require the pasteurization of milk at present, but a new enactment on the subject is now being drafted. Milk sold in Berlin is required to have 2.8 to 3 per cent butter fat; cream must contain 10 times this amount, that is, 20 to 30 per cent. The number of bacteria in milk is not counted; it is estimated at the agricultural experimental stations in the various provinces.

The laws of Berlin provide for the inspection of dairies, and the provincial towns have similar regulations. In some communities a medical or veterinary inspector is maintained, who examines samples of the milk, and the results of the analyses made by him are published from time to time. In Berlin, the city institute for the examination of foodstuffs (Städtisches Nahrungsmittel Untersuchungsamt) is in charge of the administration of the food laws. It is directly under the control of the police. The institute makes chemical, microscopic, bacteriologic, photochemical, and other analyses of foods, etc. It works in conjunction with the sanitary, medical, and criminal police departments. Persons suffering from the ill effects of foodstuffs are at liberty to apply to the police, who will have an examination of the suspected food made free of charge. The annual expenses of the institute amount to about \$11,900.

#### **Tuberculosis Hospitals.**

No municipal tuberculosis hospital is maintained, but there is a sanitarium for tubercular diseases at Beelitz in der Mark near Berlin, and stations are maintained in the city at which phthisis sufferers may obtain advice and assistance. These latter institutions look out primarily for the prevention of tuberculosis. Between 1904 and 1907 about 35,000 persons received attention at these institutions, 18,500 bad dwellings were improved hygienically, and many persons assigned to sanitariums.

The hospital for consumptives at Beelitz is not a Berlin institution. Its current expenses are met out of the national insurance fund, it having been erected in compliance with the imperial invalidity law. The hospital consists of two parts, one for the treatment of consumption and one a sanitarium. In 1906 the expenses were about \$349,900. More than 4,000 patients received treatment in that year, of which about 3,600 were new cases.

Ventilation for the hospital is obtained by means of ventilators fed from underground air ducts constructed of glazed tile. In the con-

sumptives' quarters the fresh air is first warmed in special chambers and moistened with steam. Rabitz collectors dispose of the stale air, which is led to chimneys where hot-air currents create a sufficient draft to exhaust it.

#### **Other Health Measures—Municipal Abattoir.**

Cholera, plague, and smallpox are quarantined in Berlin by isolation. Cases of typhoid fever, diphtheria, and scarlet fever are quarantined in the house where they occur. Fumigation is resorted to in each case. Physical examinations of school children are made at regular intervals, usually twice in a school term.

As in most German cities, there is a municipal abattoir in Berlin. There are no regulations applying especially to cold-storage plants. There is, as a matter of fact, only one important storage house of this kind. It is connected with the municipal abattoir. The display of fruit and other eatables on stands in the public streets is permitted.

---

### **MARKET FOR METAL BEDSTEADS.**

[From Consul José de Olivares, Madras, India.]

There is a growing demand in this consular district for metal bedsteads and woven-wire mattresses. Imported wares of this character are steadily supplanting kindred commodities of domestic manufacture. Imports of metal bedsteads and mattresses into the Madras Presidency from all countries during the year 1910-11 were as follows: United Kingdom, \$3,392; United States, \$1,236; Germany, \$228; France, \$124; Straits Settlements, \$20. While the total of \$5,000 is not large, the line of goods represented offers excellent opportunities for exploitation and development in this country.

The style of metal beds used hereabouts has a somewhat wide range, including all iron, combination iron and brass, and all brass; they are also sold in all sizes, including double, three-quarter, single, as well as various sizes in children's cots. Bedsteads are generally preferred with upright corner posts for mosquito netting, although there is also a market for beds without the mosquito net accessories.

The retail prices of metal bedsteads with wire mattresses most commonly sold in this district range from \$5 for the plain all-iron sort to \$50 for the better combination iron and brass style. There is less demand for all-brass bedsteads, the retail prices of which are relatively high, varying, according to size and elaborateness of design, from \$57 to \$96.

---

#### **No Opening for Dentists in Borneo.**

Consul Orlando H. Baker, of Sandakan, does not recommend Borneo to American dentists as a field of operations. There are only 60 white people at Sandakan, and as the few interior settlements are far apart, a dentist would have to travel far to find patients. Hence there are no permanent dentists there. Occasionally a Japanese or Chinese drops in and practices for a short time among his countrymen.

---

Martin & Co., Calcutta, British India, have been authorized to make a survey of the proposed Futwah-Islampur railway. This line will be about 26 miles long.

**BALING AND MARKETING COTTON.****A Great Economic Loss to the United States.**

Cotton is probably the greatest single contributor to the world's commerce. Cotton grown in the United States constitutes about 70 per cent of the entire consumption of the world. Of the 1911 crop there were ginned in the United States upward of 16,000,000 bales of 500 pounds each. At current prices the value of the year's crop is over a billion dollars. Notwithstanding the enormous value of this American cotton crop, no other commodity known to commerce is so carelessly treated by the producer and those engaged in preparing it for market. The money loss to the producers in consequence of this carelessness has been placed by men competent to make intelligent estimates at \$50,000,000 per annum on a normal crop, and, large as is this sum, it does not include many items of fixed charges that attach to the system in vogue of conveying cotton from the gin to the mill that could be dispensed with, the abolition of which would result in a saving of many millions of dollars annually.

The present methods of baling and preparing cotton for market have been a subject for investigation by the Bureau of Manufactures, and the results of inquiries by commercial agents and consular officers have been published from time to time in Daily Consular and Trade Reports and in monographs that were given wide distribution. These publications concentrated public attention upon the disgraceful and wasteful system in vogue, and were followed on the part of common carriers and commercial bodies directly concerned in marketing cotton by efforts to bring about improved conditions. Unfortunately, in the absence of organization that would include the principal growing States, there was no concentration of effort, and in view of the great volume and value, the large area covered, spreading over boundary lines of 10 or more States, and the number and character of the people employed in the industry, it is very doubtful whether remedial measures can be successfully introduced through the initiative of individuals, associations, or States.

**The Present Investigation.**

The great importance of this subject, which is a matter of the utmost concern, not alone to the people of the cotton-growing States, but to the entire country, impelled the Bureau of Manufactures to renew former activities in this direction, and Commercial Agent John M. Carson was assigned to visit the principal points for concentration of cotton in the South, and to confer with men engaged in the several branches of the industry, from the farm to the mill, with the object of ascertaining whether any plan or system for the better and more economical preparation of cotton for market could be devised that would meet with the general approval and cooperation of all the parties immediately concerned. In the course of his inquiries, Maj. Carson found a universal desire for the betterment of existing conditions and a readiness to cooperate in any movement to establish a practical system calculated to secure the marketing of cotton in accordance with modern economic commercial methods.

When completed, the results of Maj. Carson's inquiries, together with observations of existing conditions, and the wastefulness, irritations, contentions, and litigations that naturally spring from them, will be published by the Bureau of Manufactures in pamphlet form for general distribution.

**ALASKAN HERRING TRADE IN CHINA.**

[From Consul General George E. Anderson, Hongkong.]

A determined effort is being made to again build up the trade of American interests in China in salted herring shipped from the Pacific coast of the United States, which assumed large proportions two and three years ago. As indicated in a report of about a year ago, there was a failure to a considerable extent of the herring catch in the Puget Sound country last year and the trade to China languished. Apparently the failure was due only partly to natural causes.

The British Columbia herring catch for the past season, in which American capital is largely interested, is placed at 11,850 tons, and that of Alaska amounts to about a thousand tons additional. Practically the whole of this output is sold on the Japanese and Chinese markets. Shipments from the Canadian and American ports to Hongkong, Shanghai, and Japanese ports already this season have been very large, so it is expected that the trade for the present season will be fully up to the average. American fishing interests are thoroughly canvassing the Chinese market with a view of increasing their sales as their increased output, for which additional facilities are constantly being established, is realized.

The difficulty of building up the export of such goods to China and the Far East generally is largely one of conditions peculiar to the trade. It is difficult to get such goods into this market without selling forward, and it is difficult, if not impossible, to sell forward on a fish catch. Contracts have generally been made for delivery subject to catch, but it is readily understood that if there is a large catch dealers at this end of the line will not be disposed to accept goods ordered at prices representing an average catch, while if there is a failure of the catch shippers in the United States or Canada will not be disposed to fill orders on the basis of average prices to any greater extent than they are compelled to do. As a result of difficulties and losses growing out of such a situation, dealers in Hongkong and in China generally have not been disposed to handle the goods. In general, the possible sale of such fish in China depends altogether upon price. High prices for fish mean practically a suspension of trade. Average prices mean a good trade, while low prices afford a trade practically without limit. Representatives of American fish interests traveling to Chinese ports say that with present average catches there is practically no limit to the possible trade with China—the trade is only limited by the supply of fish.

---

**UNIFORM AGENCY CONTRACT.**

[From Consul Herman L. Spahr, Breslau, Germany.]

The Berlin Chamber of Commerce has officially issued a blank agency form, based on recommendations of experts, whereby to avoid obscurities and prevent trade disagreements. Naturally certain provisions therein are not applicable to all branches of commerce, while other provisions may be added in particular cases. The contract considers (a) the agent's authority, (b) the obligations of the parties, (c) commissions, (d) expenses, and (e) duration of the contract. Furthermore, special provisions are made for the settlement of differences by arbitration. [A copy of this form, in German, will be loaned by the Bureau of Manufactures.]

**A SOUTH AFRICAN AGRICULTURAL SHOW.**

(From Consul E. A. Waksfield, Port Elizabeth, Cape Province.)

Attendance at the Port Elizabeth Agricultural Show during the last week in March was gratifying, the number on March 28 being 25,000.

Exhibits of American machinery should have been more general and of greater variety in order to get proper results. The Port Elizabeth show is the great event of the year in this vicinity from a commercial standpoint, both with the wholesaler and retailer. Hundreds of farmers attend to exhibit stock and produce and also to inspect and purchase machinery and supplies for the coming year. Importers may readily see the absolute necessity of exhibiting such manufactures and products as pertain to the farming community, if they are to be properly introduced.

A clean, bright, up-to-date, commercial town, situated on a beautiful bay, Port Elizabeth has facilities and advantages which commend it to the up-country visitor. The fair adds a liberal prize list, numerous and varied special attractions and exhibits, and exceptional facilities for inspecting manufactures and produce of all description. During the show week business arrangements are perfected which cover fully one-third of the annual turnover for this vicinity.

American manufactures are favorably received and space for exhibiting may be obtained through local agents or representatives. This exhibition is for one week and is held between March 15 and 30 each year. Imported articles exhibited include musical instruments, food products, agricultural machinery, implements and tools, hardware and cutlery, leather manufactures, motor cars and cycles, engines, windmills, pumps, wagons and carriages, paints and oils, boots and shoes, ropes and cordage, belting, and various other lines imported by local business houses.

[A complete list of South African cities where annual agricultural shows are held appeared in Daily Consular and Trade Reports for Mar. 28, 1912.]

---

**EXPOSITION OF WOODWORKING MACHINERY.**

(From Consular Assistant Bartley F. Yost, Paris, France.)

In connection with the Exposition of Agricultural Automobiles, which will be held at Bourges, France, from September 26 to October 6, 1912, there will be added a department of woodworking machinery, which is to be international in its character and under the patronage of the French Minister of Agriculture. The woodworking machinery on exhibition will be classified as follows:

1. Mechanical apparatus for felling trees.
2. Power saws for preparing industrial and stove wood in the forests.
3. Wood-splitting machines.
4. Motor-power machinery for sawing and splitting wood for cook and heating stoves.
5. Stationary power saws.
6. Various woodworking machinery operated by motive power.

For full information inquiries should be addressed to "Commissaire Général de l'Exposition d'Outillage Mécanique, Bourges (Cher.), France."

---

A bridge contract is said to have been awarded to a German firm by the Volga-Bugulma Railway for a \$5,000,000 structure across the Volga, near Simbirsk, Russia.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8873. Sheet copper.**—An American consul in the Levant reports that a business man in his district dealing in tin, zinc, lead, and copper will be pleased to receive quotations from American exporters of sheet copper.
- No. 8874. Soft lumber for furniture making.**—A business man informs an American consulate in a Mediterranean country that he is anxious to get into communication with exporters in the United States of undressed soft lumber for furniture-manufacturing purposes. Correspondence should be in French.
- No. 8875. Organs.**—A report from an American consul in South Africa contains the information that a firm in his district is in the market for cheap American organs to sell to the farmers in the surrounding country. An American merchant doing business in that region states that this firm has excellent connections, covers a big territory, and if an organ can be found to meet the requirements, it will probably handle 100 or more. The firm will pay cash against documents in the United States through its American agents. American firms manufacturing such organs should send catalogues, price lists, and full particulars without delay.
- No. 8876. Silk, cocoons, gum tragacanth, and oriental products.**—An American consular officer in the Levant reports that a well-known firm in his district is desirous of being put in touch with importers of raw silk, cocoons, cocoon waste, skins, gum tragacanth, and various other oriental products.
- No. 8877. Agencies for American goods.**—A business firm in the United Kingdom informs an American consular officer that it is anxious to secure additional American agencies. This firm deals in knitted goods of all kinds, and it already has a number of American connections, but desires more.
- No. 8878. General hardware, metal goods, etc.**—A communication has been received at an American consulate in the United Kingdom from a business man in that country with regard to taking up the sole agency in Great Britain for general hardware, small metal goods, brass foundry, etc. The inquirer is a commercial traveler calling upon large houses throughout the country, and, it is stated, can furnish first-class references.
- No. 8879. Motor boats.**—An American consular officer in Portugal reports that a resident of his district wishes to receive catalogues, price lists, etc., from American manufacturers of motor boats. Correspondence should be in Portuguese.
- No. 8880. Coal.**—From an investigation just made, an American consul in a European country reports that it would appear there would be an opening in his district for American anthracite coal. Exporters of such coal are requested to forward quotations to the consulate in question for quantities of 3,000 to 5,000 tons f. o. b. certain city. Analyses of the varieties offered should also accompany quotations.
- No. 8881. Hotel.**—According to the report of an American consul in Canada a new hotel will be built in his district in the near future, the estimated cost of which will be \$200,000. Plans and specifications can be obtained of a person whose name is given in the report.
- No. 8882. Lumber for building purposes.**—A business firm in the Near East informs one of the commercial agents of the Department of Commerce and Labor that it desires to import American lumber for building purposes. Oak and pine are particularly wanted, but there is a good demand for practically all kinds. A list of the sizes of timbers and boards which are in demand is filed with the Bureau of Manufactures. There is an excellent opportunity for American manufacturers to secure a large share of the lumber trade in the country in question, and the firm referred to has every facility for handling the business. Correspondence in French is desired, but English is understood.
- No. 8883. Canned goods.**—An American consul in Great Britain reports that a well-established commission agent in his district desires to secure agencies for canned meats, beef, mutton, salmon, tongue, beef extract, canned fruits, and baking powder.

## COMMERCIAL PROGRESS OF IRELAND.

[By Consul Hunter Sharp, Belfast.]

Agricultural and rural life in Ireland has been much improved by the system of land purchase introduced under the act of Parliament in 1885 and by supplemental acts enabling tenants to borrow money on Government credit for the purchase of farms. The installment payments of these loans are spread over 50 or 60 years, on such terms that the annual amount required to cover both interest and sinking fund is less than the rent formerly paid.

Under these acts the Government has already advanced more than \$486,650,000, and in the course of another 30 years a large part of the Irish farmers should own their farms free from any charge. To restrain the exodus from the country districts into the large towns laborers' cottages have been built in the country districts. These, with about half an acre of land each, are let to laborers at 24 to 36 cents a week, the difference between the rent charged and the annual cost being borne by the taxpayers.

A congested-districts board has been formed, among its objects being the removal of families from lands too poor and barren to support the number settled on them to more fertile localities, the securing of suitable land for this purpose, the promotion of cottage industries, and the development of the fisheries along the Irish coast.

The Department of Agriculture in Ireland, which has been established about 10 years, has done much useful work in disseminating informa-

"Made in Ireland" trade-mark. Inscription in Gaelic. See page 772 as to its use.

tion and establishing model schools for the instruction of farmers and for training women in dairy work. The Irish Agricultural Organization Society has for its object the teaching of the farmer that whatever legislation may do for him his own energy and industry remain the chief factors in the achievement of rural happiness and prosperity, and instructing him in the accomplishment of this end through the organization of societies for the purchase of his requirements and the marketing of his produce. No less than 100,000 farmers are now so organized in some 907 societies, including creameries, credit banks, agricultural societies, etc., having a turnover of about \$13,528,870 in 1911. Better farming methods are introduced, and the social relations developed do much to counteract the isolation and monotony of farm life.

#### Crop Returns—Live Stock.

Three-fourths of the population of Ireland is engaged in agriculture, mainly in the south and west of the country, and a distinct improvement in the rotation of crops is shown from year to year. The exceptional drought which prevailed during the growing season in 1911 no doubt caused many crops to be harvested in much smaller quantities than would otherwise be the case, but with the good prices realized, the results should be satisfactory. The flax crop suffered for lack of moisture, but while the amount of straw pulled was disappointing the prices for the finished article were fairly up to the average.

The abundant yield of potatoes in northern Ireland in 1910 gave the farmers a fine opportunity to dispose of a large surplus to France and southern England at good prices during the following winter and spring. In 1911 they were again favored with a large crop, giving prospects of large exports to England, the Continent, and the United States. The latter country has already taken a large quantity.

The following table shows the acreage devoted to various crops in Ireland in 1910 and 1911:

Crops.	1910	1911	Crops.	1910	1911
	<i>Acres.</i>	<i>Acres.</i>		<i>Acres.</i>	<i>Acres.</i>
Wheat.....	47,631	45,066	Vetches.....	2,303	2,317
Oats.....	1,073,080	1,040,185	Rape.....	7,885	2,941
Barley.....	168,008	158,180	Other green crops.....	30,233	26,127
Rye.....	5,681	9,026	Flax.....	45,974	60,610
Beans.....	1,839	1,683	Fruit.....	12,064	14,045
Peas.....	293	301	Hay:		
Potatoes.....	502,985	581,259	First year's.....	517,182	542,401
Turnips.....	275,266	270,795	Second year's.....	363,659	386,823
Beets.....	75,287	77,867	Permanent meadow.....	1,540,745	1,573,180
Carrots.....	1,487	1,444			
Parsnips.....	703	696	Total.....	4,792,721	4,861,214
Cabbage.....	30,857	37,281			

The number of the principal live stock in the island excepting sheep shows an increase in 1911 compared with 1910. The following table shows the number of each for the two years:

Live stock.	1910	1911	Live stock.	1910	1911
Asses.....	240,677	246,353	Mules and jennets.....	31,460	31,740
Cattle.....	4,688,888	4,711,720	Pigs.....	1,200,035	1,415,119
Goats.....	242,614	258,474	Poultry.....	4,339,015	5,447,801
Horses.....	613,244	616,331	Sheep.....	3,970,516	3,907,436

**Textile Industry—Small Raw Material Supply.**

More than 90 per cent of the spindles and 95 per cent of the looms in Ireland are in factories in the Province of Ulster, where approximately four-fifths of the world's linen is produced. The latest statistics available are those for 1910, which give the number of yarn spindles as 945,962, thread spindles, 19,120, and power looms, 36,892. In 1907, the latest year for which labor statistics can be obtained, 70,382 persons were employed in the flax, hemp, and jute textile factories, 4,103 in the wool and worsted works, 554 in hosiery factories, 403 in cotton mills, and 250 in silk mills.

Although the linen trade had a fair year during 1911, it did not enjoy the same amount of prosperity as some of the other industries. The extra cost of linen and the fall of 6 cents a pound in the price of cotton during the year restricted business and made flax spinning and manufacturing unremunerative. For four months, beginning October 1, 1911, the spinners worked short time. Earlier in the year the Power-Loom Manufacturers' Association took measures to reduce production in their branch of the trade by 10 per cent.

Owing to the almost complete absence of rain in the flax-growing season, wet and fine warp spinners have found it exceedingly difficult to obtain a sufficient quantity of flax of the requisite fineness in any market. Reports from exporters indicate that the spinners will be obliged to take a larger proportion of the more common varieties of flax during 1912.

The imports of flax into the United Kingdom were the smallest since 1904, totaling 62,403 tons (ton=2,240 pounds). The imports of tow were 17,718 tons. The imports of flax from Russia dropped 3,562 tons, from the Netherlands 239 tons, and from Belgium 3,322 tons from the 1910 figures.

The yarn market was dull at the opening of the year, with steady prices and a small amount of business. Tows were scarce and tended toward higher prices in the April quarter. At the end of the first six months the market was very quiet, with prices lower. In the third quarter prices were unsteady and purchases small, and this condition prevailed to the end of the year. Continental yarns were cheaper. The position of the market was generally sound and healthy, as no big stocks of yarns or cloth were believed to exist. With the exception of 1910, the exports of linen yarns from the United Kingdom during 1911, amounting to 18,003,000 pounds, valued at \$5,932,234, were the largest in quantity since 1899. In value they have only been exceeded once, in 1907, since 1877. The imports of linen yarns into the United Kingdom in 1911 totaled 28,976,012 pounds, against 28,801,612 pounds in 1910.

**Linen Piece-Goods Market.**

The manufacturers of brown power-loom linens experienced a disappointing year. Starting with the average number of orders and prices, the trade gradually slackened and then improved toward autumn. While the decline in yarn prices helped manufacturers who bought short, practically all the advantage had to be given to merchants. The prices in the spring were the most unremunerative since 1908.

There was no great change in the character of the goods made during the year. Colored goods were produced in limited quantities.

as the merchants were very cautious in placing orders. Damask looms were kept fairly busy throughout the year, and this branch of the trade was exempted from the short-time agreements on account of its advance orders. The home trade offset somewhat the sluggishness of the American demand for these goods. There was a steady trade in canvas goods, with prices favoring the buyer. Hucks were in good demand, both at home and abroad, in plain and figured varieties. The makers of shirting linens and cambrics found business unsatisfactory. Brown dress goods were made in fair quantities, but not equal to the 1910 output. Checks, dowlas, ducks, and stripes were placed in moderate quantities during the season. Bleached goods kept well up to the average and did a satisfactory business, although the output was somewhat lessened.

The prospects for 1912 are much better than 1911. The lower prices of yarns offer a safer basis for merchants to operate on, and the outlook in both the home and foreign markets is good.

The exports of linen piece goods from the United Kingdom during 1911 amounted to 194,014,800 yards, valued at \$27,474,755, and the linen manufactures, including sewing thread and other articles, reached a grand total of \$38,177,828, a decrease of \$2,120,168 from the 1910 figures. The best customers for linen piece goods were the United States, which took 107,207,200 yards, valued at \$13,695,698; Australia, 13,321,600 yards, valued at \$2,262,689; and Canada, 12,451,900 yards, valued at \$1,364,182. In each case these returns are below the 1910 figures. The only countries showing increased purchases were the British East and West Indies, Colombia, Panama, and New Zealand.

A textile-testing house was opened at Belfast during 1911, which is proving of increasing value to the trade. All tests are made with the greatest care and absolute secrecy. The testing house is prepared to deal with any samples in connection with the textile trade and its certificates are accepted as evidence in courts of law.

An Irish trade-mark has been adopted and registered in several foreign countries by the Irish Industrial Development Association as a means of promoting the sale of Irish-made goods. It can be used only under a certificate issued by the association, which is granted only to producers of good repute and financial standing, for use on goods of Irish manufacture only. In May, 1911, the right to use this trade-mark had been granted to 495 firms. In addition to protecting its trade-mark, the association endeavors to prevent, by prosecution when necessary, the sale of foreign goods as of Irish manufacture.

[By Consul George E. Chamberlin, Cork.]

#### Foreign Trade Statistics.

The total import and export trade at Irish ports in 1910, the latest year for which statistics are available, was \$636,970,015, as compared with \$611,601,510 in 1909, an increase of \$25,368,505. The imports were valued at \$316,538,948 and the exports at \$320,431,067. These statistics include the trade with Great Britain and the colonies and foreign countries. The total trade with the United States was valued at \$30,651,469—imports \$12,080,877 and exports \$18,570,592.

The following table gives the quantities and value of the articles imported into Ireland during 1910 (ton=2,240 pounds, hundred-weight=112 pounds):

Articles.	Quantity.	Value.	Articles.	Quantity.	Value.

Farm produce and food and drink stuffs represent 36 per cent of Ireland's import trade and 54 per cent of its exports; manufactured goods 49 per cent of the imports and 40 per cent of the exports; and raw materials 15 per cent of the imports and 6 per cent of the exports.

The Secretary of the Department of Agriculture and Technical Instruction, in a recent report, stated:

It is estimated that not more than one-fifth of the Irish exports go to colonial and foreign countries, the other four-fifths remaining in Great Britain; and while it is much more difficult to ascertain what proportion of imports into Ireland are of colonial

and foreign origin, it seems probable that at least one-third are articles of such origin, the remaining two-thirds being the produce of Great Britain.

The following table gives the quantities and values of the articles exported from Ireland to all countries during 1910:

Articles.	Quantity.	Value.	Articles.	Quantity.	Value.
Ales, spirits, wines, and beverages:			Musical instruments.....		\$104,065

## BELFAST.

[By Consul Hunter Sharp.]

The commercial record of 1911 for Belfast was satisfactory and the activity in local industries was general and well distributed. There was an increase in the coasting and transchannel trade of 1,241 tons, but the labor troubles at the deep-water docks in the summer, which

diverted a certain amount of over-sea traffic from this port, caused a decrease in the foreign trade of 31,762 tons. The linen industry passed through a period of difficulty, rather than of depression, which handicapped all branches of that trade. Flax values continued high throughout the year, checking the demand for finished goods. The lack of sufficient female labor also caused some inconvenience in the textile trade.

#### **Activity in the Shipbuilding and Other Industries.**

In shipbuilding and marine engineering unusual prosperity was experienced throughout the year and a vast army of workers received steady and remunerative employment, which meant much to the community as a whole. The percentage of unemployed in Belfast is said to be the lowest in the United Kingdom. During the latter part of the year, the wages of no less than 10,600 employees in the shipyards were increased.

In the two shipyards of Belfast over 22,000 men were employed in 1911, with a weekly pay roll of \$175,194, and a total production of 20 vessels of 184,608 gross tons, against 16 vessels of 165,854 tons in 1910. The most important launch of the year was the *Titanic*, built at Belfast.

The manufacture of rope and twine takes third place among Belfast's industries, the one company engaged in this trade giving employment to some 3,500 persons. The output for 1911 was up to the average of recent years, but raw material was scarce and dear, and the increased cost was not met by an increase in the selling value of the product. There was some labor trouble during the year in this trade, but it was ended in a few days.

Other local industries, including the manufacture of marine engines, textile machinery, heating, ventilating, and drying apparatus, chemicals, roofing felt, paper, packing cases, fancy boxes, wood products, leather and leather goods, and a number of specialties in connection with the shipbuilding works were for the most part prosperous during the past year.

#### **Population and Emigration—Industrial Organizations.**

The population of Ireland on April 2, 1911, was 4,381,951 persons, showing a decrease of 76,824 since 1901. An increase of 7 per cent was shown in the Province of Leinster and decreases in the other three Provinces. The number of families in 1911 was 912,711, an increase of 2,455 since 1901, and the average number of persons per family was 4.8, against 4.9 in the earlier year. Belfast increased from 349,180 to 385,492 in the 10 years from 1901 to 1911, Dublin from 290,638 to 309,272, and Cork from 76,122 to 76,632.

The emigrants leaving Irish ports numbered 30,573 in 1911, a decrease of 1,884 from the 1910 figures. Of these, 16,671 were males and 13,902 females. Most of the emigrants went to the United States and Canada, the former taking more than half of the total.

The Belfast Industrial Development Association opened a permanent exhibition in this city on August 7, 1911, at which the variety and value of Ireland's industries are demonstrated. The purpose of the association is the promotion of the sale of Irish products and the safeguarding of the interests of the manufacturers by attempting to prevent fraud or misrepresentation by traders. It also seeks to impress upon the shopkeepers and the public the economic importance

of retaining money and labor in Ireland by encouraging the sale of Irish goods. Goods manufactured in the country are kept prominently before the public by means of the exposition, and the articles exhibited include: Stained glass, tobaccos, cigarettes, paints, varnishes, enamels, inks, jams, sweets, flour, biscuits, cakes, boots, soaps, candles, perfumes, counter cases, metal polish, boot polish, disinfectant powders, electric motors, cider, mineral waters, oatmeal, flaked rice, coco, books, lantern slides, washable paints, roofing felt, enameled jewelry, decorative woodwork, furniture, toys, rugs, bedsteads, embroidery, Irish lace, Irish crochet, every description of Irish embroidered linen goods, damasks, samples of illuminated work—Celtic and otherwise, threads, wicker chairs, baskets, brushes, bedding, boots, woolen materials, serges, threads, matches, waterproof capes, coats, galvanized ware, aluminum cooking utensils, etc.

#### **Harbor Improvements—Real Estate—Railways.**

The event of the year in connection with Belfast Harbor was the opening, on April 1, 1911, of the new graving dock, one of the largest in the world and unrivaled in equipment. Its pumping plant and capstan installation are the finest ever established in connection with a work of this kind. The dock is so constructed that it can be enlarged without being put out of commission, and operations have already been considered for making available the extreme width at the entrance of the dock for an entering ship. The length can also be easily increased.

Other important harbor improvements were made during the year, some of the heaviest being for the accommodation of the giant new trans-Atlantic liners. By extensive dredging and cutting away a large part of the southern end of West Twin Island a turning basin was provided for the big ships, which has been successfully used by the *Olympic*. A considerable area of low mire was filled up to quay level with the dredged material, and this reclaimed land near the existing shipyards will eventually be very valuable for industrial purposes. The harbor property has been maintained in a high state of efficiency and every care has been taken to provide facilities for the accommodation and quick discharge of vessels.

Property sold somewhat more freely during 1911 than for several years past, and modern houses are at a premium.

The Great Northern, Midland, and Belfast & County Down Railways, having a total length of 885 miles, showed total receipts of \$7,964,044 and expenses of \$4,884,019 in 1911, against \$7,797,904 and \$4,634,600 in 1910. The decrease in net receipts from \$3,163,304 to \$3,080,025 was shared by all three roads.

#### **Imports of Foodstuffs and Timber.**

Owing to the decreased exports of corn from Europe, the price of corn increased during 1911, reaching a maximum of \$7.30 per 480 pounds at Belfast, and fluctuating over a range of \$2.18. Belfast has been for the past 10 years one of the principal importers in the United Kingdom of corn from the United States, largely owing to the existence of two direct lines of steamers connecting with New Orleans, Galveston, and Baltimore. This district has long been noted for superior corn milling, and the millers complain that for the past few years a great deal of soft-grained corn, containing a high percentage

of moisture, has found its way into corn shipments from the United States. They advocate a radical change in the system of grading corn in the United States to avoid this trouble. Largely on account of the labor troubles at the docks during July and August, the transshipment of corn to outports from Belfast decreased from 61,613 tons (ton = 2,240 pounds) in 1910 to 37,130 tons in 1911.

Although the flour mills of Belfast did not work under the extreme pressure experienced during 1910, there were few milling centers where the production amounted to a larger percentage of the maximum capacity. One of the large mills was burned in September. The bakery trade would have had a normal year had it not been for the strike that took place in October, although profits would hardly have been as high as those of 1910, owing to the high price of flour and the comparatively low price of bread. Owing to the scarcity of feed stuffs, local mill by-products commanded exceptionally high prices during the latter half of 1911.

The international movement of wheat was much less in 1911 than in the preceding year, as the production throughout Europe was more evenly distributed and the fluctuations in price were much less than usual, being about 97 cents per 480 pounds. The trade at Belfast was interfered with by labor troubles and the imports of wheat fell off 17,784 tons from the 1910 figures.

The heavy stocks of spruce carried over from 1910 reduced the imports of this class of timber, but other timber imports showed a marked increase. Prices were high and the margin of profit small. The slackness of the building trades was responsible for a decline of 1,396 tons in the imports of slates.

The price of sugar was nearly doubled by the drought on the Continent, which practically ruined the beet crop, and the large amount of cane sugar imported was not sufficient to make up the shortage.

#### Woolen and Coal Trades—Market for American Goods.

It is estimated that over three-fourths of the Irish wool clip is exported, and in spite of the increased output of the Irish woolen mills the imports of woolen goods still exceed the exports. The Irish mills had a prosperous year and their products were in good demand. Irish dealers are giving a marked preference to all home-manufactured goods, which is likely to increase as long as only pure wool is used and the quality and patterns are kept up.

The coal trade, which contributes about one-fifth of the total revenue of this port, was subject to great activity and unrest. The putting into operation of the mines act did not give entire satisfaction, and this was attended by other difficulties. Prices in the summer were lower than in 1910, but rose toward the end of the year with the apprehensions of a strike of the colliers.

American-made footwear is not so much in demand as formerly, as British goods can now be obtained in the same styles and prices and are said to be better adapted to this damp climate. Irish-made boots are much sought after, and the manufacturers can barely supply the demand.

The principal American goods coming into Belfast are agricultural machinery, brushes and brooms, drugs, farm implements, fruits (chiefly fresh apples and pears), canned pears, peaches, apricots, and pineapple, office desks and sectional bookcases, glucose, barley, cottonseed cake, cottonseed meal, flour, Indian corn, corn meal,

wheat, hardware, lard, shooks and staves, bacon and tinned meats of all kinds, typewriters, adding machines, cash registers, automobiles and motor cycles, organs, phonographs, piano players, petroleum, boots, shoes, rubber footwear, roofing slates, canned soups, canned corn, surgical implements, tobacco, barbed wire, and nails. There is a market here for asbestos, cement, cheese, confectionery, window glass, bottles, mirrors, paper, soaps, and sawmill machinery.

#### Trade Conditions—General Imports.

Imports into Belfast, except shipments in bulk, are generally made through agencies in the larger cities of England. The usual terms on which Belfast merchants buy in the English market are open credit with 5 per cent discount for cash in 30 days. In the case of provisions, such as canned fruits and meats, lard, and bacon, shorter credit and a discount of 2½ per cent are ordinarily allowed, though some of the sales are made for net cash. In the grain and flour trade, drafts drawn at 60 to 90 days are attached to the bills of lading, and no discount is made except a rebate of interest whenever a draft is taken up before its expiration.

The following table shows the principal imports into Belfast, in tons of 2,240 pounds, for 1910 and 1911:

**General Export Trade.**

The export trade in aerated waters manufactured at Belfast is annually becoming more important with the increasing fame of the local brands. In 1911 the United States alone imported ginger ale from Belfast to the value of \$103,332. The exports of biscuits showed a slight increase over 1910, and this trade experienced a record year. Motor delivery service brought about a great expansion in the local trade of one biscuit firm. A plant of the most up-to-date type has been installed to cope with the demand for the various kinds of biscuits.

The exports of butter from Belfast also showed a small increase, and the prices realized during the greater part of the year were very satisfactory, owing to the decreased output of many of the butter-producing countries. It is said that Irish butter could compete with the Danish product if the farmers would take up winter dairying so as to make a supply available during the entire year.

The exports of confectionery from this port, amounting to 2,139 tons, showed an increase of 104 tons over 1910, and the home business also showed a proportionate increase. This industry was naturally hampered by the high price of sugar.

The principal exports to all countries from Belfast during 1910 and 1911 were as follows, the tons being of 2,240 pounds:

Articles.	1910	1911	Articles.	1910	1911
<b>Animals:</b>	<i>Number.</i>	<i>Number.</i>	<b>Lard</b>	<i>Tons.</i>	<i>Tons.</i>

<sup>1</sup> Loads.

**Exports to the United States.**

The exports to the United States from Belfast during 1911 showed a decrease of \$792,072 compared with the 1910 exports, and were \$1,444,039 below those of 1909. Manufactured textiles formed 87 per cent of the total 1911 trade, linen manufactures alone making up 78 per cent. The total value of the linens exported was \$920,960 less than that of the 1910 shipments. Heavy decreases were also shown by union and cotton goods. Other features of interest in the trade with the United States were the increase in the shipments of flax and the heavy potato exports.

The exports, according to consular invoices, from Belfast to the United States during 1910 and 1911, were as follows:

Articles.	1910	1911	Articles.	1910	1911
Cartons.....	\$5,678	\$4,202	Machinery.....	\$110,830	\$96,357

The American goods returned during 1911 were valued at \$10,224.

The exports to the Philippine Islands amounted to \$8,189, as against \$12,628 in the previous year. The articles for 1911 were: Linen manufactures, \$6,076; union goods, \$1,306; cotton goods, \$155; felt, \$456; and jute canvas, \$196. Those to Porto Rico in 1911 were valued at \$2,096, consisting of linen goods, \$1,500; and union goods, \$596. To the Panama Canal Zone were sent linen goods with a value of \$327. There were no exports to the Hawaiian Islands in 1911.

The tonnage of the vessels clearing from Belfast during 1911 aggregated 2,841,553 tons, as compared with 2,800,285 tons in the preceding year. There were 437 arrivals from foreign ports during the year.

#### LONDONDERRY AGENCY.

[By Consular Agent Philip O'Hagan.]

The chief industries of Londonderry are the manufacture of shirts, collars, underclothing, and ladies' corsets. There are several factories engaged in the three first-named industries, and about 2,000 workers are employed throughout the year, besides a large number in the rural districts where the manufacture of shirts and collars is carried on in the cottages. This rural work is conducted by means of agencies scattered throughout the small towns and villages.

About 90 per cent of those employed in these industries represent women, and their average wage is \$3 per week. Some of the more skillful and experienced operators earn \$5 to \$6. The finished products of the Londonderry shirt and collar factories find their way to practically all the markets of the world. Considerable quantities go to the United States, but as all the local factories of any importance have warehouses in London, Manchester, and Glasgow, the goods are invoiced at those places for shipment and therefore are not credited to this agency. The factories are well equipped, and the comfort of the workers is carefully considered.

**Shipments of Live Stock—Minor Industries.**

Besides the exports of shirts, collars, and underclothing, practically the only shipments from here are agricultural produce and live stock. There were shipped to Great Britain last year 83,801 head of live stock, against 111,633 for 1910. The principal exports last year were: Cattle, 57,171; sheep, 23,116; pigs, 2,241; and horses, 264. Considerable shipments of poultry, eggs, and dairy products are also made to Great Britain.

In addition to the local industries given, there is a tanyard, a shoe factory, five bacon-curing factories, and a distillery. It is the largest distillery of patent still in Ireland, the produce being used principally for blending.

The possibility of the local shipbuilding yard resuming operations in the near future is doubtful. This yard has many advantages. There are facilities for building and launching vessels of 4,000 and 5,000 tons, and the yard is equipped with fairly suitable buildings. The port and harbor commissioners are willing to rent it free or at a nominal figure to any reliable shipbuilder.

**Shipping and Exports to United States.**

Two lines of steamers ply regularly between here and the United States, the Anchor and the Allan Lines. The tonnage of the ships arriving at the port last year from trans-Atlantic ports was 290,322, compared with 274,099 for 1910, while the shipping leaving for trans-Atlantic ports amounted to 650,323 and 633,000 tons for 1911 and 1910, respectively. The great difference between the tonnage of the departing and arriving trans-Atlantic shipping is due to the fact that Canadian steamers westward bound rarely call here but go direct to either Glasgow or Liverpool. The port and harbor revenues for last year amounted to \$109,000 compared with \$106,100 for 1910.

The exports to the United States invoiced at the consular agency at Londonderry during 1911 were valued at \$169,837, as compared with \$156,736 in 1910. The items in 1911 were: Pickled herrings and mackerel, \$160,554; whisky, \$1,805; woolen goods, \$2,417; potatoes, \$4,799; hand-knitted gloves, \$262.

---

**CORK.**

[By Consul George E. Chamberlin.]

The improvement in the general trade conditions of southern Ireland noted during 1910 continued during 1911. The railway and seamen's strikes last fall caused considerable loss to transportation companies, but they were of short duration and trade soon resumed its normal condition. The price of farm produce was much above the average, crops were good, and on the whole farmers and merchants report a very satisfactory year.

The output of bacon and hams exceeded that of 1910, when the exports were valued at over \$17,000,000. The manufacture of woolen goods is not extensive in this district, being carried on by a number of small mills, the largest of which, located at Blarney, employs some 600 hands. The output of these mills was somewhat larger than that of the previous year. There was also an increase in the manufacture of boots and shoes, while in the furniture, hand-made lace, distilling, brewing, and fishing industries the volume of business was about the same as in 1910.

The grain market was unsteady. During the first 3 months of the year wheat sold at \$1.01½ per bushel, corn at 60½ cents, and barley at 56½ cents per bushel. On September 1 wheat had advanced to \$1.19½ per bushel, and in December corn and barley advanced to 88 cents and 76½ cents per bushel, respectively.

A new dry dock was opened in September at the shipyard at Haulbowline, which will accommodate the largest war vessels. The number of men employed in the yard was increased from 1,000 to 1,050, and work was plentiful throughout the year.

#### Import and Export Trade.

There are no statistics available showing the import and export trade of this district in 1911, but merchants thus engaged have experienced a good business, and it is believed that this trade, which is chiefly with England, will show a fair increase over the previous year.

The following table shows the principal imports, by quantities, into Cork during 1909 and 1910, being the latest statistics available:

Articles.	1909	1910	Articles.	1909	1910
Arms and ammunition...cwt..	1,222	1,026	Malt.....cwt..	64,905	54,322
Breadstuffs:			Oils		
Barley.....do.....	43,848	45,648	Petroleum and paraffin,		
Biscuits.....do.....	6,833	5,700	gallons.....	558,252	537,840

**Shipping and Emigration—Trade with the United States.**

The registered tonnage entering the port of Cork (Queenstown) during the year ended July 31, 1911, was 4,325,214 tons, of which trans-Atlantic liners, discharging passengers and mail only, made up 3,341,123 tons. These liners take on and discharge no cargo at this port. The total number of passengers embarking at Queenstown for the United States during 1911 was 25,214, divided into 5,544 cabin and 19,670 steerage. The total for 1910 was 33,696.

The sale of American automobiles increased materially in southern Ireland during 1911, and it is believed that with more thorough representation this trade could be extended. The chief imports from the United States are: Cotton, flour, corn, illuminating oil, barley, wheat, tobacco, lumber, cotton seed, boots and shoes, meat and dairy products, etc. Sales would be increased in many of the above lines through proper representation, as well as in many other lines which at present have a limited sale, such as hardware, motor boats, tools, farm implements, tinned fruit, tinned vegetables and provisions, stoves, machinery, adding and computing machines, etc.

The declared exports from this consular district decreased from \$261,453 in 1910 to \$233,518 in 1911, chiefly owing to the falling off in pickled mackerel shipments, which, together with hides and skins, are the principal exports to the United States.

The following comparative statement shows the value of merchandise declared at the consulate at Cork and the consular agency at Limerick for export to the United States during the past two years:

Articles.	1910	1911	Articles.	1910	1911
Bacon.....	\$9,281	\$13,124	Paintings.....		\$170
Bulbs.....	288	212	Photographic materials.....	\$90	1,571
Church vestments.....	294	102	Silverware.....	148	170
Hides and skins.....	120,322	125,054	Whisky.....	3,013	3,762
Horses.....	270	389	Woolen goods.....	1,447	977
Lace and crochet.....	6,010	3,378	All other articles.....	8,015	
Mackerel.....	106,916	80,702	Total.....	261,453	233,518
Magnesia.....	5,359	4,407			

[From the London Times.]

**University Education in Ireland.**

The commissioners who were intrusted with the launching of the National University of Ireland and its constituent colleges completed their work last July. By the financial clauses of the university act, Dublin was allotted an annual grant of \$176,000, Cork \$97,000, and Galway \$58,000. The original endowment of the Royal University of Ireland was divided between the National University and Queen's University, Belfast; \$730,000 was given for building to the new university and college in Dublin, \$68,000 to University College, Cork, and \$29,000 to University College, Galway. The Cork college has since built chemical and physical laboratories which compare in space, equipment, and general excellence with those of any university in the British Isles. The authorities of University College, Dublin, were compelled to postpone their building operations, owing to the difficulty of obtaining a suitable site, until Lord Iveagh gave an excellent site adjacent to the old Royal University of Ireland. So far no provision has been made in the Dublin college for technological subjects, but it is probable that the Royal College of Science will be "recognized" for the purpose. St. Patrick's College, Maynooth, was admitted to "recognition" by the senate on February 23, 1910. In 1911 the request for "recognition" from two women's colleges in Dublin was refused. There has been a significant increase in the number of students seeking university education since the establishment of the National University.

Soon after the passing of the university act a strong agitation sprang up in favor of making Irish compulsory for matriculation. The senate decided to make a course

in Irish obligatory for those who did not take it at matriculation until 1913, in and after which year it was to be obligatory for matriculation.

Scholarships have been provided by the different counties and other scholarship endowments have been provided by private individuals and the colleges. The students' fees for the courses in the different faculties are approximately the same for each constituent college. For the full course the fees in the faculties of arts and commerce are \$48 for the session; in engineering, \$78; in medicine, \$83; and in science, \$68. Each college conjointly with the external examiners who are unconnected with any of the constituent colleges, conducts its own examinations, confers its own degrees, and thus practically performs all the essential functions of an independent university.

### **SOUTH MANCHURIAN NOTES.**

[Collated from local papers by Consul Albert W. Pontius, Dalny.]

#### **New Fertilizer Factory—Fushun Coal—Fruit Raising.**

A \$100,000 fertilizer manufactory is under project at Dairen (Dalny) which plans to produce phosphoric acid, ammonia, animal bone, etc.

The demand for Fushun coal in Manchuria increases. It barely reached 130,000 tons in the working year 1908, increased to 218,000 tons in 1909, to 347,000 tons in 1910, and further to 460,000 tons during the working year 1911 ended on March 31 last. This does not include bunker coal.

The agricultural experimental station, Dairen, has distributed free of charge recently about 30,000 apricot, peach, and plum trees to applicants in the Leased Territory, and is growing 50,000 additional trees for next year's distribution.

#### **Import of Formosan Sugar.**

The import of Formosan sugar from Takao to Manchuria, via Dairen, is increasing steadily. From 346 tons (at the rate of 15 bags per ton) in 1910 it increased to 1,446 tons in 1911, which formed more than 20 per cent of the total imports. The Osaka Shosen Kaisha has opened a regular steamer service between Dairen and Formosan ports from April 1, which will greatly facilitate the import of Formosan sugar. The output of sugar in Formosa last year, together with the stocks brought forward from the preceding year, is put roughly at 4,515,000 bags, including white, brown, and black varieties. Granting that 3,200,000 bags find their way to Japan this year, 1,300,000 bags will be left for export abroad.

#### **South Manchuria Railway Improvements.**

The second installment (\$3,000,000) of the South Manchuria Railway Co. share capital to be called up by June 1, 1912, at the rate of \$30 per share of \$100, will be employed for the improvement of the harbor facilities at Dairen, the completion of what little work there is left on the Mukden-Antung line, and sundry other undertakings maintained by the company. The management denies the rumored promotion of some new enterprises. Although the company's accounts are to be closed once annually, instead of semiannually as heretofore, semiannual dividends will be continued.

#### **Storage of Bean Oil in Bulk.**

The South Manchuria Railway Co. management arranged for the storage of bean oil in bulk from April 10. The company undertakes the examination of bean oils intrusted to its custody, upon its own account. The method of examination is to be very simple. Expert examiners will inspect the oils for storage in the presence of their owners and will pass their opinions on the goods, which are to be tacitly indorsed by the company. It is understood that the company will hold itself responsible for only 99 per cent of the original quantity. The storage charge will be 40 cents per ton for every 10 days or less, in place of 25 cents as formerly.

#### **Seismograph of the Omori System.**

A seismograph of the Omori system, invented by Prof. F. Omori, the highest authority on seismology in Japan, has arrived recently at the meteorological observatory, Dairen. This instrument is of the best improved type in use, and is capable of registering the velocity of all seismic shocks two hundred fold. It is arranged to give a complete record of every particular of an earthquake movement which may occur in any part of the world.

**FOREIGN TARIFFS.****ARGENTINA.**

[From Board of Trade Journal, Mar. 21, 1912.]

**Proposed Tariff Commission.**

On February 21, 1912, the Chamber of Deputies of Argentina passed a bill for the appointment of a permanent tariff commission, to be known as a Valuation Board (Junta de Aforos). The duties of this board shall be as follows: To draw up periodically projects for the modification of the valuations in force; to propose such reforms in the customs duties and in the customs regulations as experience shows are necessary, and which, if accepted by the Executive, may be submitted for the consideration and approval of the legislature; to advise the Executive and the committees of the legislature regarding petitions, projects, and matters relating to customs exemptions and reductions or increases in the import duties; and to deal with all matters concerning the publication of customs tariffs and supplementary lists of changes in duties or valuations. The bill contains certain stipulations for the manner of procedure of the board.

---

**AUSTRALIA.****Denaturation of Edible Vegetable Oils.**

Customs regulations for the denaturation of edible vegetable oils imported for industrial uses, in effect from December 1, 1911, were published in the Commonwealth of Australia Gazette for January 20, 1912. A copy of the regulations is on file in the Bureau of Manufactures.

---

**CANADA.**

[From Consul General John G. Foster, Ottawa.]

**Admission of Workmen's Tools.**

Complaint has been made by American firms because duty is collected in Canada on boxes of tools imported into Canada for use in erecting machinery for woolen mills. In this regard the Canadian Department of Customs holds that workmen coming into Canada are allowed to bring in free of duty tools which belong to them personally, but there is no customs provision under which free admission is authorized for the tools which belong to a company, although such tools are sent to Canada to be used by men who are in the employ of that company.

I understand that if the workman should become the owner of the kit of tools, so that he could swear that they were his personal property, the tools, as tools of trade, would be admitted free of duty, provided that they were imported at the time the owner entered the country.

**Government Grain Regulations.**

There is on file in the Bureau of Manufactures a copy of an act assented to April 1, 1912, known as the Canada Grain Act. This act provides for the appointment of a board of three grain commissioners, for the division of the country into sections for grain inspection, and for general Government oversight in matters of warehousing, grain elevators, and standardization of grain.

**FRANCE.**

[From Journal Officiel, Apr. 13, 1912.]

**Customs Regulations for Meat in Transit.**

The Minister of Agriculture of France has reversed the ruling for the customs treatment of meat in transit published in customs circular of October 23, 1911. [See Foreign Tariff Notes, No. 6, p. 189.] It was held in the former ruling that fresh meat and chilled or frozen meat in transit through France were subject to inspection by a veterinarian at the time of entry into the country and consequently liable to the fee of 1 franc per 100 kilos for the examination. The present order is to the effect that such meat in transit is not subject to the examination by a veterinarian at the time of entering the country and is not liable to the fee.

In case the meat which has passed through France in transit to another country is refused entry in the country of destination, the meat will not be allowed to remain in France, and the French customs authorities are empowered to decide what shall be done with it.

**GREECE.**

[From British Board of Trade Journal, Mar. 14, 1912.]

**Reduction of Duty on Sugar.**

The British Government has been informed that a Greek law reducing the rate of customs duty on cane and beet sugar, sugar made from fruit and starch, and sirups derived from sugar, to 45 drachmas paper per 100 kilos (about 3.9 cents per pound) has gone into effect. [See Foreign Tariff Notes, No. 6, p. 178.] The former rate on sugar was about 7.4 cents per pound.

A decree under this law was published providing for the manner of packing for all sugar, whether imported or of domestic manufacture.

**PORTUGAL.**

[From Diario do Governo, Apr. 16, 1912.]

**Free Importation of Fruit from Colonies.**

By a decree of the Portuguese Government of April 13, 1912, it was announced that fresh fruits and dried fruits imported into the country from the Portuguese colonies should be exempt from customs duty.

**RUSSIA.**

[From Vvestnik Finansov, 1912.]

**Duty on Compounds for Dipping Animals.**

The following subsection has been added to tariff No. 91 of the Russian customs tariff:

(3) Products for dipping and healing animals: In powder form, 0.30 ruble per pood (\$0.43 per 100 pounds); in liquid form, gross weight, 0.25 ruble per pood (\$0.36 per 100 pounds). The products mentioned may be imported according to special lists prepared by the Veterinary Commission with the approval of the customs department, provided the consignments be duly accompanied by certificates issued by officials or institutions of the principal administration of

domestic economy and agriculture, to the effect that the products are intended for dipping or healing animals.

**Continued Free Admission of Vessels.**

The law of July 1, 1908, continuing the free admission of seagoing vessels is maintained in force until January 1, 1913.

---

**SALVADOR.**

[From Consul General Harold D. Clum, San Salvador.]

**Increase in Duty on Galvanized-Iron Roofing.**

The Government of Salvador, in order to place the importation of improved roofing on more favorable terms of competition with galvanized-iron roofing, has increased the duty on galvanized-iron roofing. The former duty on galvanized-iron roofing was 3 centavos silver (about 1.2 cents) per kilo (a little more than one-half cent per pound), and no surtaxes were applicable; now an "aforo" of 1 centavo per kilo has been imposed, making the duty, with surtaxes, amount to a little more than 3 cents per pound.

---

**SWEDEN.**

[From Handelsberichten, Netherlands, Apr. 18, 1912.]

**Reduction of Duty on Oats.**

The Dutch minister at Stockholm has reported that the Swedish Riksdag on March 23, 1912, voted to reduce the duty on oats and oatmeal from 6.50 crowns to 3.50 crowns per 100 kilos (from 79 cents to 43 cents per 100 pounds).

---

**TRIPOLI.**

[From Moniteur Officiel du Commerce, France, Apr. 11, 1912.]

**Port Charges.**

The Italian acting governor of Tripoli has published a list of port charges which will be collected in the ports of Tripoli. These taxes fall under the heads of sanitary and lighthouse dues and are based on tonnage.

---

**THE RUSSIAN BUDGET.**

A digest of the Russian budget for 1912 (a summary of which appeared in Daily Consular and Trade Reports on Nov. 6, 1911), especially as to the revision made therein by the budget committee, has been embodied in a lengthy report by Consul General John H. Snodgrass, of Moscow, who says: "The credit allowed to the Ministry of National Education has been raised by 70,000 rubles (\$36,050) for the construction of a chemical laboratory at Kharkoff University." Also "A new pension system for the benefit of civil servants is being devised, and the Government expects to be able to present the same to the Duma this year. This will cause a large increase in the demands upon the treasury." The budget also provides for the construction of four men-of-war for the Baltic Sea; three men-of-war, nine torpedo boats, and six submarines for the Black Sea.

Consul General Snodgrass's complete report will be loaned by the Bureau of Manufactures to those interested.

### UTILIZING LOW-GRADE COAL.

The University of North Dakota has been conducting some interesting experiments on the utilization of lignite for gas making and in the manufacture of briquets. A plant operated by the School of Mines of the university has been located at the mining substation at Hebron. In a letter to the United States Geological Survey, dated April 23, 1912, Prof. E. J. Babcock, dean of the College of Mining Engineering, says:

We are doing a very large amount of research work at this plant on the use of various binders, the best methods of preparing the coal, as well as the best methods of mixing and pressing. We are improving our plant and enlarging it so as to get data more nearly approaching those of a commercial plant. Thus far we have made but small quantities of briquets, but by the methods which we are working out we have gotten very excellent results.

The briquets are of high grade, stand well in the fire and on exposure to atmospheric agencies. They are of high heat value, being raised from 7,500 or 7,800 in the raw lignite to about 12,000 British thermal units in the finished briquets. After the improvements are completed, which we are now making, our experimental plant will be able to run uniformly at a rate of 10 tons per day. We operate a gas plant in connection with the lignite plant, thereby generating gas from lignite and briquetting the residue. This residue gives a high heat unit briquet.

We condense about  $1\frac{1}{2}$  tons of raw lignite into 1 ton of briquets in this manner. The gas and other by-products are saved. We derive approximately 10,000 cubic feet of 400 British thermal unit gas per ton of reasonably dry lignite. We have tried a great variety of binders and methods.

The production of coal in North Dakota in 1911 was 502,628 tons, valued at \$720,489, or about five times as great as in 1910. The Survey adds:

The development and utilization of the lignites of North Dakota, as of Texas, must depend on relatively local markets, for as they disintegrate rapidly on exposure to the atmosphere they do not bear long transportation and must be used a short time after being mined. Lignite is not a high-grade fuel and on account of its large moisture content does not reach high temperatures in combustion. It is therefore undesirable for steam raising, though it can be used for that purpose in specially constructed furnaces with large grate areas. It does, however, serve fairly well for a domestic fuel where other coals are obtainable only at a high price. It has also been found, on account of its smokeless and sootless qualities, well adapted for burning brick, one of the few manufacturing industries of North Dakota, and considerable quantities are burned each year in brick kilns at Dickinson, Scranton, and Kenmare.

### PHILIPPINE BUSINESS NOTES.

[From the Manila Free Press.]

**New armory.**—The recently chartered Memorial Association of the V. A. P. has bought 13,000 square feet of land in Manila on which a \$15,000 armory for the order will be built.

**Oil in Philippines.**—The Division of Mines, Bureau of Science will make a geological survey of Tayabas Peninsula, following a topographical survey to be made by the Bureau of Lands. The survey work is to determine the presence of oil in paying quantities. At present there are about 100 placer petroleum claims in this Province.

**Agricultural bank.**—Twelve branch agencies of the agricultural bank of the Government have been started in provincial capitals since January 1. The agencies have been placed in charge of provincial treasurers, who will confine themselves for the present merely to receiving deposits and carrying a checking account.

**New American bank for Philippines.**—W. Morgan Shuster, who accepted a position as foreign agent of the National City Bank of New York, is expected, on the completion of his tour of South America, to visit Manila with the view of the establishment of a branch of the bank here. Besides the institutions already established here, there is the French Agricultural Bank, whose advent in the Philippines is assured, and the likelihood of provincial banks to be founded as a result of propaganda started by the Filipino Economic Association. There must be taken into account also the plan for provincial banks being carried out by the Bank of the Philippines.

**GOLD DISCOVERIES IN VENEZUELA.**

[From Consular Agent W. Henderson, Ciudad Bolívar.]

Some very rich discoveries of gold have been made in the interior of Venezuela. One, in the municipality of El Callao not far from the Yuruari River, has been named *Salva la Patria*. It is calculated that up to now (Apr. 15) this mine has yielded over 35,000 ounces of fine gold. During the month of March more than 6,000 ounces arrived at Ciudad Bolívar, and in the first two weeks of April the arrivals amounted to more than that, and the gold is coming in all the time.

Near the Caroni River and also in the Paragua district gold has been taken out, but not in such large quantities. The extremely low level of the water in the Caroni River caused a small island to appear in its course, and from this some gold was taken; but the river is now rising and has covered the island, so that work there has necessarily ceased.

**The Situation at *Salva la Patria*—Mining Titles.**

The following statement appeared in a letter from a merchant in the interior, in which he writes about the *Salva la Patria*.

There are two *barrancas* (shafts) dug by a group, which are simple pools of gold. I have seen eight pieces of more than 40 ounces each, all containing more gold than stone. With such *barrancas* the greatest disorder prevails; outside people get in at night and have taken out more gold than the owners themselves, who have had to fence up the approaches and have an armed guard at night.

Of course the Government will soon restore order, and one does not now hear of any disturbance. There are some 2,000 men digging or exploring around the *Salva la Patria*, and of course all are not successful. From what I understand, the gold is found in pockets or chimneys 50 to 100 feet down, and not in true veins.

Permits to work may be granted by the jefe civil (mayor) of the district; afterwards the titles must be taken out in Caracas from the National Government. The maximum permit is for 200 hectares 494.2 acres and for a term of 90 years.

**Transportation Difficulties—Work in Progress.**

It is a well-known fact that the interior of Venezuela, even where gold has been discovered, has up to now only been scratched over, and the larger part has not been explored, so these discoveries must continue. The gold now coming in is of a very fine grade, and as it is almost a free gold there is very little expense in getting it out; but on account of various difficulties and high freight rates, due to inadequate transportation facilities, a quartz mine has a hard time trying to make both ends meet.

The only companies now working are the Gold Fields of Venezuela, an English concern which has not paid any dividends, but which is bringing in machinery and securing surrounding mines at low prices; and a French company, which is opening *La Experiencia* mine, situated between El Callao and Guasipati, with shafts and galleries, and expects to begin working in a few months.

The old El Callao mill is crushing some quartz for private parties and is working the sands with the cyanide process. The directors of this group of mines have at last adjusted all their difficulties with the Venezuelan shareholders and propose to reorganize with a French company. If they can get the \$500,000 working capital they ask for, there is no doubt but that there will be a boom in the interior, as with the marvelous discoveries of gold lately the outlook is bright.

**Concession for Railway to Gold Fields.**

Commenting on the foregoing report, Consul Thomas W. Voetter, of La Guaira, writes: "Consular Agent Henderson mentions the difficulties and costs consequent on a lack of transportation facilities to the gold-bearing regions. Information concerning a concession for a railway to this section was published in Daily Consular and Trade Reports on July 20, 1910. It has been stated that American capital is desired to build this road, rather than English. The fact that this line would approach the borders of a British colony may be the explanation for the reported preference. The recent discoveries of gold render this railway project of more importance than before and may tend to make the construction of a line to that section more certain."

---

**THE FORMOSAN BUDGET.**

[From Consul Samuel C. Reat, Tamsui.]

Formosa's revenue and expenditures for the fiscal year 1912 balance at \$22,662,754. Ordinary receipts are placed at \$19,028,580 and extraordinary at \$3,634,174. Ordinary budget outlays aggregate \$13,707,647. The extraordinary expenditures, aggregating \$8,955,107, include several enterprises of commercial importance. These latter appropriations embrace \$600,000 to be applied to irrigation works, \$489,000 for Takao harbor works, and \$378,500 for Taito railway construction. For new buildings at Taihoku hospital \$200,000 has been allotted, and much other construction and repair work is provided for.

The sum of \$25,000 is set aside for dredging Tamsui harbor, \$344,775 for Keelung harbor works, \$267,500 for Takao waterworks, \$80,000 for Kagi waterworks, \$100,000 for Tainan waterworks; \$475,000 is apportioned to the extension of the through railway and \$70,000 for double-tracking the Taikoku-Keelung line. Ship subsidies amount to \$506,966. The total sum apportioned to "industrial encouragement" is \$402,786, of which \$50,000 is to be spent in expanding the tea market, \$85,863 for the encouragement of silkworm culture, and large sums have been included for agriculture, stock-raising, forestry, and the fisheries. A special appropriation of \$675,000 was made for railway equipment.

---

**ARGENTINE MEAT FOR AUSTRIA.**

[From Consul J. I. Brittain, Prague, Austria.]

The Austro-American Steamship Co. was granted permission to import Argentine meat into Austria, and for that purpose chartered the *Gulf of Venice* to transport 700 tons of this meat, two-thirds of which was intended for Vienna and one-third for other large Austrian cities.

The meat arrived at Trieste in March. The board of directors of the municipal slaughterhouse at Prague bought 33,000 pounds of first-quality meat at 7.4 cents a pound and sold it to the local butchers at 11.2 cents a pound. This same price was charged butchers of other districts who ordered the meat through Prague. About 4,840 pounds of second-quality meat were purchased at 6.9 cents a pound and resold to butchers at 10.7 cents. The maximum retail prices were 14.8 cents for first quality and 13.3 cents for second quality.

**SEWAGE AND SEWAGE FARMS IN ENGLAND.**

[From Vice Consul Roger C. Tredwell, Burslem.]

The sewage works of this district are of considerable interest. There are six of these works in the county borough of Stoke-on-Trent, one of which is located in each of the federated towns. The bacterial system has been adopted by four of the plants, at the fifth a combination of the bacterial system and broad irrigation, and at the sixth the sewage is treated in tanks with ferrozone and afterwards discharged into polarite filters.

**Burslem, Fenton, and Hanley.**

At Burslem (population 43,000) the bacterial system consists of screen chambers in duplicate, fitted with power-driven screens, detritus tanks which have a capacity of one-twelfth the D. W. F., three open septic tanks, and two storm tanks. The bacteria bed covers an area of 20,200 square yards. The tank effluent is pumped into the bacteria beds, and is disposed of by rotary power-driven distributors. The effluent from the filters passes into a tributary of the River Trent. A pressing scheme is being considered for the disposal of sludge. This system is designed to deal with six times the D. W. F. of 800,000 gallons.

At Fenton (population 26,000) the bacterial system is designed to deal with twice the D. W. F. of 500,000 gallons on the bacteria bed area, the remaining volume up to six times the D. W. F. being dealt with on the contact beds. These are four in number with an area of 2,080 square yards. The plant consists of screen chambers in duplicate, four detritus tanks, four open septic tanks, and a bacteria bed with an area of 5,000 square yards. There are power-driven distributors drawn from end to end of the beds with an endless rope. There are contact beds for dealing with storm water and five sludge beds for sludge disposal. A portion of the land surrounding the works is used for irrigation and the effluent is discharged into a tributary of the Trent River.

Hanley (population 68,000) has a bacterial system arranged to deal with six times the D. W. F., estimated at 1,800,000 gallons. The plant consists of power-driven screens and chambers in duplicate, three detritus tanks, and eight sedimentation tanks arranged in two levels. The sewage gravitates to the lower tier and is raised by pumps to be treated in the higher tier. There is also an extensive bacteria bed on two levels with an area of 9 acres, on which power-driven distributors are drawn. The liquid after passing through the filters goes direct to the River Trent. The sludge is disposed of by pressers and about 375 tons of cake are produced each month.

**Longton, Stoke-on-Trent, and Tunstall.**

Longton (population 38,000) has a part bacteria and part broad irrigation system to deal with twice the D. W. F., which is estimated at 1,000,000 gallons on the bacteria bed area. The plant consists of a duplicate set of hand-operated screens and detritus chambers, four sedimentation tanks, and the bacteria bed on which power-driven distributors are used as at Hanley and elsewhere. The effluent after passing through the filters is distributed over 137 acres of the sewage farm. The total area of the farm is 281 acres, of which 210 acres are set aside for the irrigation of tank and filter effluents,

37 for storm water only, and the 34 remaining acres are not available for treatment as sewage. The crops on the farm are rye, grass, corn, and roots, with a large head of cattle.

At Stoke-on-Trent (population 36,000) the D. W. F. is estimated at 1,000,000 gallons, and the system in operation is by tank treatment of the crude sewage followed by intermittent downward filtration and by irrigation on 60 acres. The plant consists of sedimentation tanks and duplicate steam-driven pumps. On leaving the tanks the sewage is distributed through specially prepared beds by means of a hydraulic carrier and is spread over about 60 acres of land. The effluent is discharged into the River Trent. The crops produced on the farm are principally vegetables, roots, and hay.

At Tunstall (population 28,000) the sewage is treated in the tanks with ferrozene and afterwards discharged into polarite filters. The estimated D. W. F. is 500,000 gallons. Six circular bacteria beds have recently been built in order to cope with the total volume of sewage to be treated, which is 3,000,000 gallons. The plant consists of 2 rectangular and 4 circular septic tanks, 3 humus tanks, 10 polarite filters, and 4 circular filters. The effluent is discharged into a tributary of the River Trent.

#### High Yield of Mangolds.

At the adjacent town of Newcastle excellent results were obtained last year in growing roots on the sewage farm. Two acres in the storm-water area were sown with mangolds in April and 25 tons were secured. Another trial was given to yellow globe mangolds, but before they were sown the land was plowed in such a manner as to permit thorough irrigation from storm-water overflows. Although the land was not soaked with water, it was rendered sufficiently moist to admit of speedy germination. The estimated yield was over 200 tons, with an average of about 40 tons to the acre. The mangolds were grown without the aid of salt or artificial fertilizers, and were not only of excellent shape and very sound, but the roots were also large. Many measured over 36 inches in circumference.

---

### ATHLETIC CONTEST AS A TRADE PROMOTER.

[From Consul Joseph I. Brittain, Prague, Austria.]

The Bohemian International Athletic Contests and Drills are to be held in Prague during the closing days of June and the first of July, in which 15,000 people are expected to participate. About 2,000 are expected from the United States, and the contests will draw 300,000 to 500,000 people to this city at that time. If American exporters can get into communication with business members of the participating societies in New York, Chicago, and Omaha, they could doubtless have them represent some lines of American merchandise while here. Seating to accommodate 150,000 people is being arranged, and nearly all the hotel accommodations have been engaged for the occasion.

---

*An "everlasting match."*—Consul Horace J. Harvey, of Fort Erie, reports the manufacture in that Canadian city of a novelty lighter called an "everlasting match," a newspaper description of which will be loaned by the Bureau of Manufactures.

**SILAGE MACHINERY OPENINGS.**

[From Consular Agent Felix A. Dalmas, Carrara, Italy.]

**Tuscany Needs the Silo.**

Ensilage is practically unknown in this district, and it would require some time and patience to first interest the people and then teach them the advantages of feeding ensilage. The superficial study I have been able to give the subject shows that the need of the silo to the stock raisers and dairymen of this part of Tuscany is great. A brief outline of the situation will explain this.

The population of Tuscany is about 2,800,000, unevenly distributed over 9,287 square miles of very mountainous country. The two Provinces of Lucca (575 square miles area) and Massa-Carrara (687 square miles area) have a population of about 567,900, or 450 to the square mile, unevenly distributed in favor of the valleys and lowlands.

In other words, here in a land of mild climate, plentiful rains, and fertile land, cattle are kept on winter rations even in summer time. There are no large dairies nor cattle breeders in this immediate district, but there are many small dairy farms, and many producers interested in poultry, hogs, steers, oxen, etc., who, once they learned the economy and other advantages in feeding ensilage, would adopt its use.

With the exception of the foothills and some more or less level highland, the mountains are either barren or poor in soil. The valleys and the plains along the coast are very fertile and thickly populated. The fertile foothills are covered with olive and chestnut groves and vineyards. In the valleys and on the plains, in addition to the abundant grape, vegetables, wheat and other cereals, broom corn, and hay are grown.

Therefore there is little or no grazing land. Cows, steers, and the hundreds of oxen used in the marble and other industries, not to mention other beasts of burden, are kept housed and are fed on dry food the year round. If green food is fed, it probably does not exceed one-tenth. As a consequence the milk produced is very poor in quality and limited in quantity. A high percentage of the butter consumed is brought from the dairies of northern Italy. No good cheese is manufactured (excepting that made from sheep's and goat's milk by the shepherds high up in the mountains) and meat is of an inferior quality usually of overworked oxen killed unfattened.

[From Consul P. Emerson Taylor, Stavanger, Norway.]

**Complaint About American Goods.**

Two firms here state that there is a market for from 130 to 200 silage cutters per year and that all the machines now sold here are of English and Norwegian manufacture. They say the market is increasing each year, owing to the growth of the dairying industry of the district. One firm gave as the reason why no American machines are now sold here that two years ago an American silage cutter was purchased for trial, and that it gave excellent satisfaction, and that the firm thereupon purchased 20 more; that when the machines came it was found the knives were all too short and were for a machine of different size. After some correspondence and a long delay the American manufacturer sent larger knives, but this time they were for a larger machine and were entirely too long. Rather

than experience another delay, the firm took them to a local blacksmith and had them made to fit the machines. All this resulted in a cost to the firm of some \$50, and resulted further in giving the American machines such a reputation as made it impossible to place more of them on the market. The firm's loss, it is stated, was paid in part by the manufacturer. Of the 20 machines 18 have been sold, and the firm still has 2 of them.

**Demonstrations of Machinery—Difficulties to be Overcome.**

These two firms both inform me that their method of introducing any farm machinery, especially new farm machinery, is to place one of the machines with one of the leading farmers of the district and make a demonstration of its work, and if it is successful little difficulty is experienced in placing many of the machines in the farming district. This was done in the case of the machine in question, the first machine giving the best of satisfaction; but the evident subsequent blunder nullified all the good results of the first test.

The experience of this firm has been duplicated by other firms in this district more than once during the past year in their experience with other American firms. It is the one thing most discouraging of all to a consul trying to extend the sales of American machinery. There are other difficulties that must be overcome, such as refusal of the American firms to extend the same credit as English and German firms, which results in the necessity of the local firms paying for the machinery sometimes weeks before they see it; the difficulty of securing repairs when the machine breaks; the inconvenience of ordering through some agency in London or Hamburg, and others. But these are difficulties that can be overcome. One experience, however, such as this firm had, usually ends its American purchases and, as in this case, discourages all the other firms of the city from risking a similar experience with the sellers of American machinery.

It would seem that the foreign department of every American firm should realize that it is at least ten times as difficult to correct an error made in a foreign shipment as one made to a firm located merely at the other end of a local or long-distance telephone, and that therefore several times as much care should be exercised in the filling of the foreign orders.

[A previous series on sale for silage machinery appeared in Daily Consular and Trade Reports for January 17, 1912.]

---

**NEW OIL FIELD IN ONTARIO.**

(From Consul James M. Shepard, Hamilton, Canada.)

The first high-grade oil found in the Trenton rock in paying quantities is reported at Milton, Halton County, Ontario, on the property of Brandon's brick works, 1,400 feet below the surface. The test well is said to contain 950 feet of oil, which in its crude state is a first-class lubricant. Oil men are rapidly securing lease options on surrounding lands, and already derricks are up and drilling operations commenced. Trade opportunity for oil machinery is open.

---

*Matches* used in Paraguay are nearly all of domestic manufacture. Consul Ferris states that they are mostly of wax and retail at seven-tenths of a cent to 1½ cents per box of 40 to 50.

## THE PORT OF GLASGOW.

[From Consul J. N. McCann, Glasgow, Scotland.]

The affairs of the port of Glasgow were conducted by the municipality until the beginning of the nineteenth century, when the municipal authorities formed themselves into a separate body as trustees for the Clyde navigation. Since that time several changes have been made by the addition of representatives of the commerce of the port and of the counties and small towns along the river, and the number of trustees at present is 42. Ten are nominated by Glasgow Corporation, 6 represent the Chamber of Commerce, Merchants' House, and Trade House, 8 are sent by the counties and small burghs, and 18 are chosen by the harbor-dues payers.

Under the constitution of 1858 the trustees were empowered to form the quays and other facilities of a port, and also to deepen, straighten, and widen the river. The result has been that that which was theretofore a narrow and shallow stream can now accommodate with safety steamers carrying 12,000 tons of cargo and drawing 30 feet of water.

In addition to the quays along the banks of the river itself, there are four tidal basins, namely, Kingston, Queens, Princes, and Rothesay Docks. The quays are founded for the most part on concrete caissons sunk 60 feet below the level of the dock. The rise and fall of the tide is 12 feet. At low water the depth of the water is 24 feet.

### Harbor Facilities—Commerce of the Port.

The wharves are well equipped with modern facilities for the rapid handling of cargo, and tramways connect them with the principal railroads of Scotland. The cranes, operated by hydraulic, steam, or electrical power, lift weights up to 150 tons. The trustees own three dry docks, and are about to construct at Renfrew another which will probably be the largest in the world. They also own several powerful dredges and a large fleet of hopper barges, the repairs to which are made in the trustees' workshop. Among the numerous ferryboats there are three for vehicles, which are conveyed across the river on platforms always maintained at the level of the quay according to the tides.

Such port facilities have naturally occasioned vast expenditures. During the past 100 years the authorities have spent almost \$50,000,000, but the debt outstanding is only about \$35,000,000, the balance having been paid out of the revenue of the port. To provide for future additions to docks, the trustees have taken title to 400 acres of land having a frontage of about 2 miles along the river. The quays of the port, which 50 years ago were  $2\frac{1}{2}$  miles in length, are now 12 miles.

The commercial progress of the port of Glasgow is perhaps shown most clearly in the revenues of the trust and in the tonnage of the vessels and goods. Fifty years ago the annual revenue was \$476,900; in 1911 it was over \$2,807,970, the highest in the history of the port. The total tonnage of goods half a century ago was 1,000,000 tons, while now it is 12,000,000 tons. The total tonnage of vessels using the port then was only 3,000,000; at present it is more than 12,000,000. The principal articles dealt in at the port are: Exports—coal, iron, steel, and machinery; imports—grain, flour, fruits, timber, and

minerals. The total tonnage of the goods exported forms 60 per cent, and imported 40 per cent. The foreign traffic is 62 per cent of the whole, the rest being coastwise.

### AN ENGINEERING SCHOOL IN TURKEY.

[Condensed report from the Levant Trade Review, Constantinople, published by the American Chamber of Commerce for the Levant.]

Robert College, the American institute of learning in Constantinople, has added an engineering department, under the direction of John R. Allen, M. E., from the United States. Prof. Allen states that the course will be strong along mechanical and electrical lines, with options in civil engineering, such as surveying, steel structures, railroad construction, water-power development, and irrigation. The new engineering building is now being constructed, the first wing being four stories high and 55 by 115 feet. The forge shop will have down-draft forges, blown by an electric fan, and a cut-off shear and punch. The second floor will contain the foundry. The cupola for melting iron will be in the court and have a spout entering the foundry room. The foundry will be arranged for both floor and bench molding and equipped for making brass castings as well as iron. On the third floor will be the machine shop, with an engine lathe, a gap lathe, speed lathe, drill press, large planer shaper, and Brown & Sharpe universal milling machine, including all necessary tools and attachments, each group of these tools driven by a separate electric motor.

The power will be obtained from a central power house. The boiler house is being constructed and will contain two 150-horsepower boilers, with room for a third boiler to be installed later. These boilers will furnish the steam for the electric-lighting engines and for the heating system.

The east wing of the engineering building will be the same size as the west or shop wing. This wing will contain the power plant, experimental steam, electric and hydraulic laboratories and the drawing rooms. The first floor will be used for the power plant, consisting of one 75-kilowatt 60-cycle 3-phase 220-volt alternating current, driven by a 4-valve engine, and one 25-kilowatt generator, driven by a single-valve high-speed engine. This machinery will be available for instructing the student in the operation and testing of a power house. On this same floor will be the larger gas engines and the hydraulic laboratory. In the basement will be the feed pumps and condensing apparatus. The second floor forms a gallery for the first floor. The smaller gas and gasoline engines, the experimental electric motors and generators and all work of calibration will be done on this gallery. The third floor will be devoted to calibration of instruments, computing rooms, special laboratories, and offices. The top floor will be used for drawing rooms, lecture rooms, museum, library, and recitation rooms. This building will be built as soon as the growth of the department makes it necessary.

In addition to the strictly engineering work it is proposed to establish classes in manual training for the younger boys. This will stimulate the interest in mechanics among the younger boys, besides giving them some knowledge of the processes of manufacture.

The woodworking and pattern department on the fourth floor will be equipped with a planer, a surfacer, a rip and crosscut saw, band saw, two speed lathes, a universal trimmer, and a molding and mortising machine. Each machine will be driven by its own direct motor.

### NEW GOVERNMENT PUBLICATION.

Senate document 338, which contains the "Report of the Employers' Liability and Workman's Compensation Commission," is for sale by the Superintendent of Documents, Government Printing Office, Washington, D. C., in two volumes. Volume 1 consists of 214 pages, and contains the message of President Taft and report of commission with index analysis; price, 15 cents. Volume 2, 1,495 pages, contains hearings and briefs with tables of cases and general index; price \$1 (and not 15 cents as stated in Daily Consular and Trade Reports for May 13).

*The new Chilean dreadnought Santiago, of 27,000 tons, has been ordered from shipyards at Elswick, Newcastle; it will carry 14-inch guns.*

**ICE SKATING RINKS IN GREAT BRITAIN.**

[From Consul General John L. Griffiths, London.]

The first ice skating rink in Great Britain was opened at Southport in 1875. The same system was used then as obtains now for the manufacture of the ice. However, the expense was considerably greater, and, as a result, the rink was closed in 1877.

There have been three such rinks in London, Hengler's, opened in 1894 and closed in 1899; the Niagara, also opened in 1894, and closed in 1899 or 1900; and Prince's. The rinks now in operation are, in order of date of opening: Prince's, in London, opened 1895; a rink in Glasgow, opened 1906; one in Manchester, opened 1910; and one in Edinburgh, opened 1912. The London rink is run by a private club, while all the others have been and are managed by companies.

The membership dues of Prince's are calculated so that there may be a sufficient income to defray operating expenses. The following is a schedule of the fees and subscriptions of members:

	Full season.	Half season.
Men.....	\$61.32	\$35.76
Ladies.....	51.30	30.66
Two members of one family living in the same house..... each..	40.87	30.66
If more than two members, each additional member.....	35.76	25.54
Nonskating members.....	25.54	15.33

A monthly skating membership costs \$15.33. The skating season lasts from October to April, while the half season under the above schedule is considered to be from October to January 20, or from January 20 to April. The rinks in Glasgow, Manchester, and Edinburgh, operate approximately during the same months. There has been no movement as yet to keep the rinks open for skating during the summer months, so that the problem of insulating the ice against heat does not arise.

**FRENCH CAMPAIGN AGAINST AMERICAN SHOOKS.**

[From Deputy Consul General Bartley F. Yost, Paris.]

The Chambre Syndicale de l'Emballage, an organization of French box makers and packers, and the Chambre Syndicale de Bois de Sciage et Industrie (Saw and Industrial Wood Union) are conducting a vigorous campaign against the admission of shocks of American origin which arrive in a knocked-down state, with a view to securing legislation imposing an increased duty on all American cases landed in France and destined for return to the United States filled with French merchandise.

There are said to be 16 American exporting firms in Paris who use American shocks more or less regularly.

[American official records show the following exports of shocks and staves from the United States to France during the last five fiscal years (ending June 30): 1907, \$1,857,538; 1908, \$1,994,182; 1909, \$1,670,924; 1910, \$1,324,874; 1911, \$1,125,334.—B. of M.]

The results of weathering and spontaneous heating of coal experiments conducted by the Bureau of Mines are reviewed in its forthcoming annual report.

**OCEAN FREIGHT RATES FIRM.**

[From Consul General E. D. Winslow, Copenhagen, Denmark.]

Rates for cargoes keep very firm the world over; business is brisk, and tonnage is in demand. For April-May loading charters have been made from Bombay to the United Kingdom at \$6.69 up to \$6.87 per ton, with option to Hamburg 12 cents extra, and to Havre or Dunkirk 24 cents extra. From Black Sea ports good prices prevail; from Odessa to Hamburg, \$3.28 to \$3.40.

Mediterranean ports are paying especially good rates for prompt shipment, while offerings of tonnage are light. Grecian tonnage has paid \$2.07 to Rotterdam and \$2.80 to America. There have been some salt charters to British North America at \$2.55 to \$2.68. Rates from Huelva to America are quoted at \$2.80 to \$2.85 per ton. Plate River rates are also good, and prompt tonnage from the "Bar" Buenos Aires commands \$6.45 to \$6.57 for the United Kingdom.

The American freight market shows the quietest condition of all the centers. Some inquiry has been felt for coal cargoes, but rates are quoted as merely steady. The freight rates being paid for coal tonnage from the Welsh coal fields are as follows: To west Italian ports, \$1.82 to \$1.95; Port Said, \$1.82; Venice, \$1.95; La Plata, \$3.53 to \$3.65; Montevideo, \$3.40 per ton.

---

**NEW BRITISH MOTOR VESSELS.**

Several motor vessels of new types have just been launched from Scottish shipyards. A triple-screw tunnel motor ship, floated at Troon, is intended for the service of the British consul in the Kongo. The vessel is 110 feet in length and draws only 3 feet of water when loaded. It will be propelled by three sets of Kromhout paraffin motors, driving screws in three separate tunnels, and designed to give a speed of almost 10 knots. It is claimed that it is the first triple-screw tunnel vessel yet built for propulsion by motors.

A motor barge for service on the Forth and Clyde Canal has been launched at Grangemouth. It also will have Kromhout engines. Another interesting motor vessel is a twin-screw launch of 55 tons, which was floated at Whitinch, for missionary work at Calabar in connection with the United Free Church of Scotland. This vessel has Kelvin motors of 60 brake horsepower, designed to give a speed of nearly 10 miles an hour.

---

**Spring and Tire Inventions.**

Consul General James A. Smith, of Genoa, has transmitted descriptions and blue prints of a recent Italian invention covering (1) a spring axle for heavy motor trucks and omnibuses; and (2) elastic plates for use on lighter motor vehicles. The first is intended to do away with the costly solid tires on heavy vehicles; the second, to replace pneumatic tires on lighter cars. The documents mentioned will be loaned to interested firms by the Bureau of Manufactures.

The Korean Young Men's Christian Association has established a shoemaking department in its industrial school at Seoul, and Consul General George H. Scidmore suggests that those interested correspond with its secretary, P. L. Gillett.

**INTERNATIONAL COMMERCIAL CONGRESS AT BOSTON.**

Supplementing the information relative to the sessions of the Fifth International Congress of Chambers of Commerce which appeared in *Daily Consular and Trade Reports* on March 19, 1912, the chairman of the Boston executive committee states that Prof. F. W. Taussig, of Harvard University, an authority on economics, has been appointed chairman of the American committee on program that is drawing up the list of commercial topics of international importance which the business men of the United States will submit for discussion at the congress. The final program of the congress (which meets in Boston Sept. 24 to 28) will be settled by the permanent committee after receiving suggestions from all countries. The meeting of this committee will be held at Brussels during the latter part of June. Prof. Taussig will attend as American representative.

For the convenience of delegates coming from other countries, the Boston Chamber of Commerce has arranged for special steamer transportation to that city. One hundred berths have been reserved on the *St. Louis*, sailing from Southampton and Cherbourg September 14, and 25 berths on the *Kroonland*, sailing from Antwerp and Dover on the same date.

---

**POSSIBILITIES OF INDIAN COTTON CROP.**

In a preliminary report on his recent (second) journey to India to further investigate the possibilities of cotton growing in that country Mr. Arno Schmidt, of Manchester, England, the secretary of the International Cotton Federation, states that the cotton crop of India this year will be smaller than last, which is due to prolonged drought in the western districts, but reliable statistical information as to the crop is not obtainable.

There is not the least doubt, Mr. Schmidt adds, that the cotton crop of India can be doubled without interfering with the growing of food supplies. This is the opinion of several experts, and notably of the imperial cotton specialist of India. In his opinion the yield per acre has already increased, and is gradually improving. The extension of irrigation in several Provinces, which is making rapid progress, is another means of enlarging the area under cotton, and notably of long staple cotton.

---

**Agricultural Progress in India.**

Sir John Hewett, in his address at Lucknow, India, on March 30, to the United Provinces Legislative Council, stated that the interest elicited in the agricultural court of the Allahabad Exhibition [described in the *Daily Consular and Trade Reports* for Nov. 5, 1910], is the most encouraging sign that has been met with in the endeavor to introduce modern agricultural machinery. The progress in the substitution of improved implements of agriculture has been slow, but the officer learns that the attitude of the upper and middle classes toward improvement is substantially changed. This influence through the landlord is considered most hopeful.

## INDUSTRIAL PROGRESS OF MANITOBA.

[By Consul General John E. Jones, Winnipeg.]

While western Canada showed marked progress during 1911, business conditions, which gave great promise at the beginning of the year, proved disappointing. The grain crop was the largest ever gathered in the Canadian West, but it was not as favorable as had been hoped for, and its value was considerably reduced by early frosts, which damaged the oat crop particularly. Much grain was also spoiled by heavy rains during the harvest period.

### Grain Movement a Growing Problem.

After bending all their energies to supplying the West with coal, because of the great strike of the miners in western Canada, the railroads found themselves unable to handle the grain crop in the short time allotted, although the amount of grain moved in the time allowed exceeded that of any previous year. A serious blockade occurred and all the elevators at Fort William, Port Arthur, and throughout western Canada were soon filled. Being unable to move the grain to eastern Canadian points for export, the farmers sought relief by shipping it through the United States.

The prairie Provinces devote all their cultivated area to grain, and while only 7 per cent of their arable land is under cultivation, the question of the profitable disposal of the annually increasing yield is challenging the serious thought of Canada's greatest economists. When western Canada produces 600,000,000 bushels of wheat, as is predicted for 1915, the condition will be serious. The population of this region is increasing more rapidly than the railroad development, and if immigration continues at even the rate of the past few years the railroad facilities will be inadequate to handle the enormous crop.

With the restricted market to the south, the Canadian farmer now finds Europe the only practical outlet for his wheat. Some expect that upon the completion of the Hudson Bay Railroad a large part of the export grain will find its way to Europe through Hudson Bay, but from careful consideration of the subject it appears that the western crop will be divided, a large part going to Europe from

western ports through the Panama Canal, while the rest will go east to Montreal and other Atlantic ports.

#### Shipments of Grain.

The Lake Shippers' Clearance Association reports that 61,365,722 bushels of grain were transported through the ports of Fort William and Port Arthur, as compared with 47,389,682 bushels in 1910. The number of vessels loaded in 1910 was 429 and in 1911, 491. There were 101 grades of wheat, 25 grades of oats, 10 grades of barley, and 4 grades of flax handled, and the 1911 shipments were made up of 47,633,639 bushels of wheat, 11,518,982 bushels of oats, 1,403,835 bushels of barley, and 809,266 bushels of flax. Of these amounts, the consignments to ports of the United States were as follows: Wheat, 24,777,025 bushels; oats, 774,566 bushels; barley, 784,771 bushels; and flax, 506,705 bushels. Over 100,000,000 bushels of wheat were inspected at Winnipeg in 1911.

The total shipments of grain by vessel during the 1910-11 season amounted to 77,209,808 bushels and the rail shipments to 4,855,821 bushels.

The following table shows the grain production in the three prairie Provinces in 1911:

Grain.	Manitoba.	Saskatchewan.	Alberta.
	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
Winter wheat.....	85,000	758,000	8,011,000
Spring wheat.....	60,190,000	66,907,000	28,132,000
Oats.....	57,893,000	97,962,000	56,964,000
Barley.....	14,447,000	5,445,000	4,151,000
Flax.....	1,123,000	10,688,000	973,000

Alberta has no competition in the growing of winter wheat, although this grain has been successfully grown on a small scale in the other Provinces. Manitoba leads in the production of barley and Saskatchewan in spring wheat, oats, and flax.

#### Immigration.

Of the 351,000 immigrants who entered Canada during 1911, 180,000 came from the United Kingdom, 130,000 from the United States, and the rest from Europe, principally from Belgium and Austria-Hungary. The quality of the immigrants has continued to improve, not only in the physique of the new settlers, but in their worldly possessions. It is estimated that the immigrants from the United States last year brought with them cash, securities, stock, implements, and household effects to the value of \$135,000,000.

The immigrants from the United States have settled chiefly in western Saskatchewan and in central and southern Alberta, at least 80 per cent having settled in the latter Province. New areas, extending 250 miles north from the boundary line, have been opened for homestead and preemption, and the outlook for immigration is regarded by competent authorities as most satisfactory. Present indications show that the high-water mark of European immigration attained in 1911 is certain to be exceeded in 1912, while the reports received from the Canadian Government agencies in the United States indicate an increase of American immigration in 1912 of nearly 30 per cent over 1911. The immigration from the United

States in October, November, and December, 1911, showed a gain of 25 per cent over the same period in 1910.

#### **Area of the Prairie Provinces.**

The area of the Provinces of Manitoba, Saskatchewan, and Alberta is estimated at 334,894,320 acres, of which 153,797,984 acres have been surveyed. In the three Provinces there are no less than 3,260,509 acres of land reserved for road allowance purposes. There are 486,311 acres of parishes and river-lot settlements in Manitoba, 81,974 acres in Saskatchewan, and 96,603 acres in Alberta. The area of forest reserve is gradually increasing and is now computed at 3,277,562 acres, there being 2,452,960 acres in Manitoba, 599,642 acres in Saskatchewan, and 224,960 acres in Alberta. The pressing need of reservation in Manitoba is responsible for the greater amount in that Province. These figures do not include the Rocky Mountain Reserve of 11,656,320 acres.

The area of Indian reserves is estimated at 2,729,558 acres and the total area under homestead, preemption, and purchased homestead entry in the three Provinces is at least 55,611,520 acres. These latter are chiefly even-numbered sections. The railway companies have been granted 31,864,047 acres, chiefly in odd-numbered sections, in these Provinces. The total area of school lands endowment, exclusive of unsurveyed lands, is 7,963,254 acres. The Hudson's Bay Co. holds grants of 6,575,400 acres and the area otherwise disposed of, including northwest half-breed scrip, military scrip, Manitoba swamp lands, and sales and irrigation lands, amounts to 11,952,853 acres.

The total area of this land under cultivation in 1910 was 13,823,900 acres, of which 7,960,400 acres was devoted to wheat. In 1911, the area under cultivation in Manitoba was 5,318,989 acres, in Saskatchewan 7,436,560 acres, and in Alberta 1,808,719 acres. The Canadian census bureau estimated the population of Manitoba as 540,121, of Saskatchewan as 425,927, and of Alberta as 373,113, on March 31, 1912.

A large part of the remaining unsurveyed land has as yet been only partially explored, but from what is now known of its character the area available for some form of agricultural work is estimated as 10,000,000 acres in Manitoba, 18,000,000 acres in Saskatchewan, and 60,000,000 acres in Alberta. With the addition of 10,000,000 acres to be added to Manitoba, the total reaches 98,000,000 acres. Allowing for the inferior quality of this unsurveyed area, this should represent an area of farming land fairly equal in productiveness to the present settled area.

The total area set apart as endowment in the three Provinces by the Dominion lands act amounts to 23,629,387 acres, of which 7,963,254 acres have been surveyed. Of this 1,633,955 acres have been sold, at an average price of \$11.47 per acre. Saskatchewan received the highest average price per acre, with Alberta second.

#### **Growth of Railroads and Banks.**

During 1911 something like 800 miles of new railroad were opened and operated in the Provinces of Saskatchewan and Alberta alone, and the estimates made by the three railroad companies engaged in constructing branch lines indicate that the mileage constructed dur-

ing 1912 will be as great or greater. Vast tracts of new land, stretching 200 miles north from the boundary line into Alberta and Saskatchewan, will be penetrated by railroad lines this year, accommodating the thousands of American homesteaders who have settled there.

The railway mileage in Manitoba rose from 1,470 miles in 1893 to 3,526 miles in 1910; in Saskatchewan from 748 miles to 3,350; and in Alberta from 807 miles to 1,774 miles in the same period. The mileage at the end of 1910 was divided among the different companies as follows:

Companies.	Mani- toba.	Saskatch- ewan.	Alberta.
	<i>Miles.</i>	<i>Miles.</i>	<i>Miles.</i>
Canadian Pacific.....	1,529	1,750	1,370
Canadian Northern.....	1,531	1,183	219
Grand Trunk Pacific.....	304	417	255
Great Northern.....	162		

The number of banks in these three Provinces has greatly increased since 1911, the number in Winnipeg having risen from 14 in 1901 to 43 in 1911; in Regina, from 2 to 10; in Calgary, from 4 to 18; in Edmonton, from 2 to 16; in Medicine Hat, from 1 to 4; and in Saskatoon, from none to 12. In the same period the number of banks in Montreal rose from 38 to 81, and in Toronto from 40 to 140. The bank clearings of Winnipeg in 1911 amounted to \$1,170,000,000.

#### Manitoba's Merchant Marine.

Although a number of vessels have been employed for many years in transporting fish and wheat from Lake Winnipeg and the Red River, it was only with the completion of the locks at St. Andrews, 18 miles from Winnipeg, that Manitoba's merchant marine assumed importance. At present 37 registered craft, of 5,069 gross tons, are engaged in this traffic.

In 1911, 347 vessels, of 109,344 gross tons, passed through the St. Andrews locks, as compared with 179 in 1910. They carried 5,350 passengers, 513 tons of merchandise, 1,748 tons of lumber, 3,345 tons of cordwood, 14,659 tons of sand, 18,000 tons of stone, and 194 tons of coal. The tonnage passing through the locks in 1911 was valued at \$123,980, including raw products to the value of \$72,255 shipped from the lake to the Winnipeg market. One shipment of 7 tons of butter, valued at \$1,750, came down from the new settlements northwest of Gimli shortly after the opening of navigation. The total outgoing commercial traffic of Lake Winnipeg during 1911 is estimated at \$765,255.

The navigation of the Red River officially closed October 15, and the locks of St. Andrews were put out of commission for the winter. Lake Winnipeg is usually frozen over by November 15, and in 1911 13 large ships were caught in the ice. A request to the Government for an ice breaker for the lake brought a promise of relief. In order to lose as little time as possible, the fishermen are not sent to their camps until late in the fall, which keeps navigation late. It is estimated that the commercial traffic along the river and lake in 1911 was nearly 50 per cent greater than that of any previous year, and all of this increase is attributed to the use of the locks at St. Andrews and the use of the Red River. The need of the traffic now is the

improvement of the Red River at Winnipeg by dredging and the erection of docks. The Government has five dredges on the Red River and Lake Winnipeg service, and work has been done at various points.

#### Mixed Farming Needed in Western Canada.

Western Canada presents the peculiar anomaly of a wonderfully productive agricultural country importing most of its food products. Although the prairie Provinces have a most productive soil, capable of producing nearly all kinds of farm produce, they have not been able, for the past 10 years, to supply the demands of their population, as the single purpose of the western Canadian farmer seems to be to produce as much wheat as possible. Strenuous efforts were made during 1911 to awaken the farmers to the value of mixed farming, and these have not yet proved successful.

No statistics are available showing the enormous importation of foodstuffs from the United States and eastern Canadian points, but most of the poultry and eggs used in western Canada come from the eastern Provinces and the United States, and the larger cities of western Canada yearly face a dearth of dairy products. During 1911, the milk shortage in this region became so acute that the border States of the United States were called on to supply the deficiency. It is estimated that the imports of milk for Winnipeg during November, December, January, and February averaged \$45,000 a week in value. The United States was also called upon to supply potatoes; although these are the most productive crop in western Canada, they were not raised in sufficient quantities to meet the demand.

With a population of 1,700,000, according to the last census, it can be readily seen from the figures following that western Canada is not producing enough vegetables, dairy products, etc., to supply its immediate needs. It is dependent upon outsiders for millions of pounds of bacon and mutton, and for weeks at a time the Winnipeg market has been supplied almost entirely with chilled mutton from Australia or frozen mutton from Prince Edward Island.

During 1911 the Provinces of Manitoba, Saskatchewan, and Alberta produced 11,141,207 pounds of butter, valued at \$2,573,671, and 660,725 pounds of cheese, valued at \$84,691, as compared with 10,066,759 pounds of butter and 1,121,258 pounds of cheese in 1910.

The quantity and estimated value of the crops of potatoes, hay, etc., in the Provinces of Manitoba, Saskatchewan, and Alberta for 1910 and 1911 are shown in the following table:

Crops.	Quantity.		Value.	
	1910	1911	1910	1911
Potatoes.....bushels..	7,781,000	14,044,000	\$4,743,000	\$6,303,000
Turnips, etc.....do.....	1,850,000	8,247,000	826,000	2,931,000
Hay and clover.....tons..	215,000	539,000	2,429,000	5,892,000
Sugar beets.....do.....	25,000	15,000	125,000	75,000

<sup>1</sup> Alberta only.

#### Live Stock Shipments.

While western Canada has been able to meet in a small way the demands of its people for beef, the disappearance of the great cattle ranges will soon force the importation of beef. A large amount of

mutton and pork products are imported each year from the United States and England and from the eastern Provinces and Prince Edward Island. Alberta did better during 1911 in its shipments of cattle, and at a meeting of the live-stock shippers and railway representatives at Winnipeg in December the Alberta delegates showed that at least 30,000 head of cattle were shipped to British Columbia during the year. The loss of the export trade was largely offset by the rapid development of the home market, and Alberta found more profit in shipping cattle to the Pacific coast than to the Atlantic ports.

The steady decline in the number of hogs received at Winnipeg from 145,269 in 1908 to 85,157 in 1911 is most unsatisfactory, in view of the fact that the Winnipeg packing houses have never received enough animals to employ their full capacity. The price for the year, while below that of 1910, was profitable, averaging \$7.71 per 100 pounds. The highest price, \$8.80, was paid in September, and the lowest, \$6.85, in May.

The receipts of sheep increased from 30,775 in 1910 to 43,614 in 1911, but there was no increase from western Canada, as the additional sheep were brought from St. Paul and Minneapolis. The price averaged \$4.89 for the season.

The shipments of horses into Winnipeg for western points amounted to 26,072 head, a decrease of 7,499 from 1910, the record year. While western Canada has been breeding horses for some time, the industry has become extensive only within the past five years. As it requires four years to produce salable horses for farm or railway work, the first shipment of marketable western horses was ready in the spring of 1911. It is impossible to furnish accurate figures as to the importation of horses, but thousands are brought from the United States each year to work on Canadian farms.

#### **Production of Flour—General Exports to the United States.**

It is impossible to obtain complete returns as to the amount of flour manufactured from western wheat and shipped abroad, but 1,436,802 barrels of flour were exported directly from the West to foreign countries, as against 3,228,500 barrels in 1910. Of this amount, 24,470 barrels were shipped to China, 2,620 barrels to Japan, and 500 barrels to Fiji, these being sent by way of Pacific ports. About equal amounts of the balance were shipped to the United Kingdom and the Continent, the latter proving a fair market for low-grade flour. The falling off in the export trade has been largely offset by the increased domestic consumption. Over 1,250,000 barrels of flour were manufactured by interior mills for local consumption. Several of the larger mills report heavy sales of mill stuffs to the United States, Germany, Holland, and Denmark, the principal articles sold being bran. Denmark continues to buy bran from western Canada to feed her dairy cows and ship butter in return to Montreal and even to Winnipeg, while the western farmer continues to assure the public that it does not pay him to feed bran to his cows, even when the retail price of butter is 40 cents a pound.

Practically no barley was exported from this consular district in 1910, but the high prices prevailing in the United States during the latter part of 1911 permitted the Canadian shippers to realize a good profit after the payment of duty and freight and resulted in the ship-

ment of barley to the value of \$315,056. Nearly all other grains and their manufactures showed material decreases during 1911. The scarcity of beef cattle in western Canada during the early part of 1911 caused a decrease in the exports of hides during that period, which was overcome by a great increase during the fall, giving a net increase over the preceding year of \$221,440. Notwithstanding the great quantity of fish exported in 1910, the exports of fish in 1911 showed an increase of \$111,594. Material increases were also noted in pulp wood and butter. The butter shipped from this district is, as a rule, of inferior quality, and is shipped to the United States to be worked over and then exported. The exports of furs declined \$252,576 in 1911, owing to the large amount of furs exported during the previous year and also to the disturbed condition of the European fur markets.

#### Declared Exports.

The values of the principal exports to the United States, as invoiced at this consulate general and its consular agencies during 1910 and 1911, were as follows:

#### Growth of Western Canadian Cities.

The real estate men of western Canada are considering plans for the control of real estate speculation, as subdivisions which can not possibly materialize into building centers are being put on the market and extensively advertised. Such speculation acts as a drawback to western Canada. Calgary, Alberta, leads the cities of

the prairie Provinces in the amount of money spent for building, while Moose Jaw, Saskatchewan, showed the highest percentage of increase. Although 1910 was a year of great building activity in Winnipeg, 1911 showed an advance of \$2,500,000. The following table gives the assessment valuations and building expenditures of 11 of the leading cities of western Canada during 1910 and 1911:

Towns.	Assessment valuation.		Building expenditures.	
	1910	1911	1910	1911
Brandon.....	\$9,573,740	\$12,415,310	\$1,224,385	\$1,108,129
Calgary.....	30,796,092	52,747,600	5,589,594	12,709,478
Edmonton.....	30,106,110	46,494,740	2,161,356	3,797,526
Lethbridge.....	9,603,365	11,906,555	1,211,310	1,033,980
Medicine Hat.....	4,134,094	.....	427,140	450,000
Moose Jaw.....	16,090,383	20,006,090	1,071,080	2,475,736
Portage la Prairie.....	4,895,133	5,300,388	362,500	300,000
Prince Albert.....	6,018,687	10,362,532	662,475	921,145
Regina.....	18,211,960	24,840,733	2,416,288	5,068,110
Saskatoon.....	10,571,215	23,392,528	2,817,771	4,920,000
Winnipeg.....	157,608,230	172,677,250	15,116,450	17,600,000

In 1911 Calgary had 20,000 miles of pavement, Edmonton 6,270, Moose Jaw 1,700, Regina 13,500, St. Boniface 16,060, and Winnipeg 144,540.

#### Municipal Ownership in Winnipeg.

Early in its development Winnipeg took up the practice of owning its public-utilities plants and now claims to have made the longest strides along the line of municipal ownership of any city in the New World. The city has grown from a population of 215 in 1870 to 135,000 in 1911.

The greatest municipal enterprise of the city is its power plant, which commenced the supplying of electric current for light, heat, and power in the latter part of 1911. This plant is located at Point du Bois, on the Winnipeg River, 77 miles northeast of Winnipeg, and cost about \$4,000,000. A water fall of 32 feet has been increased to 47 feet by the power development dam, which retains a reservoir of 6,000 acres. The total horsepower available without storage is 60,000, which can be increased to 100,000 horsepower. The opening of this plant gave a great impetus to the industries of Winnipeg, which have increased their output from \$18,983,290 in 1906 to \$36,000,000 in 1910.

A supply of nearly 15,000,000 gallons of excellent water every 24 hours is obtained by the municipal plant from seven artesian wells. There are indications that a larger supply will soon be needed, and the possibilities of obtaining a permanent and sufficient supply from some of the lakes about 60 miles from the city, or from the Winnipeg River, are being investigated. City water is sold at the rate of \$1.50 per quarter for four rooms, with a 30-cent increase for each additional room, and a 5 per cent discount for prompt payment. A high-pressure plant for fire protection furnishes water from the Red River under 300 pounds pressure, with a special set of pipes laid in the business center of the city.

The city owns an asphalt plant, a stone quarry, and a plant for laying granolithic walks. Winnipeg has paved 70 miles of its streets, of which the principal ones are nearly 150 feet wide, with asphalt. Under municipal ownership, heavy asphalt pavement is laid at a cost of \$2.85 a square yard. Other grades are laid for \$2.50 to \$2.85 a

yard. The city is about to adopt the asphalt-macadam type of pavement, which can be laid for 90 cents a square yard. There are 100 miles of granolithic walks in Winnipeg, all laid by city workmen and made largely of material from the municipal stone quarry, which has an annual output of about 75,000 cubic yards of crushed stone. In 1906 the city decided to establish a municipal gas works, but this has not yet been done.

The big event of the summer in Winnipeg is the provincial exposition held for a week or more each July.

#### **Future Prospects.**

While Winnipeg still leads the western cities in point of influence, population, and wealth, it is believed that the next few years will show a difference in favor of Vancouver. Winnipeg's claim to consideration lies in the fact that it is the center for five railroads and numerous branches, which radiate into all parts of the western country. It is really the clearing house for western Canada; but gradually, as the population of the West increases, some other city or cities must take its place. It is generally predicted that, with the completion of the Panama Canal, Vancouver will be the great city of western Canada, for there is little doubt that the West will attract a largely increased amount of trade to its shores with the opening of this great waterway.

Winnipeg advances as the grain crop increases, and while the farmers of western Canada had serious obstacles in every way in harvesting their 1911 crop, Winnipeg did not feel the financial situation that was generally expected. To-day, however, the great implement dealers who supply machinery for the western farmers are carrying millions of dollars in promissory notes. Collections during the year, while they promised well, fell off greatly as the season advanced and crop conditions became worse.

Great efforts are being made by those interested in the city's welfare to make Winnipeg a manufacturing center, and at the close of 1911 Winnipeg had 267 manufacturing establishments, with an invested capital approximating \$35,000,000, employing upward of 15,000 hands, with a monthly pay roll of \$750,000. The estimated output of Winnipeg's industries in 1911 was \$40,000,000.

#### **NOTES FROM SOUTH AFRICA.**

[From Consul E. A. Wakefield, Port Elizabeth, Cape Province, Apr. 15.]

*Ostrich feathers.*—The market for ostrich feathers has shown decided improvement during the last few weeks, especially for the better grades. One week's sales early in December, of 6,183 pounds, brought \$55,500; one in February, of 6,128 pounds, brought \$76,400. In the first week of April, 9,483 pounds were sold for \$100,000. The market is firm and competition keen, with every prospect of a successful season.

*Wool.*—Catalogue wool sales for the first week in April comprised 3,653 bales, which were as usual offered at public auction. Only 1,002 bales were sold at moderate prices. Really good lots only were in fair demand with prices unchanged from the previous week's sales. A large proportion of the offerings consisted of very wasty long wools and short faulty wools for which there was little demand, with the result that most of them were withdrawn.

**EXHIBITIONS AND FAIRS.**

[From Consul General Henry H. Morgan, Barcelona, Spain.]

**An International Food and Hygiene Exposition.**

The following letter from the director of the proposed Exposition of Food, Hygiene, and Various Products, to be held at Tibidabo, Barcelona, invites participation by American manufacturers:

We have the honor to inform you that under the patronage and with the collaboration of the Society El Tibidabo an Exposition of Food, Hygiene, and Various Products will take place at Barcelona from May 25 to June 25, 1912. This exposition, at which the merchants and business men of all countries may take part, will be installed in the rooms of the Tibidabo, specially arranged for the purpose. We have sent invitations to a certain number of business men of the United States and those of them who are willing to accept the invitation to exhibit their products there will be particularly well received.

[From Consul Augustus E. Ingram, Bradford, England.]

**Otley Agricultural Show—English Plans for Restrictive Exhibits.**

The Wharfedale Agricultural Society held its one hundred and fourteenth annual show at Otley (10 miles from Bradford) on May 3 and 4 last. The Otley show is always the first show of the north country season, and for that reason is largely attended, as there may be seen the stock likely to attain distinction elsewhere in the country during the year.

The total number of entries this year was 3,507, as compared with 2,942 last year. The cattle, which included some notable shorthorns, numbered 162. The horses, draft and agricultural, hackneys, hunters, and ponies, numbered 330, and among the hackneys some particularly fine specimens were shown, as in the district there are stud farms of national reputation. With the exception of pigs, which were not exhibited, owing to the stringent swine-fever regulations, all other classes of animals were well represented, especially dogs, the breeding of which receives so much attention in the north of England.

The Yorkshire show season this year will be more important than usual, owing to the Royal Show being held at Doncaster in July, when the King will be present.

In this connection it is of interest to note that a movement is being made in Yorkshire to request the Royal Agricultural Society of England to decline to admit to its shows cattle which have not been subjected to the tuberculin test and found to be free from tuberculosis. The object is to prevent the possible infection of sound animals by unhealthy stock.

---

This year's show of the Royal Agricultural Society of England will be held at Doncaster, England, July 2 to 6. The stock prizes committee has received notice from the Canadian Industrial Exhibition Association that it desires to offer at the show a silver medal for the best Dorset horn sheep. The implements committee reports the number of stands engaged as 443.

[From Consul J. C. McCunn, Glasgow.]

**Smoke Abatement Exhibition in Scotland.**

A Smoke Abatement Exhibition will be held in Glasgow under the auspices of the Glasgow Corporation from September 20 to October 20, 1912.

This exhibition promises to be more interesting and important than the very successful similar one in 1910. As the corporation will make

a special appeal to manufacturers to install in their works appliances for the abolition of smoke, particular interest will center in the numerous exhibits of smokeless fuel and patent appliances, electrical and gas, for all domestic purposes, heating, cooking, laundry, window lighting, advertising and all kinds of specialties, fireless cookers, and, in fact, everything connected with light and power. This is an excellent opportunity for American manufacturers in any of these lines to exhibit and advertise in a market that promises to be very fruitful.

Manufacturers of the United States are advised that an enterprising firm here, now exploiting American lines, offers to exhibit for Americans at the coming show without charge beyond the actual expense incurred and will become cash purchasers for any lines that prove acceptable to the consumers here if a guaranty of exclusive control of territory is given. No time should be lost in getting in touch with this firm, the address of which is obtainable from the Bureau of Manufactures. It would be well that manufacturers who desire to exhibit should, in order to save time and correspondence, state in their first communication the list and net prices of their apparatus or machinery and gross weights. The price should include free delivery, Glasgow.

[Correspondence from Alexandria in the Near East.]

#### International Games in Egypt.

A huge stadium of iron and stone work has been constructed at Alexandria on a plat of land set aside for that purpose by the municipality. The Philaton Sporting Society has spent \$40,000 in building the stadium of 10,000 seats. The beginning of June will witness a series of sporting events, both athletic and gymnastic, in which Egyptian and Greek clubs will take part. The Greek cruiser *Aivroff* and a flotilla of torpedo boats are expected from Athens in connection with the fêtes, and a number of visitors are to arrive from various towns and cities.

The Alexandria municipality has asked the International Olympic Committee to designate Alexandria for the Sixth Olympic Meeting, to be in 1916. Four have already been held—in Athens in 1896, in Paris in 1900, in St. Louis in 1904, and in London in 1908; the fifth is being held this summer in Stockholm.

---

#### AUSTRALIAN WOOL TRADE.

A Reuter dispatch from Melbourne states that the Victorian wool production for the past season amounted to 110,000,000 pounds, as compared with 101,803,000 pounds last season. The average weight of a sheep's fleece was 7.28 pounds, as compared with 6.99 pounds in the preceding year.

Dalgety & Co. have received the following advices from Melbourne: Exports of wool from July 1, 1911, to April 30 were: From Australia, 1,878,000 bales, an increase of 42,000 bales as compared with corresponding period of last season; from New Zealand, 430,000 bales, a decrease of 20,000 bales.

---

*New Jamaican sugar central.*—Consular Agent Harry M. Doubleday, of Montego Bay, reports the completion of a new sugar central 10 miles from that Jamaican port, and of a tramway from the factory to the wharf from which the sugar and rum will be brought to Montego Bay. The new central, which is owned by Scotch and Jamaican interests, has a capacity of 25 tons per day. The address of its manager may be obtained from the Bureau of Manufactures.

**OCEAN SHIPPING LINES.**

[From Consul General James A. Smith, Genoa, Italy.]

**Steamship Line between Tripoli and the Adriatic.**

The Commercial and Industrial Syndicate for Tripoli has instituted a direct line of steamships to ply between Venice and Tripoli. Ports of call will be Ancona, Barletta, Bari, Brindisi (other ports of Apulia, Italy, optional), Malta, and Tripoli. In order to encourage commerce and trade between the Adriatic ports of Italy and the port of Tripoli, samples not exceeding 50 kilos (110 pounds) in weight are to be carried free of charge. [The new Italian line between Sicily and Tripoli was noted in Daily Consular and Trade Reports for Apr. 6.]

**London to East Africa.**

The Union-Castle Line announces that, commencing with the departure of the *Guelph*, leaving London on May 16 and Southampton on May 17, the company's steamers inaugurate calls, outwards and homewards, at Porto Amelia (Portuguese East Africa) by the steamers engaged in their Royal East African service. Porto Amelia has a good harbor, and the establishment of these calls should assist developments affecting the Nyasaland Protectorate.

**New Philippine Island Line.**

The South Philippines Steamship Co., paid-up capital \$76,000, has been formed at Zamboango, Mindanao, and chartered by the Government to engage in coastwise trade. Several prominent capitalists of Moro Province are interested.

[Statement by the New York agents of Norway-Mexico Gulf Line.]

**Norway-Mexican Gulf Line.**

The Norway-Mexico Gulf Line has just issued its statement for 1911, showing gross earnings of \$470,000. After paying a dividend of 5 per cent upon the capital invested, interest on builders' loans, and all charges and expenses, a net surplus of \$36,000 is carried forward to the depreciation fund, which now amounts to about \$44,500.

This line is subsidized by the Norwegian Government and operates the only direct line of freight and passenger steamers between Norwegian and Swedish ports and the United States, calling at Newport News, Va., and the Gulf ports. It owns three new steamers of about 6,000 tons capacity, with which it maintains a monthly service. The line is contemplating building a shelter-deck steamer of 6,000 tons for the Gulf service, and to eventually increase its fleet to six steamers, to ply in two divisions, one to the Gulf and the other to the North Atlantic ports.

**The Prospective 18-inch Gun.**

An English engineer in a paper dealing with "The manufacture and treatment of steel for guns," read before the Iron and Steel Institute, referred to the increase of size in modern ordnance and said that there were now rumors concerning a gun of 18-inch bore and weighing between 150 and 200 tons in succession to the 14-inch gun.

*French wine production.*—Consul Louis Goldschmidt, of Nantes, reports that the total value of the eight French wine crops from 1904 to 1911, inclusive, is officially estimated at 29,700,625 francs (\$5,732,221), giving an average value per crop of \$716,538, or \$467 per hectare (2.47 acres).

**LACROSSE PLAYED IN ENGLAND.**

[From Consul Church Howe, Manchester.]

The game of lacrosse is played more in Manchester and surrounding suburbs than in any other part of England. The game is practically confined to the north and south of England, with centers at Manchester and London, the season extending from September until the end of April.

The North of England Lacrosse Association, with headquarters in this city, is composed of some 50 affiliated clubs, with an estimated membership roll of 2,000, more than half of whom are active playing members. Many local schools and colleges have taken up the game, and each year sees an increase in the proportionate playing strength of the clubs. The Yorkshire district is also being opened up to the game. Exhibition games are frequently held in the Lancashire towns, with a result that new clubs are frequently formed.

The lacrosses sold in the sports outfitters stores here are practically all of Canadian make, no American-made goods being noticed during an inspection of one of the leading stores. A concern of Cornwall, Canada, furnishes the major portion of the lacrosses used in the north of England. It seems to be the general practice of the Canadian makers to ship the lacrosses over here complete.

The sports depots carry stocks of sticks, principally for making lacrosses to players' own requirements and for repair work. I am informed that in most cases it is more profitable to purchase ready-made consignments than import the lacrosse sticks and have them strung here.

Present prices for lacrosses range as follows: Men's, \$3.65, \$3.28, \$3.04, and \$2.55; ladies', \$2.80; youths' size, \$2.55, \$2.07, \$1.58, and \$1.34; boys', 85 and 42 cents. Best Canadian men's sticks retail at \$1.09; ladies', 73 cents; and youths' about 40 cents.

American manufacturers of hardwood articles, such as lacrosse sticks, have neglected the English market. The opportunities for the introduction of these goods into this district are encouraging. [The addresses of Manchester sports outfitters which handle lacrosses and lacrosse sticks may be had from the Bureau of Manufactures.]

---

**PAN AMERICAN RAILWAY CONNECTION.**

[From Hugh R. Wilson, secretary American Legation, Guatemala City.]

With reference to connecting up the links in the Pan American Railway, the Guatemala Central Railway makes the following announcement, by which it appears that connection will be made with the Mexican Railways in June, 1913:

In the railway line which begins at Las Cruces and is to end at Ayutla, passing by Coatepeque on the Pan American route, there are 12 miles completely graded to a point called Santa Joaquina. The rails reach the river or ravine called Talpechos, where a viaduct 580 feet long is being placed. By the end of May the track will reach "mile fifteenth," only 5 miles from Coatepeque. The difficulties to be encountered in this part of the road will make it impossible to conclude this work before the end of this year.

The rest of the road to the Mexican frontier does not offer any difficulties. The part of the Pan American Railway pertaining to Guatemala on the western side is expected to be finished in June of next year; it will join at Ayutla with the Pan American Railway of Mexico. The section through which they are building has a good climate, not presenting the difficulties in regard to health for the laborers as the first miles did. The station of San Miguelito on the new line has already given good service during the last crop.

**SIBERIAN FUR TRADE.**

[From Consul General John H. Snodgrass, Moscow, Russia.]

The requirements of fashion were the cause of the greatest destruction in 1911 of wild animal life in the history of Siberia. The total returns of the fur trade in that country amounted to more than \$4,000,000, or over \$500,000 in advance of 1910.

There were 4,525,000 gray squirrels killed in the Siberian woods. The sales of the tails alone, used for boas and dress trimmings, amounted to 21 tons. The Siberian dealers made \$2,000,000 on this fur, which, because of the increased demand on the foreign markets, has gone up 15 to 20 per cent in price. The cheapest skin sold for 15 cents; the superior qualities 32 cents. The price for tails rose to \$5.50 per pound.

Next after the gray squirrel comes the white hare; 1,500,000 of these brought \$275,000. Of sables, 12,250 were killed. The most valuable dark sables were sold at an average price of \$200, but there were not many buyers for this fashionable luxury, and a much better sale was reached with the cheaper qualities. The total amount received for sables was about \$500,000.

**No White Bear Skins—Other Furs.**

Arctic fox was scarce. About 100 skins were offered, which were valued at \$100 and \$250 each. Ermine has again become fashionable, and 200,000 animals were sold for \$350,000.

The slaughter of brown bears continued; 1,500 of them realized only \$11,000, or less than \$7.50 per skin. The price of this fur has been going down for some time, which fact is due to the improved conditions in railway travel across Siberia, where the cars are kept warm and comfortable. Not a single white bear skin was brought to Irbit. They are said to be very scarce.

More than 180,000 "kolonki" (a species of the skunk) were killed and sold for only \$150,000, the skins averaging about 75 cents each. The tails of the "kolonki" are used by artists for paintbrushes. Of gray wolves, 16,500 were killed and realized a good price—\$6.50 each. This is said to be quite unusual.

It appears that all the valuable furs have their imitations abroad, even sable, splendid imitations of which are said to be made from squirrel.

[Various phases of the Russian fur industry have been presented in articles published in Daily Consular and Trade Reports for Sept. 17 and Nov. 1, 14, and 28, 1910; Aug. 12, 1911, and Feb. 6, 1912.]

---

**Risks in Purchasing Chinese Cocoons.**

Insurance companies at Shanghai have hesitated in insuring the money which silk merchants must carry into the Chinese interior for purchasing cocoons. For the Wusieh and Shao-hing cocoon markets alone \$10,000,000 in silver (representing nearly \$5,000,000 American gold) is required.

---

The Bureau of Forestry, Department of Agriculture, has issued a "Record of wholesale prices of lumber per 1,000 feet b. m., based on actual sales made f. o. b. mill for each quarter calendar year 1911." Copies can be obtained free on application to that bureau.

### PROPOSED NATIONAL SCHOOL OF INDUSTRIAL ART.

At the annual meeting of the American Federation of Arts, in Washington, on May 9, resolutions were adopted relative to the establishment of a National School of Industrial Art at the Capital, and it was decided to urge action by Congress on the matter.

The plan for this school includes Federal support, through a national headquarters, to local schools in different sections of the country that are duly incorporated for the furtherance of industrial art education relating to the arts and crafts, the home industries, and the technical art products of a community.

The federation further states that different geographical sections require different schools that shall relate to the respective home and manufacturing interests. Manufactures into which art enters as a factor of production and value of product should have that Government support which is accorded to such interests in other countries, to the end that technical art products of the United States shall have an increased æsthetic value, implying also increased commercial value.

A committee has been authorized by the federation to develop this plan. It is evident that important results might be obtained through a national industrial school inspiring local schools to the uplifting of standards of quality. Such a movement has special significance in relation to the competition in foreign markets of American products in which art quality is a factor.

---

### THE LONDON POLYTECHNICS.

[From the London Times.]

There are a number of institutions in London known as polytechnics where technical instruction is given to day and evening students. These institutions fill the same position as do the municipal technical schools of Birmingham, Plymouth, Portsmouth, etc., with the additional advantage that the polytechnics have teachers "recognized" by the University of London, and their students are therefore eligible for the internal degree. These institutions in London comprise the Southwestern, Northern, Regent Street, Battersea, Borough, and Woolwich Polytechnics, the Goldsmiths' Institute, the Northampton Polytechnic Institute, the Sir John Cass Institute, the Birbeck College, and the City of London College. There are similar institutions in the suburbs of Greater London.

The London institutions have cost more than \$5,000,000. The total ordinary receipts in 1909 amounted to \$1,004,762; the council's grant was \$377,135; the grant from the board of education, \$190,286; from the city parochial foundation, \$140,739; from the city companies, \$29,554. The total ordinary expenditure of all the institutions was \$1,045,310 and the expenditures of an exceptional nature were \$164,352.

There were 20,000 students enrolled in the polytechnics in 1910-11, and it appears that the ordinary cost of running the institutions was about \$50 per student. If account were taken only of the students who attended 75 per cent of the lectures and classes, it is probable that the cost would be \$250 per student per year.

---

### Commercial Laws of the World.

There is being added to the library of the Bureau of Manufactures the new 26-volume work on the Commercial Laws of the World. It is printed in both English and Spanish, and may be consulted by the public. The first two volumes have been received.

---

*Railway cars* were imported by Belgium in January and February to the value of \$3,600,000 against \$2,400,000 in the first two months of 1911.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

- No. 652. Construction of post office buildings.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., for the construction, complete (including plumbing, gas piping, heating apparatus, electric conduits and wiring, and interior lighting fixtures), of the following post offices: (1) Until June 18, at Kingfisher, Okla. Building is one story, basement, mezzanine and unfinished attic, and has a ground area of approximately 3,800 square feet; nonfireproof construction, stone and stucco facing, and tile roof. (2) Until June 24, at Union, S. C. Building will be one story and basement, of 4,117 square feet ground area, brick faced, with stone trimming and tin roof. (3) Until June 25, at Mansfield, Ohio. Building will be two stories and basement and have a ground area of about 7,800 square feet; first floor only of fireproof construction; tin roof; and stone facing. (4) Until June 26, at Newark, N. Y. Building is one story and basement and has a ground area of approximately 3,900 square feet, nonfireproof construction, stone, brick, and stucco facing, and tin roof. (5) Until June 27, at Chester, Pa. The work contemplated is the construction of a two-story, basement, and unfinished attic extension of approximately 2,300 square feet ground area. First floor only is fireproof construction, exterior facing of stone and brick, with slate roof, and there will be certain repairs and alterations in the present building. (6) Until July 1, at Newark, Ohio. The building is two stories and basement and has a ground area of approximately 6,900 square feet; fireproof construction throughout; granite and marble facing; and tin roof. Drawings and specifications of these various buildings can be obtained from the custodians of sites at the various points, or at the office of the Supervising Architect.
- No. 653. Supplies for Post Office Department.**—Sealed proposals will be received at the office of the Purchasing Agent for the Post Office Department, Washington, D. C., until June 12, 1912, for furnishing paper tape and ribbons for time recorders, motors for canceling machines, strawboard, guide cards, plain and printed "facing slips" for use as labels on packages of letters, time cards for street letter boxes, rubber and metal stamps, dies and type, malleable-iron castings and rings, bronze metal and brass safety key chains, flat steel key rings, German-silver badges for railway postal clerks, steel cutters for issuing money orders, side of leather, cotton canvas and remnants for repairing mail sacks, jute waste sacks, dials of pyralin or other suitable material, paint for street letter boxes, duck satchels for city collection service and leather satchels for special-delivery messengers, as may be required by the postal service during the fiscal year beginning July 1, 1912. Form blanks and proposals, with specifications and instructions to bidders, will be furnished upon application to the purchasing agent.
- No. 654. Ocean mail service.**—Proposals will be received at the Post-Office Department, Washington, D. C., until October 15, 1912, for ocean mail service, pursuant to the act of March 3, 1891, on the routes described, service to commence not later than January 1, 1913. Circulars containing a description of the routes, instructions to bidders, and blank forms of proposals, with accompanying bonds, can be obtained of the Second Assistant Postmaster General.
- No. 655. Switch panels.**—Proposals, in duplicate, will be received at the office of the Chief Signal Officer, War Department, Washington, D. C., until May 29, 1912, for 50 switch panels, time interval, in accordance with specifications 568 and 397-B and drawings 869 and 827-B. (Proposal No. 586.)
- No. 656. Air-lift pumping plant.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until June 11, 1912, for an air-lift pumping plant at the United States post office and courthouse at London, Ky. Copy of specification and drawing can be obtained of custodian at London, Ky., or of the Supervising Architect.
- No. 657. Tool chests.**—Proposals, in duplicate, will be received at the office of the Chief Signal Officer, War Department, Washington, D. C., until May 31, 1912, for 25 chests, tool, electrical engineers', complete, in accordance with specification 192-C and drawing 101b-1. (Proposal No. 587.)

## PUBLICITY AND THE AGENCY PROBLEM IN GERMANY.

[By Commercial Agent Archibald J. Wolfe.]

Publishers of American trade journals paying attention to the export trade and of export journals in general are apt to overlook one important medium for reaching an immense circle of readers in Germany. As a rule these publishers send their copies to individual addresses, either subscribers or persons specially selected as likely to be interested in American goods. The ratio of interest and importance to the individual advertiser in a paper carrying miscellaneous advertising is thus necessarily small. It would be to the great advantage of such publications and their advertisers if they carefully studied through special emissaries the means of reaching the business community of each country and adopted special circulation plans for each.

Now it happens that there exists in Germany an excellent machinery for reaching a vast number of readers which, for instance, is entirely lacking in England. The German is far less in the habit of subscribing to or regularly purchasing magazines and trade journals than the American or the Englishman. Every German city of consequence has a number of palatial cafés, which are nothing else than huge clubhouses without membership formality. In any one of these cafés will be found at any time of day and night hundreds and even thousands of patrons glancing over domestic and foreign newspapers and magazines. These cafés maintain libraries of directories of the entire world, and keep on file newspapers from St. Petersburg to New Zealand, from Yokohama to the Cape of Good Hope. Every German export paper is to be found in such a café. Likewise every hotel of consequence maintains a magazine and newspaper library.

### Advantage of Having Trade Papers in Cafés.

A few hundred copies of American trade magazines and export periodicals judiciously placed in cafés of Germany would reach a circle of readers at least several hundred per cent larger than indicated by the number of copies filed. These papers would be read by representative business men and likely agents. Of course, it would be well to have such publications in German, but English will be also understood in the absence of German publications.

The German edition of an American export paper was found by one of my informants of the Berlin trade press in a hotel in Dusseldorf. He showed the periodical to a friend, who saw on the front page the picture of a motor boat.

"Here is exactly what I have been looking for; where is their agent in Berlin?" asked the latter. The advertisement was in German, but there was no indication of a place in Germany where such a boat could be had. Now, when a man wants to buy a motor boat he does not waste months in correspondence with foreign countries, but wants to see the boat and buy it quickly. This applies to most articles which it is hoped to sell abroad through advertising in export journals. Business with Germany can not be done at long range. It is necessary to have resident agents here. An advertisement of an American article which does not mention an agent in Germany loses much of its force with a German.

One of the results of placing these publications in the cafés of Germany would be the receipt by the advertisers of a large number of applications for agencies. If properly sifted, valuable connections may be made.

#### **The Agency Problem.**

American manufacturers have hitherto followed generally one of two plans in selecting their agents in Germany. Either they receive an application from some unsolicited source for their agency, or they procure from some one a list of agents handling similar goods and proceed to offer them their agency.

In the first instance, the applicant is frequently an undesirable agent. He has seen somewhere the advertisement of the American manufacturer and thinks it would be a good thing to get his agency. Now, if the advertisement of the American manufacturer reached very wide circles of interested readers the applications would be more numerous and there would be a greater chance of hearing from a desirable applicant.

In the second instance, the manufacturer is even worse off. He comes to an agent as a petitioner and the agent has the upper hand. If he is a machinery manufacturer he is apt to be referred to one or the other of the world-famous machinery houses in Berlin or Cologne, which are overcrowded with American agencies. In fact, they are not agents at all; they are jobbers. They have absolutely no interest in pushing any particular make of machine or tool in preference to another. It is inconceivable how American manufacturers of machinery can be content to turn over the handling of their products to a concern without troubling themselves to know where their goods finally go. They would not dream of doing business in this manner in Illinois, Alabama, or Massachusetts.

A manufacturer of a certain machine tool came to Berlin and was heartbroken when a great machinery jobber refused to add his line to several hundred others handled by him. It was the best thing that could have happened to him.

#### **Agent Must be Genuine Representative.**

If the manufacturer of a machine desires to find a market in Germany, he must find an agent capable of representing him properly. It is not enough to sell a few machines to a great jobber. The representative should not be a man handling three or four or, as in the

case of the houses referred to, several dozen competing makes. He must understand the science of making the manufacturer's name and make known, and appreciated. The tremendous value of an established reputation in Germany is an asset of the highest importance. The manufacturer must know where his goods go. His representative must watch for openings. The experience of a well-known British manufacturer of water purification plants illustrates the point. This concern sold a water purification plant to a house in Germany. It occurred to the manufacturer a year or two later that the order should have been repeated and he wrote his customer three or four letters on the subject. A casual German visitor told the British manufacturer in due course that he had seen a similar plant built under a German patent by a concern in Germany which was doing a tremendous business. Investigation showed that the erstwhile customer simply discovered that the Britisher had not patented his plant, and the German did it himself, a piece of sharp practice, perhaps, but no excuse for ignorance and negligence on the part of the manufacturer.

If a German manufacturer had sold a water purification plant, say, in Belgium or Turkey, he would not have waited years and then contented himself by writing a few letters. He would have concluded that there was a chance of doing business in that district, sent a salesman to investigate, and by his watchfulness would have prevented a state of affairs whereby he had sold one plant and enabled an imitator to do a tremendous business.

There is a market in Germany for many American articles, but the American manufacturer who seeks to cultivate it must do so on a rational basis, and then there will be no place for the frequent complaint: "Yes, I had at one time a good business in Germany, but it has dwindled to nothing."

The proper selection of agents in Germany is an essential condition to permanent success. Next is the proper observance of good faith with one's own agents.

[Mr. Wolfe furnished with the foregoing report the names and addresses of the principal cafes in Berlin maintaining files of foreign magazines; the list may be obtained by application to the Bureau of Manufactures.]

### LAWN TENNIS POPULAR IN JAPAN.

[From Consul General Thomas Sammons, Yokohama.]

Lawn tennis has become very popular among Japanese high-school and college students. Intercollegiate games have also become popular among the students and their friends. Among the well-known institutions that have a large number of enthusiastic tennis players are the following: Tokyo Higher Normal School; Tokyo Commercial School (higher); Waseda University, Tokyo; Kyoto University, Kyoto; Third High School, Kyoto.

The foreign communities in the various ports, Yokohama, Kobe, and Nagasaki, have tennis clubs, which for convenience may be addressed "Foreign Tennis Club," at the various ports named. The leading foreign tennis club here is known as the Ladies' Lawn Tennis Club. Tennis rackets are already being manufactured in Japan, there being six factories in Tokyo alone [a list of which may be had from the Bureau of Manufactures, Washington, D. C.].

## CONSTRUCTION WORK ABROAD.

## THE NETHERLANDS.

[From Consul General S. Listoe, Rotterdam.]

**Construction of Three New Harbors at Rotterdam.**

Fully in accordance with the principle thus far adhered to by the Rotterdam magistrates, viz, "not to wait until there is a shortage of harbor facilities, but to be ahead of the needs of navigation by a choice offering of docks," a plan has again been submitted to the city council of Rotterdam for three new harbors, with quays and docks, in the extreme western section of this city, on the right side of the River Maas.

**Details of the New Harbors.**

The dimensions of two of the proposed harbors are to be as follows: Yselhaven, length 880 yards, width 130 yards, depth 33 feet; Lekhaven, length 600 yards, width 130 yards, depth 33 feet. Both of these harbors are intended for seagoing steamers of large size, and the surrounding quays will be constructed of large concrete blocks, which latter have in many instances proved to be more reliable than the old-style quay walls built on a pile foundation, besides being cheaper.

The total length of quays which will be available to shipping at this port is thus again increased with 3,100 yards, surrounding which an area of 26 acres will be at the disposal of those interested in navigation for building docks, sheds, cranes, and all other and necessary implements for handling merchandise and loading and discharging steamers.

The third harbor is planned on an entirely different scale, viz: Keilehaven, length 1,000 yards, width 80 yards, depth 13 feet. This harbor is intended for lighters and all such crafts as are used by the manufacturing interests, and the 22 surrounding acres are expected to be utilized for establishing various manufacturing plants, to be erected in the near future. This harbor will not be constructed with quay walls, but with a slope of brick, which is considered satisfactory for the use to which the harbor is in all probability destined.

The total amount involved in constructing these three harbors is estimated at \$3,100,000. The width of 130 yards for the two principal harbors has been determined upon with a view to the ever-increasing use of floating mechanical installations for discharging grain, ore, and other staple articles, and for bunkering coal.

**Depth of Various World Canals and Harbors.**

The question of the depth to which the new harbors shall be dug has been the subject of a thorough study by engineers of the department of public works of the city of Rotterdam, and their report gives the following information as to the increasing draft of steamers in the world's traffic, and the depth of other harbors and canals:

The Suez Canal will at the close of 1913 have a depth of 36 feet, and steamers with a draft of 31½ feet will be allowed to pass through.

The Panama Canal, to be opened in the beginning of 1915, with a depth of 45 feet, will accommodate vessels drawing 40 feet.

The Kaiser Wilhelm Canal, though of less importance to the international traffic, is now being dredged to a depth of 35½ feet, and the new sluices under construction are being built for a future depth of 45 feet.

The dimensions of the larger vessels will for the future be governed by the draft permitted through the Panama Canal. The Suez Canal can readily be rendered

suitable for larger vessels, and its depth increased at comparatively small expenditure in consequence of the sandy bottom and the absence of sluices.

The existing conditions at Rotterdam and harbor competitors on the Continent are defined in the following table:

Ports.	Depth of waterway.		Depth of harbors.	
	High water.	Low water.	Existing.	In construction.
	<i>Feet.</i>	<i>Feet.</i>	<i>Feet.</i>	<i>Feet.</i>
Rotterdam.....	33	28	33	30
Hamburg.....	34	28	30	25
Antwerp.....	41	26	30	27
Amsterdam.....	37	32	32	33
Bremerhaven.....	35	24	33	30
Emden.....	33	33	28	25

The relative figures for the British ports have been ascertained as follows:

Ports.	Depth of fairway.		Depth of harbors.	
	High water.	Low water.	Existing.	Proposed.
	<i>Feet.</i>	<i>Feet.</i>	<i>Feet.</i>	<i>Feet.</i>
London:				
London Docks.....	37	16	25	25
West India Docks.....	41	20	29	31
Royal Victoria Dock.....	51	30	26	28
Royal Albert Dock.....	41	30	27	30
Southern Dock (proposed).....	41	30	.....	44
Northern Dock (proposed).....	51	30	.....	44
Tilbury Docks (old).....	51	30	38	38
Tilbury Docks (new).....	51	30	.....	48
Southampton.....	45	32	35	40
Liverpool.....	54	37	35	.....

The third group of harbors, which were of considerable influence in the planning of the new harbors, are those of North America, as follows:

Ports.	Maximum depth of harbors.		Harbors building.	
	Low water.	High water.	Low water.	High water.
	<i>Feet.</i>	<i>Feet.</i>	<i>Feet.</i>	<i>Feet.</i>
New York.....	35	40	40	46
Philadelphia.....	30	.....	30	.....
Boston.....	35	45	.....	.....
Baltimore.....	35	36	.....	.....
Quebec.....	33	48	.....	.....
Montreal.....	26	.....	30	.....

From the above figures the conclusion has been drawn that a minimum depth of 33 feet at low water, corresponding to 38 feet at high tide, is required for Rotterdam's new harbors if the port cares to remain in line with other prominent ports.

#### Railway Connection—Waterway to Sea—Annexing Schiedam.

Arrangements will be made with the Holland Railway Co. to connect the new harbors with the railway system of the Netherlands.

The natural consequence of the building of larger vessels will in time necessitate deepening the New Waterway to the North Sea, but in an official pamphlet published by the Government engineer, who is in charge of the superintendence of that fairway, the state-

ment is made that the depth of the New Waterway can be increased 3 to 6 feet at a comparatively small outlay.

The outside limits of the city of Rotterdam on the right side of the Maas River have by these plans been appropriated as far as possible, and these new harbors will border upon the dividing line between Rotterdam and Schiedam. However, before being able to proceed any further in constructing new docks, etc., it will be absolutely necessary for Rotterdam to annex the city of Schiedam.

---

### FRANCE.

[From Consul General A. Gaulin, Marseille.]

#### Town Planning in Marseille.

Expropriation proceedings on an extensive scale were started during last year by the municipal government of Marseille, for renovating one of the oldest sections of the city (the so-called "Quartier de la Bourse" or Commercial Exchange quarter), in accordance with plans adopted a number of years ago. The present network of narrow, winding streets in that quarter will be transformed into broad thoroughfares, and a large number of antiquated structures will be torn down and replaced by modern buildings.

Some progress was made during the past year on the construction of the Marseille-Rhone Canal, the Madrague Basin, and a seventh dry dock. The freight-handling facilities of the port were considerably increased, the new appliances comprising 5 electric cranes, installed by the chamber of commerce, and 20 hydraulic cranes belonging to the Compagnie des Docks et Entrepôts (Bonded Warehouse Co.). Further additions will be made in the near future.

---

### SCOTLAND.

[From Consul Rufus Fleming, Edinburgh.]

*Water-supply schemes.*—Dunbar will construct auxiliary waterworks, to cost about \$80,000. Letters to contractors in regard to materials, etc., may be addressed in care of the Town Clerk, Dunbar, Scotland. Waterworks are to be constructed in East Plean, which will require about 2½ miles of cast-iron pipes, varying from 2 to 5 inches in diameter, and relative supplies and materials. Letters may be addressed East Plean Waterworks, care of Thomas Lupton, Esq., District Clerk, 22 King Street, Stirling, Scotland.

*Fire-clay pipe sewers.*—The eastern district committee of the Stirling county council will soon award the contract for laying 1½ miles of fire-clay pipe sewers (from 6 to 15 inches in diameter), with man-holes and other appurtenant works, and constructing liquefying tanks, detritus chamber, etc. Proposals as to materials may be addressed Laurieston Drainage, care of J. H. Burns, District Clerk, Falkirk, Scotland.

*Public hall furniture.*—A large public hall, for which the sum of £100,000 (\$486,650) was given to the city of Edinburgh many years ago by a citizen, is nearing completion. It will be devoted principally to musical purposes and will seat 3,500. Its furnishing will soon engage the attention of a committee of council. Letters relative to styles of seats and other furnishings for such places of entertainment may be addressed to the Town Clerk, Edinburgh.

**ENGLAND.**

[Taken from the local press by Consul Benjamin F. Chase, Leeds.]

**Prospective Enterprises in Yorkshire.**

The town council of Batley, Yorkshire, has decided to expend \$38,932 in purchasing a new 740-kilowatt reciprocating engine set and a like amount for new cables for its electric plant.

The town of Dewsbury, Yorkshire, is enlarging its electric plant and will expend about \$70,564 on new machinery and cables. A steam turbine set (1,000 kilowatts) has been selected and the project approved by the council.

A project is under way by residents of Barnoldswick, Yorkshire, to construct a railway to connect that town with Gisburn, about 4 miles. Estimated cost is from \$204,400 to \$219,000. Fred H. Slater presided at a recent meeting for this purpose at Barnoldswick, and E. O. Ferguson, an engineer, seems also to be interested.

**AUSTRIA-HUNGARY.**

[From the Zentral Anzeiger für das Öffentliche Lieferungswesen, Vienna.]

**Tramway, Wharf, and Hospital.**

Arrangements have been concluded for constructing a tramway from Bozen to Leifers at a cost of \$200,000, half subscribed by the city authorities and half by independent sources.

As a result of representations made by the Fiume shipping authorities, the Austrian Ministry of Commerce has arranged to build at that port a new ferroconcrete wharf, about 55 yards wide and 90 yards long, to cost \$500,000.

The Fiume municipal authorities have decided to erect in that city an infirmary at a cost of \$1,076,000 and a fever hospital at a cost of \$210,000. Work on both buildings will be commenced this year.

The communal authorities of Zwittau have decided to arrange for a \$100,000 loan for waterworks.

**GREECE.**

[From report of British consul at Patras.]

**Railway Line to Turkey Proposed.**

It is proposed to extend the present railway line of northwestern Greece, which starts from Krioneri on the northern side of the Gulf of Corinth, opposite Patras, passing through Missolonghi towards Agrinion as a terminus, to the town of Arta on the Turkish frontier; but it has not yet been decided from which point of the line the proposed extension will start.

**INDIA.**

[From Consul Edwin S. Cunningham, Bombay.]

**New Scientific Library Building.**

Sir Vasanji Trikamji Mulji, of Bombay, has given \$73,000 for founding a scientific library in connection with the Royal Institute of Science. The Bombay Government officers who will administer the fund are the Educational Secretary and the Director of Public Instruction, with the aid of Mr. G. Wittet, consulting architect to the Government. Plans have been made for a \$33,000 building, the erection of which will be a continuation of the plans for buildings for this institution. Structures commenced last year and still building are the Sir Cowasjee Jehangir buildings and public hall, Sir Currimbhoy Ebrahim buildings, and the Sir Jacob Sassoon buildings. The Royal Institute of Science was founded by the Bombay Government for the promotion of science in its higher branches.

[European press dispatches, supplementing Consul Lupton's report in Daily Consular and Trade Reports for May 11.]

**The Trans-Persian Railway.**

A dispatch from Simla, India, says that Mr. Johns, the engineer surveying the Mekran section of the proposed Indo-Persian railway, has found a good route from Karachi to Gwadar with a general gradient of 1 in 250, the steepest being 1 in 90.

Reuter's Agency learns that during the past few weeks important progress has been made in connection with the preliminary stages of the proposed Trans-Persian railway. As a result of a series of conferences which have taken place in Paris between the international groups, the Statutes of the Société d'Etudes, which is to deal with the question of the necessary surveys for the line, the possibilities and costs of the undertaking, the concession from the Persian Government, and other matters, have been formulated.

The Société d'Etudes will comprise three groups—British, French, and Russian—each of which will provide \$150,000 toward preliminary expenses. The council of administration will have 24 members—8 British and a similar number of French and Russians. There will also be a committee of direction composed of 12 members selected from the council of administration.

It is understood that Sir William Garstin will be vice president, and that the British group will include representatives of Messrs. Baring, Parr's Bank, the Imperial Bank of Persia, Messrs. E. D. Sassoon, and Messrs. Forbes, Forbes, Campbell & Co., the Indian merchants.

---

### CANADA.

[From Consul Felix S. S. Johnson, Kingston, Ontario.]

#### Kingston Harbor Improvements.

A delegation from this city, which waited on the Minister of Public Works at Ottawa, were assured that Kingston would be made a national port. The harbor improvements will cost about \$1,750,000, and will make Kingston the Buffalo of Canada. The city transfers to the Government the bridge spanning the inner harbor. It will be replaced by a causeway costing \$230,000 preliminary to dredging operations. It is likely that the span in the causeway will be operated on the jackknife principle. Tenders for the causeway will be called for not later than August 1. In the meantime plans and specifications will be prepared for a temporary bridge and tenders invited.

That the Canadian Government does not intend to lose any time in constructing the causeway is shown by the fact that an engineer of the Public Works Department left on May 16 for Chicago to confer with some construction companies in regard to steel to be used. After the causeway is built the harbor will be dredged both above and below, and the wharves and elevators constructed.

---

### CHILE.

#### Award of Valparaiso Harbor Contract.

Consul Winslow, of Valparaiso, corroborated the dispatches in Daily Consular and Trade Reports for May 13 concerning the tenders for the Valparaiso port works. A further dispatch from Santiago states that the Chilean Government accepted the bid of an English firm, the work to start next October and cost \$12,652,000. The successful tenderers are Pearson & Son.

---

### ARGENTINA.

[From the Boletín Oficial, Buenos Aires.]

#### New Department of Agriculture Building.

The executive authorities are authorized by law 8881 to give out to contract the construction of a building for the Ministry of Agriculture and for all the offices belonging to that department. The sum earmarked for this purpose amounts to 5,000,000 pesos currency (\$2,123,000).

---

*Manchester cotton yarn* was shipped to the United States during the first four months of this year to the extent of 1,943,800 pounds.

**NORGINE FOR SOFTENING TEXTILE GOODS.**

[From Consul General Henry Bordewich, Christiania, Norway.]

The agglutinant "norgine" is not manufactured in Norway. This information I have from a Norwegian official who has looked into the matter carefully. His belief is that norgine is manufactured by one factory only in all Europe (Die Fabrik Norgine, of Aussig am Elbe in Bohemia.) Norgine is said to be manufactured from kelp, which consists of the ashes of the seaweed *Laminaria*. Kelp is an article of export from Norway, the shipments in 1910 aggregating 2,318 English tons, all to Great Britain. The total export of iodine was 13 tons, all to Germany.

[From Consul J. I. Brittain, Prague, Bohemia.]

**The Manufacture of Norgine.**

Norgine is manufactured at the chemical works of Dr. Victor Stein at Aussig, Bohemia. The inventor of norgine is said to be a Frenchman from whom Dr. Stein purchased the patent rights for Austria. So far as could be ascertained, norgine is chiefly used here in the textile industry for stiffening and dressing purposes, and gives very satisfactory results. It is, however, not used as a substitute for potato starch, dextrine, etc.; being used only as an admixture in starch to give the goods a softer and more flexible feel.

Norgine is therefore considered as a ligament or agglutinant. The seaweed from which it is made is imported from Sweden, the ashes from seaweed being also imported for making certain grades of the product. There are manufactured eight grades of norgine which again are divided into several classes. A by-product of norgine is iodine.

---

**A SPANISH MUSICAL SUCCESS.**

[From Consul Robert Frazer, Jr., Valencia.]

The preeminent Spanish musical success of the past year was called *La Corte de Faraón* (The Court of Pharaoh), the music being by Vicente Lleó and the libretto by Guillermo Perrín and Miguel de Palacios. It was the enthusiastic encomium of the piece by an American theatrical manager who recently visited this city that prompted the little article in *Daily Consular and Trade Reports* for March 30, 1912. There is a legend on the cover of the music stating it to be "the property of the publisher in all countries," the publisher being Ildefonso Alier, Plaza de Oriente, No. 2, Madrid. The music, which is the best part of the work, is unusually striking, and I and other Americans who have heard it believe is of the sort which would be received in the United States. The book, while very clever in Spanish, is treated with a degree of license, both as to plot and dialogue, which would probably require its being written anew for the American stage. The printed music as sold arranged for the piano and voice fills 78 pages, and sells for 13 pesetas (about \$2.40). Others among the most popular musical pieces are: *La Reina Mora* (The Moorish Queen), 12 pesetas (\$2.16); *Los Bohemios* (The Bohemians), 12 pesetas; *Alma de Dios* (The Spirit of God), 9 pesetas (\$1.62).

The Association of Spanish Dramatists (*La Sociedad de Autores Espanoles*), referred to in the previous report, has its headquarters in Madrid.

## AMERICAN TRADE WITH THE PORT OF LONDON.

[By Consul General John L. Griffiths.]

That the port of London plays an important part in the American trade with the United Kingdom is found in the fact that of the total imports, valued at \$606,112,871, from the United States and possessions into the United Kingdom last year, articles amounting to \$94,080,685 entered the port of London from the United States. Of the total exports, valued at \$247,736,242, invoiced through the several American consulates for the United States and possessions in 1911, \$117,863,539 worth were declared through the consulate general at London.

## Imports from the United States.

Among the principal imports last year were wheat, wheat meal and flour, lard, cotton, leather, maize, motor cars, and oxen and bulls. The following table shows the quantity and value of the principal imports from the United States last year:

Articles.	Quantity.	Value.	Articles.	Quantity.	Value.

**Exports to United States and Possessions.**

There was an increase of \$3,589,102 in the value of the articles invoiced through the consulate general at London to the United States and possessions compared with 1910. The gain in the shipments to the United States was \$3,331,758, to the Philippines \$46,736, to Hawaii \$130,323, and to Porto Rico \$80,285. The articles contributing largely to the gain to the United States were automobiles and parts, books, coffee, opium, hats and caps, platinum, tin, precious stones, rubber, and seeds and plants. There was a large decrease in the shipments of bristles, cotton manufactures, coal-tar products, feathers, furniture, china and earthenware, grease, leather, linseed, copper, oils, ores, skins and furs, wool and hair, and antiques, etc. The following table shows the exports to the United States and possessions for 1910 and 1911:

The total value of returned American goods invoiced through the London consulate general during last year was \$2,298,754, against \$1,730,303 for 1910. The principal items for last year were: Pearl necklace, \$498,617; leather and manufactures, \$319,671; motor cars and parts, \$281,465; metals and manufactures, \$172,647; horses, \$191,643; machinery, \$117,728; and dental gas, \$74,457.

**Tonnage of Total Imports, Shipping, and Port Improvements.**

During the year ended March 31, 1911, 2,173,223 long tons of imported goods for warehousing or for direct delivery to land conveyances were handled by the port authority against 2,050,795 tons

in the previous year. The principal increase was in the chilled-beef imports, due to the new weekly line from the River Plate, the receipts of which amounted to 215,446 tons, compared with 138,022 tons. There was an increase of 15,216 tons in the quantity of wool handled, while the imports of softwood increased from 406,213 tons to 432,378 tons.

The net registered tonnage of shipping which entered and left the port of London, and paid river-tonnage dues during the year ended March 31, 1911, amounted to 29,395,636 long tons, compared with 28,579,648 tons for the previous year, of which 19,656,193 represented foreign and 9,739,443 coastwise tonnage. The shipping that used the docks represented 18,153,781 tons, of which 15,494,286 tons were foreign and 2,659,495 tons coastwise. The shipping that entered the dry docks of the port of London aggregated 2,235,295 gross tons.

Improvements are contemplated by the port of London authority involving an expenditure of about \$70,000,000. The improvements that are necessary without delay include the construction of new docks and the extension of old ones, further railway facilities, the installation of modern equipment, and dredging. The construction of the new dock will be commenced without delay. It will have an area of 65 acres, the quays will be 9,200 feet long, and the dock proper 4,600 feet long.

---

### CHINESE TIN AND ANTIMONY.

[From Consul General Samuel S. Knabenshue, Tientsin.]

Americans seek information in regard to Chinese exports of pig tin and antimony regulus. Neither of these metals is found in North China. Antimony is found in western Central China, and tin also in that region and in the extreme southeast. The Yangtze River runs eastwardly through the center of China, coming to the sea at Shanghai. The West River, farther south, flows eastward, reaching the sea in the vicinity of Canton. These are the trade routes for these exports. Tientsin is 750 miles north of Shanghai, and hence products of Central China never reach Tientsin for export.

The total exports of antimony regulus in 1910 were 152,077 piculs of 133½ pounds each, the share coming through the various ports being in piculs as follows: Changsha, 133,550; Yochow, 15,624; Hankow, 2,418; Shanghai, 81; Wuchow, 320; Nanning, 84.

The exporting points for pig tin, with the quantities exported in 1910, also in piculs, were as follows: Shasi, 3; Changsha, 17; Hankow, 625; Wuhu, 1; Canton, 1,176; Kowloon, 147; Samshui, 6; Wuchow, 4,276; Mengtsz, 102,465; total, 108,716 piculs.

[From Consul Julian H. Arnold, Amoy.]

In regard to securing supplies of Chinese pig tin and antimony regulus, it may be stated that neither of these commodities is mined at present in this district. However, there is reason to believe that much antimony will be produced here as soon as the mines of this district are opened.

---

*Chassis exports* from Great Britain totaled 380, averaging \$1,750 each, during the first four months of this year, against 223, averaging \$2,000 each, in the 1911 period, and 146, averaging \$1,660 each, in the first four months of 1910.

**MOTOR BOATS IN NEW ZEALAND.**

[From Vice Consul General Henry D. Baker, on special detail.]

There are about 4,500 motor boats in use about the coast and on the lakes of New Zealand. About 3,000 of these are in the northern part of the Dominion, chiefly about the harbor of Auckland and the Hauraki Gulf and in the Bay of Plenty. About 1,500 are in use in the South Island, of which about 1,000 are in the sounds which deeply indent the north coast of the South Island between the towns of Nelson and Picton.

The demand for motor boats for navigation of the more sheltered waters of New Zealand is steadily increasing, and it would seem that notwithstanding the large number that are always being built locally, and the 20 per cent protective tariff favoring a local industry, there ought to be a good market here for American motor boats of attractive style, good power, and reasonably low price.

**Prices of Engines and Boats.**

Of the motor boats in the Dominion the greater number were built locally but with American engines, the largest number of engines for this purpose coming from San Francisco. The American engines are easily the favorites over all others, notwithstanding a certain amount of competition with English and local engines. Local dealers in American engines make excessive profits on their sales, usually amounting to 50 per cent or more. For instance, one engine which sells in the United States for about \$400 sells in New Zealand, excluding the duty paid, for about \$650. These engines are mostly handled by firms which either make the boats themselves and get large profits in this way also, or else arrange to have them built by other concerns which may be in the boat-building business and whose cost of construction and greater profit are usually both quite high.

Owing to high cost of labor and the profits which are exacted on each boat built, as well as on the engines, the cost of motor boats in New Zealand is unduly high, and would probably greatly restrict the use of motor boats were not their particular advantages for New Zealand very marked and were not the local population especially enthusiastic over the pleasure and convenience derived from motor boating. The average price for an ordinary cabin or raised deck motor launch in New Zealand, without the engine and with dimensions 30 by 7 by 2½ feet is \$750. If an equivalent motor launch exclusive of the engine were to be put on the market here by American motor boat manufacturers for, say, \$500 landed cost, the result in sales ought to be very satisfactory. Some motor boats sell here for much more than \$700, but the one referred to would be of rather a plain type. Some also of less dimensions are sold relatively cheaper, and it is the cheapest motor boats that have the best demand; the present tendency is to put less material and workmanship in the boats and so sell them cheaper. Of course the local motor boat builders with their relatively small output are at a decided disadvantage as compared with their American competitors, who have far better facilities for building in large numbers a cheap type of good boats.

**The Boat-Building Center.**

The chief center of New Zealand's motor-boat industry is Auckland, where there are about 10 establishments, capable of building

from 2 to 15 boats at a time, about two months being usually required for constructing each boat. Altogether about 50 boats are built every two months at Auckland, or about 300 boats annually. There are also establishments for building boats at several towns in the South Island, chiefly Picton and Dunedin, with a total capacity, however, of not more than about 50 boats per year.

In addition to the long coast lines of the North and South Islands of New Zealand, which have deep indentations in some parts, especially suitable for motor boating, there are also some rivers, especially the Waikato and the Wanganui in the North Island where such boats are of service, and on many of the lakes of New Zealand they have a very popular use, and in some instances are really a necessity for getting about. There are 9 lakes in the North Island having an area of 5 miles or over, and 18 lakes in the South Island with an area upward of 5 square miles each.

#### **Many Scenic and Fishing Attractions.**

Some of these lakes are frequented every year by hundreds of tourists from all parts of the world on account of their scenic attractions and the remarkable catches of fish which they offer to sportsmen. The best-known lakes are Lake Taupo, with an area of 238 square miles; Lake Rotorua, 32 square miles; and Lake Tarawera, 15 square miles, all situated within the famous volcanic and thermal springs district, and which are claimed to have the largest trout in the world. In this district there is one small lake—Rotomahana, 3 miles square—which affords a unique instance of motor boats navigating in hot water. At one edge of the lake the water is almost boiling, but tourists are taken over it in motor boats to view the famous steaming cliffs. In the eruption of Mount Tarawera in 1887 a great convulsion occurred in this lake, and the water from it boiled over into the surrounding country for many miles.

In the South Island of New Zealand there is a noted chain of cold lakes, the two leading ones being each over 100 miles square, and on these lakes motor boats are the leading means of communication and of affording pleasure and sport to tourists.

There is a very important use in New Zealand of auxiliary oil engines for sailing coasters and for hoisting cargoes, about 5-horse-power motors being most common for such purposes. Particularly about the northern coast of the North Island there are many schooners and other craft fitted with auxiliary screws driven by motors.

There are numerous boating clubs in New Zealand and the Power Boat Association, with headquarters in Auckland. There is probably no more popular form of amusement in New Zealand than the boating attractions afforded by the waters within easy access of most of the population.

---

#### **Delhi Electric Tramways.**

The Delhi Electric Tramways & Lighting Co. (Ltd.) has applied to the Punjab Government for an extension of the area to which it may supply electric power so as to include the Government quarter of the new capital.

---

*The slate output* last year was valued at \$5,728,019, a decrease of \$508,740 from 1910, trade conditions being somewhat unsettled.

## FOREIGN TRADE OPPORTUNITIES.

(Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.)

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8884. Lumber of various kinds.**—One of the commercial agents of the Department of Commerce and Labor, reporting on the lumber markets in a certain European country, writes that there is an immediate demand for 2, 3, and 4 inch ash planks, 22 feet and longer, firsts and seconds; clear white oak logs, round or squared, peeled or unpeeled; octagon hard maple mangle stock 5 by 5 inches, 6 by 6 inches, 24 to 26 inches or multiples thereof in length; hard maple shoe-last stock 12 inches in length, turned and tapered in the rough; ash boat oars, all sizes (finished); elm hubs 6 by 6 inches, 6½ by 6½ inches, 8 inches long. Correspondence regarding this matter should be addressed to a firm whose name is given in the report.
- No. 8885. Theater and other buildings.**—The American consul general at Constantinople, Turkey, reports that announcement is made of the renovating of the Municipal Garden with the construction of a winter and summer theater and certain stores in conformity with plans. Bids will be received until June 13, 1912, when they will be opened in the presence of the bidders. Those who desire to participate in the bidding are requested to write for the (cahier des charges) conditions of the contract to Le Conseil de la Prefecture de la Cille, Constantinople, Turkey.
- No. 8886. Distilled alcohol.**—A business firm in Turkey has informed a commercial agent of the Department of Commerce and Labor that it desires to handle distilled alcohol of 95° or 96° proof (metric system) or 190° to 192° American system. There appears to be a good market for this product, and the report states this is a splendid opportunity for exporters of this material to do a good business. The firm is said to be strong financially and is in a good position to secure trade. Correspondence in French is preferred.
- No. 8887. Coaling stations.**—The American consul general at Ottawa, Canada, reports that the commissioners of the Transcontinental Railway have advertised for tenders, to be received until May 31, 1912, for the construction of six 200-ton mechanical coaling plants, with sand houses and track approaches, to be erected at Moncton, New Brunswick; Napadogan, New Brunswick; Edmunston, New Brunswick; Grant, Ontario; Calvert, Ontario; and Armstrong, Ontario; also for a 1,000-ton coaling station with approach at Cochrane, Ontario. Plans and specifications may be seen at the office of the mechanical engineer, Ottawa, Ontario, Canada.
- No. 8888. Steam road rollers.**—An American consul in the Far East reports that a municipality in his district contemplates the purchase of a number of various sized steam road rollers, and manufacturers are requested to send descriptive catalogues, with prices and discounts and shipping weights, to the municipality so as not to be there later than June 15. At the same time extra copies of catalogues, with prices, discounts, etc., should be sent to the consulate submitting the report for the catalogue library. It is imperative that prices be given; otherwise no action will be taken regarding the products.
- No. 8889. Cotton goods.**—Several important foreign importers and dealers in cotton goods are anxious to handle American cotton goods and would like to hear from exporters who are interested in this matter. These names are furnished by one of the commercial agents of the Department of Commerce and Labor who has personally interviewed the importers and who states that this is an excellent opportunity for American manufacturers to form good connections and secure a large share of the trade. The kinds of goods which are most widely sold are 36-inch, 3 and 3.50 yard sheetings, bleached goods, prints, gingham, duck, drills, flannels, and printed handkerchiefs of all kinds. Correspondence should be in French, but English is understood. Names of the firms referred to can be obtained from the Bureau of Manufactures.
- No. 8890. Light buggy.**—An American consul reports that a Government official in his district desires to be placed in communication with American manufacturers of light buggies. He saw one recently and thinks it is well adapted to the conditions of the country in which he is located. Firms are requested to make prices as moderate and conditions as reasonable as possible, with a view to future orders. Prices should be quoted c. i. f. port of destination. Correspondence should be addressed to the consulate, for transmission to the inquirer.

## THE GERMAN BERLIN AEROPLANE EXPOSITION.

[By Consul General A. M. Thackara, Berlin.]

An International Aeroplane Exposition, the second in Germany, was held in this city April 3 to 14, 1912, in the exhibition buildings erected in the grounds of the Zoological Gardens. It was organized under the auspices of the Imperial Automobile and Aero Clubs, and the Association of German Motor Vehicle Manufacturers, Prince Henry of Prussia, the brother of the German Emperor, being the patron. The exhibition in every way was a brilliant success. The halls were filled to their utmost capacity every day, and only the fact that the buildings were engaged for other purposes prevented the aeroplane exposition being prolonged for two weeks. The visitors were from every class of society, including many military and naval officers.

### Range of Exhibits.

There were 176 exhibitors in all, divided as follows: 22 firms, companies, and individuals exhibiting aeroplanes; 18 exhibiting aeroplane motors; 6 special steel for aeroplane construction; 5 special machine tools; 41 accessories; and 84 displaying miscellaneous exhibits only indirectly connected with the aeroplane industry. Under accessories are included such articles as magnetos, radiators, ball bearings, oils, lubricators, spark plugs, etc.

There were few foreign exhibits, and these were displayed by German firms and companies who are the agents for the sale of the products in this country. Schuchardt & Schütte, of Berlin, exhibited a fine line of American tools, all in operation at their full capacity, which attracted great attention.

### The Biplane Most Satisfactory in Germany.

About 27 German firms are building aeroplanes exclusively and about 24 more constructing them in addition to other products. Many of the aeroplane factories are small, but some of them represent a fairly large capital. [A review of German aeroplane factories appears on page 841 of this issue.] It is estimated that there are 400 to 500 aeroplanes in use in Germany; 214 pilots, both officers

and civilians, who may be called on for military duty, have been licensed by the German military authorities.

Of the 40 aeroplanes shown at the exposition, 30 were monoplanes, 9 biplanes, and 1 triplane. This proportion is somewhat misleading as to the relative popularity of the types, as the biplane is employed by several of the German firms that have had the most success, such as the Euler, Wright, Albatross, etc., while many of the monoplanes shown were largely experiments by unknown firms. For military purposes, at least, and in general when the greatest speed is not essential, the biplane seems to have proved the most satisfactory in Germany.

#### **Intense Scientific Work on Aeroplanes.**

In general, the designs followed closely the various French types and there was an absence of freak machines such as are generally to be seen at such expositions. Of course, a number of the aeroplanes were somewhat crude and several will probably never leave the ground, but the general principles seemed to be understood, and in the case of the well-known firms the execution and finish were good.

For the present America has little to learn from Germany in the actual design of aeroplanes, as their ideas and lines still come largely from France and America. This condition will probably not obtain much longer as, now that it is generally accepted that, with or without dirigible balloons, an army must have a fleet of fast, reliable aeroplanes, the problem is being attacked from every side by the aviator in the field and the scientist in his laboratory. It is evident from the extensive exhibit of scientific instruments for carrying on experiments of all kinds connected with the aeroplane and its accessories that the Germans intend to find out all that is possible from a laboratory point of view.

#### **Various Types Shown.**

The following brief description of a few of the most notable types of aeroplanes will give an idea of the general trend and progress:

##### **THE ALBATROSS.**

One of the finest in appearance was the Albatross military biplane, 1912 type, manufactured by the Albatrosswerke, G. m. b. H., Johannisthal b. Berlin. Its upper planes, much larger than the lower, are shaped and warped much along the lines of the wings of the bird from which it takes its name. The tips are flexed by suitable wires to maintain stability. The wings are spaced and supported by diagonal, instead of vertical, braces and the usual wire ties. The body, on a level with the top planes, is of highly polished wood and is shaped like a flat-bottomed boat cut away forward. The four-cylinder 100-horsepower Argus motor is placed forward of the planes and a Chauviere propeller is bolted to the forward end of the crank shaft. The two seats are immediately behind the motor, that of the pilot being the farthest forward. A large searchlight operated by a small dynamo is fitted adjacent to the pilot's seat. The planes are impregnated with Cellon-Emallit (see later) to render them weather and oil proof and to insure smoothness. All the steel wires, etc., are weather proof, and the steering gear is nickel plated. The steering cables are duplicated throughout. The spread of the planes from tip to tip is 13.3 meters (43.6 feet), length over all 10.7 meters (35.1 feet), and supporting surface about 40 square meters (430.5 square feet). The weight of the machine empty is 480 kilos (1,058.2 pounds), and the speed 90 kilometers (55.9 miles) per hour. The running and landing gear consists of two skids to each of which a pair of wheels is attached by rubber straps. The finish and general appearance show great attention to details.

On this stand two pictures attracted much interest. The first was of a dirigible balloon surrounded by aeroplanes and evidently at their mercy; the legend was "30

Albatross cost no more than one Zeppelin." The second picture showed a battleship the sky above which is filled with aeroplanes. The words under this were "2,500 Albatross cost no more than one dreadnought."

#### THE EULER.

August Euler, Gallusanlage 1, Frankfurt on the Main, showed three types, one a 1911 biplane that has made a large number of flights, the most interesting of which was one of 50 kilometers (31 miles), with Prince Henry of Prussia as passenger. The second was a hydro-aero-triplane, the general construction of which is the same as that of the biplanes made by this firm, except for the floats and the small extra supporting planes placed quite low, underneath the body, in order to give extra lifting power. The single main float is immediately under the center of the machine and is designed to support all the weight on the water. A small cylindrical float, normally out of water, is placed at each extremity of the lower plane to prevent capsizing. The third aeroplane shown was the 1912 military type. The lines of the Farman construction are closely followed. The two seats for the passenger and pilot are well forward of the planes. At the rear is the 7-cylinder 100-horsepower Gnome motor. The elevating and steering planes are single instead of double, as in the last year's model. Stability is obtained by small flexible planes at the extremities of the upper main planes. The struts and ties are carefully worked out. No attempt is made to close in the seats and motor with a body, as in the Albatross and other types. This firm is the most in favor with the army, and more than half the pilot officers have received their instructions and passed their examinations on this type.

#### GOEDECKER.

The body of this aeroplane, made by Flugmaschinenwerke J. Goedecker, Niederwalluf a. Rhein, is of shallow troughlike shape tapering away to nothing at the rear. The 75-horsepower vertical motor is placed forward with the propeller bolted to the crank shaft. The most noticeable feature is the framework supporting the planes. It consists of three steel tubes running the length of the planes, the rods connecting the ends forming a triangle with its base upward. Numerous struts and tie wires give this construction great rigidity. The running and landing gear is made up of three wheels elastically attached but without skids. The spread of the planes is 14.5 meters (47.6 feet); length over all, 9 meters (29.5 feet); supporting surface, 35 square meters (376.7 square feet); motor, 75-horsepower; and speed, 100 kilometers (62 miles) per hour. Stability is obtained by warping the extremities of the wings.

#### THE LOUTZKOY 200-HORSEPOWER MONOPLANE.

The most powerful aeroplane exhibited was the Boris Loutzkoy monoplane, manufactured by Direktor Boris Loutzkoy, Victoria Louise Pl. 1, Berlin W. 30. It is fitted with two 100-horsepower Argus motors arranged tandem in the forward part of the body, each driving an independent propeller revolving around the same hub. One propeller is driven by an extension of the crank shaft of the forward motor. The second motor is placed behind and a little below the first, so that a shaft extending forward under the first motor drives a sprocket, which is connected by a short chain to a sprocket bolted to the hub of the second propeller. With both motors working, a speed of 150 kilometers (93 miles) per hour is claimed. The machine can fly, however, with either motor alone. The weight with pilot, one passenger, and supplies for a six-hour's flight is 1,400 kilos (3,086.5 pounds). The span is 19 meters (62.3 feet), the length 15 meters (49.2 feet), and the supporting surface 52 square meters (559.72 square feet).

#### WRIGHT.

Two Wright aeroplanes were shown, one made by the German Wright Co. (Flugmaschine Wright Gesellschaft m. b. H., Kleiststr. 8 III, Berlin W. 62), and conforming in every way with the latest American model. The second was the historical machine with which Wright made the first flight in Germany in the fall of 1909 at the Tempelhofer field.

#### RUMPLER.

A great deal of attention was attracted by the Rumpler Dolphin monoplane, manufactured by the E. Rumpler Luftfahrzeugbau G. m. b. H., Siegfriedstr. 202, Berlin-Lichtenberg, which is supposed to be the last word in aeroplane luxury. The body is of boat-like form with the motor and propeller forward. Immediately behind are the two seats arranged tandem. The motor is closed in by a hood much like an automobile, and the seats, which are luxuriously upholstered in leather, are covered by a curved wooden top so that the passengers are as well protected from the weather as in a limousine car. Large celluloid windows are provided on the sides and forward for observation. The appearance is very much like that of a dolphin, from which it is named.

**Display of Motors.**

From a technical point of view the motors formed the most interesting part of the exposition. A great deal of study and work had been spent on the design and execution of the various types, and in some cases the results were quite satisfactory. Besides the ones on the aeroplanes, there were 41 motors exhibited by 18 different firms, 5 of which showed rotary motors. The Argus, Dixi, Daimler, and N. A. G. seemed to have attained the best results along accepted lines, while Baumbacher, with a double-piston two-cycle motor, and Oerlikon, with a double-opposed horizontal motor, showed novelties. The following brief descriptions will give an idea of the principal characteristics, while the table at the end will give the general tendencies. On the whole, it can not be said that Germany is on an equality with France, but is making great progress, and will probably be so in a few years.

**THE ARGUS MOTOR.**

The Argus motor, manufactured by the Argus Motoren Gesellschaft m. b. H., Flottenstr. 39/40, Berlin-Reinickendorf-Ost, has four vertical cylinders cast in pairs, water jackets integral. Both inlet and exhaust valves are on top of the cylinders set along the line of the axis of the motor and are mechanically operated by push rods and rocker arms from a single cam shaft which is inside the crank case. Carburetor and admission pipes are on one side and exhaust on the other. Crank shaft is cut from the mass, bored out for lightness, and mounted on ball bearings. Connecting rods are also cut from the mass in such a way as to get the greatest strength for the weight. Outside the forward end of the crank case are the gears for the cam shaft, magneto, and water pump, all uninclosed. On the rear end of the crank shaft is a special flange for the propeller. The rear ball bearing of the crank case is specially designed to take up the thrust or pull of the propeller. Ignition is by Bosch high-tension magneto, spark plugs being in the side just below the intake valves. The workmanship and finish are good. Various types were shown, the dimensions of which may be seen in the table on page 838.

**THE DIXI.**

The cylinders of the Dixi motor are cast separately with the water jackets integral. A specially large gear-driven centrifugal pump insures efficient cooling. The inlet valves are on the top of the cylinders and are operated by push rods and rocker arms from the same cam shaft as the exhaust valves which are on the sides and are operated by ordinary valve tappets. Both valves are of very large dimensions. The crank case is divided laterally into two parts, the lower part serving as an oil reservoir. Ignition is by Bosch high-tension magneto combined, in the larger types, with storage batteries for starting. The carburetor is provided with a hot-water jacket and draws the air from a heating chamber. The oil pump is inside the crank case and is driven by an eccentric from the crank shaft. The crank shaft and connecting rods are bored out to carry oil, which is pumped in large quantities, the overflow returning to the lower part of the crank case. An interesting feature of the Dixi motor is the lightness of the pistons, which are made of a hard composition of aluminum. In a test on the blocks a 100-horsepower Dixi motor was run for four hours, developing 116 horsepower all the time. The pistons showed no ill effect as a result of this trial. The Dixi was exhibited by Dixi Luftfahrt und Bootsmotoren Verkaufs Gesellschaft m. b. H., Bülowstr. 11, Berlin.

**THE DAIMLER.**

The highest horsepower Daimler motor is rated at 125 to 165 at from 1,100 to 1,600 revolutions per minute. It has four vertical cylinders 165 by 175 millimeters (6.50 by 6.89 inches) cast in pairs with water jacket integral. Both valves are on top of the cylinder set along the line of the axis of the motor, and are mechanically operated by push rods and rocker arms from cam shaft. Cam-shaft gears are forward and uninclosed. Oiling is by automatic drip oiler driven from gears on rear end of cam shaft. Ignition is by Bosch high-tension magneto. A decompressor is provided for starting.

The newest type produced by the Daimler company is of 65 to 75 horsepower at from 1,250 to 1,400 revolutions per minute. The four vertical cylinders, 120 by 140 millimeters (4.72 by 5.51 inches), are cast in pairs with water jackets and valves as above. The cam shaft is inclosed inside the crank case and driven by a gear mounted on the

middle of the crank shaft. The water pump, oil pump, and magneto are grouped together and driven by the same shaft. The oiling system is entirely inclosed in the crank case, the lower part of which serves as an oil reservoir. The motor is designed so as to offer the least possible resistance to the air and the result is very pleasing. The manufacturer is Daimler-Motoren Gesellschaft, Stuttgart-Unterturkheim.

#### THE NEUE AUTOMOBIL GESELLSCHAFT (N. A. G.) MOTOR.

The four vertical cylinders are cast separately without water jackets, which are made of copper and fitted afterwards. Valves in top of cylinders all mechanically operated by push rods and rocker arms from cam shaft inside of crank case. Admission and exhaust ports are on the same side. The crank case is cast in one piece and has an oil reservoir in the bottom. The oil is delivered in large quantities and the overflow is allowed to return to the tank after having been strained.

In the 100-horsepower and 150-horsepower types the crank case is made in two pieces. The latter model has six cylinders, but the general construction is the same except that double ignition is provided by two high-tension magnetos mounted on opposite ends of a short horizontal shaft at right angles to the crank shaft, from which it is driven by helicoidal gears. The manufacturer is Neue Automobil Gesellschaft m. b. H., Berlin-Oberschoneweide.

#### THE BAUMBACH TWO CYCLE.

One of the most original motors shown was the Baumbacher two-cycle double-piston type, manufactured by W. Baumbach, Leipzig-Kleinschocher. The cylinders are cast in pairs and are each bored out to two diameters, the upper half to 110 millimeters (4.3 inches), the lower to 150 millimeters (5.9 inches). The operation is as follows: As the piston descends a certain amount of vacuum is created in the lower half of the first cylinder. When this piston reaches its lower dead center it uncovers a port connecting with the crank case. Through this port the lower part of the cylinder is filled with the gases previously admitted to the crank case. As the piston rises it compresses the gas in the lower half of the cylinder. When it reaches the top dead center the piston of the next cylinder, having just reached its bottom dead center, uncovers a port connecting the lower half of the first cylinder, in which is the compressed charge of gas, and the upper half of the second cylinder in which are the burnt gases that have just finished expanding. Just before this point in the cycle, a mechanically operated exhaust valve in the top of the second cylinder has been opened so that all the pressure in the second cylinder has escaped, and the fresh gas rushing in fills the cylinder and drives out the remaining burnt gases. The second piston then rises and compresses its charge, which is fired at the proper point. The lower half of the second cylinder supplies the gas for the upper half of the first cylinder in the same manner. The cylinders are arranged in pairs, fan fashion, and as many pairs may be used as desired. Fourteen cylinders is the largest motor that has yet been designed of this type.

It follows, of course, from the above explanation that one explosion is given for each cylinder for each revolution. The new features claimed for this motor are: First, the mechanically operated exhaust valve, which allows all pressure to escape before the inrush of the fresh gases which are under considerable pressure, thereby obtaining complete scouring and a full charge; second, owing to the fact that the gases in the crank cases are at atmospheric pressure or below, specially tight joints are unnecessary, and the crank case does not have to be divided up into as many divisions as there are cylinders, which is the case in ordinary two-cycle motors; third, freedom from scoring of the cylinder walls, due to the burnt gases passing through ports in the part of the cylinder traversed by the piston; fourth, as the exhaust valve and intake port are at opposite ends of the cylinder, no baffle plate is needed on top of the piston and the burnt and fresh gases have no tendency to mix, which insures economy. There is, of course, a certain amount of loss of energy due to the work done in compressing the fresh gas in the lower half of the cylinder and then allowing it to expand into the upper half of the next cylinder. It is claimed, however, that this loss is more than compensated by the increased efficiency of the motor.

#### THE BUCHERER REVOLVING MOTOR.

This motor has four air-cooled cylinders arranged in the form of a cross. At 1,200 revolutions per minute it is said to develop 52 horsepower, which is about 9 horsepower per stroke liter. The total cubic capacity of the cylinders is 5.7 liters (6 quarts). It is claimed that the Gnome motor only gives 6.9 horsepower per liter.

Remarkable results are claimed for this motor on account of its long stroke and the special patented construction of the piston and rings. The crank case is of cast aluminum reinforced by chrome nickel steel bands to take up the strains of centrifugal force. The valves, instead of being on the tops of the cylinders as in most rotary

motors, are both on the sides and mechanically operated. This permits them to open outwardly from the center following the lines of the centrifugal force and avoids the difficulty often experienced of valves not opening at high speeds, as the effect of centrifugal force is to tend to hold them closed when they are placed on the tops of the cylinders. The manufacturer is Max Bucherer, Köln-Lindenthal.

#### THE OERLIKON.

The Oerlikon motor is designed to reduce weight to the lowest point consistent with durability. The cylinders are cast separately and are mounted in pairs in a horizontal position on opposite sides of an open square aluminum casting. The crank-shaft ball bearings are carried by the two other sides of the square. The crank shaft is made of hollow steel tubing bent to shape. On one end is the propeller hub and a gear for driving the water and oil pumps. On the other end is the gear for driving the cam shaft, to the end of which is coupled a high-tension magneto. The valves are operated by long rods and rocker arms and are placed in the heads of the cylinders. The connecting rods are mounted on ball bearings, and together with the crank shaft are exposed to the air, as the crank case is not housed in. The advantages claimed for this motor are extreme lightness, freedom from vibration, and efficient cooling, making long runs possible without heating up. The manufacturer is Schweizerische Werkzeugmaschinenfabrik, Oerlikon, Switzerland.

TABULAR SUMMARY OF MOTOR FEATURES.

\* This is a 2-cycle motor.

\* The cylinders are double opposed and the crank case open.

#### Accessories and Specialties.

Aside from the aeroplanes and motors, several exhibits were of a certain amount of interest, such as built-up wooden tubes, Cellon Emallit, a leather propeller, and other specialties.

#### HOLZBANDROEHREN OR WOODEN TUBES.

This material exhibited by the System Mutter, Vertriebs Büro, Bülowstr. 73, Berlin, attracted considerable attention by its lightness and strength. It is built up of long

strips of wood cut from the tree along the hard rings that mark yearly growth and with the grain so that there are no soft spots in the strips. The tubes are generally made of four layers. The first layer is wound so as to give the desired form; the second is made up of enough strips wound parallel so as to make the pitch of the winding about 45 degrees; the third layer is the same as the second except that it is wound in the opposite direction; the fourth layer is made up of strips laid on parallel to the axis of the tube. Between each layer, as well as on the outside, is a special preparation that binds the whole together and renders it entirely water and weather proof. On account of the way in which the tube is constructed, and as it is protected from the weather, it does not warp or work. Although the ordinary cross section is round, any desired form may be given such as V, U, triangle, square, channel, etc. For very heavy work built-up sections are made. It is claimed that size for size these tubes are stronger than wood in the proportion of 45 to 13. They are, of course, far lighter. The weight of a tube 49 millimeters (1.9 inches) outside and 40 millimeters (1.6 inches) inside diameter is given at about 480 grams (1.06 pounds) per meter length.

A series of tests carried on by Prof. Bach of the Physikal Institut der Hochschule, of Stuttgart, gave the following results:

In tension a tube 50 centimeters (19.7 inches) long [ $d=40$  millimeters (1.6 inches),  $D=49$  millimeters (1.9 inches)] supported 2,410 kilos (5,313.1 pounds) with an elongation of 1 millimeter (0.04 inch).

In a second test a piece of the same dimensions showed an elongation of 2 millimeters (.08 inch) at 2,000 kilos (4,409.2 pounds) and 4 millimeters (0.16 inch) at 2,270 kilos (5,004.5 pounds).

In the tests for breaking with the supporting points 50 centimeters (19.7 inches) apart, the following results were obtained:

First test.		Second test.	
Weight.	Flexion.	Weight.	Flexion.
100 kilos (220.4 lbs.)...	2.5 mm. (0.10 in.)	100 kilos (220.4 lbs.).....	2.0 mm. (0.08 in.)
200 kilos (440.8 lbs.)...	5.5 mm. (.22 in.)	200 kilos (440.8 lbs.).....	4.0 mm. (.16 in.)
300 kilos (661.2 lbs.)...	9.0 mm. (.37 in.)	300 kilos (661.2 lbs.).....	5.5 mm. (.22 in.)
398 kilos (870.8 lbs.)...	14.0 mm. (.55 in.)	400 kilos (881.6 lbs.).....	7.5 mm. (.30 in.)
		490 kilos (1,080.3 lbs.)...	12.0 mm. (.47 in.)

#### A LEATHER PROPELLER.

A propeller that is practically indestructible was shown by the Aeroplan-Compagnie Trier, Trier. A core or frame is formed by two nickel steel bars about 12 millimeters (0.47 inch) in diameter that run from one end of the propeller to the other, nearly parallel to each other but so shaped as to give the proper curve to the blades. On these two bars are threaded strips of leather, the length of which corresponds to the width of the blade. The leather is pressed together and then shaped and finished so that it is difficult to distinguish a propeller so made from an ordinary wooden one. The finish is good and the strength must be very high owing to the steel core. Of course, any shape desired may be given the blades.

#### A UNIQUE RADIATOR.

A radiator that has been adopted by a number of the German aeroplane manufacturers was shown by Haegele & Zweigls, of Esslingen am Neckar. It is built up on the unit principle. Each unit has the appearance of a honeycomb-type radiator of the usual height and depth, but only wide enough to form passages for two thin sheets of water. The top and bottom of each section is attached to a pipe about 25 millimeters (1 inch) in diameter the length of which is slightly in excess of the depth of the radiator section. The axis of this pipe is slightly offset from the plane of the sections. At one end of the pipe is a male cone and at the other a female cone, so that any number of these sections can be built up one behind the other. The sections are secured by two tie rods that run through the center of the pipes at the ends of the sections. As the pipes are slightly offset, the sections are in echelon, which gives them great cooling efficiency. This form of radiator is very easily applied to the side of the body of an aeroplane or in any other position. The advantages claimed are great efficiency due to the large amount of surface fully exposed to the air, lightness on account of the thinness of the film of water that is allowed to pass, and the fact that, owing to the method of securing the units together, torsional movements of the chassis are easily taken care of and in case of accident or leaks one or more units are easily replaced.

## A STEEL BODY.

The Stahlwerke Becker of Willich-Krefeld exhibited shell or body designed to protect the aviator and motor of an aeroplane from small-arm fire. It is made of specially tempered steel, 2 millimeters (0.08 inch) thick, and weighs 34 kilos (75 pounds). Its dimensions permit the housing of the motor, steering gear, and control levers as well as the seat for the aviator. In testing, about 40 shots were fired at this body from various angles at a distance of 250 meters (820.2 feet) from the regulation German Army rifle. None of the shots penetrated or caused any damage.

## CELLON EMAILLIT.

Up to the last year or so canvas impregnated with rubber has been generally used for the covering of the planes of aeroplanes. This has been open to certain objections such as lack of perfect smoothness and therefore high-skin friction, inflammability due to the canvas becoming saturated with oil from the motor, etc. Cellon Emaillit, exhibited by Dr. Mittner & Co., Dennewitzstr. 26, Berlin, is designed to do away with these objections. When canvas is impregnated with Cellon Emaillit it becomes perfectly smooth and proof against all effects of water, oil, heat, and rays of the sun. The reduction in skin friction has been shown by the Eiffelschen laboratory to be from 12 to 18 per cent. Another advantage claimed is that danger from fire is greatly reduced, not so much from the fireproof qualities of the product as from the fact that it is not at all affected by oil or gasoline, so that the canvas has no tendency to absorb oil. Cellon Emaillit is applied with a paint brush and dries in about an hour. In drying it causes the cloth to shrink from one-half of 1 per cent to 2 per cent, which has the advantage of further stretching the canvas on the planes and taking out any wrinkles that may be there, thus further reducing air resistance. The strength of the material is also greatly increased. According to the tests made by the Conservatory of Arts and Trades in Paris, this increase amounts in the warp to 48 per cent, and in the wool to 53 per cent, as shown by the following table:

Material.	Direction of pull.	Breadth.	Length.	Breaking point.	Strength per meter.
Cotton not treated.	Warp.	50 mm. (1.97 in.).	100 mm. (3.94 in.).	35.5 kg. (78.2 lbs.).	710 kg. (1,565.3 lbs.).
	Wool.	50 mm. (1.97 in.).	100 mm. (3.94 in.).	43.5 kg. (95.9 lbs.).	870 kg. (1,918.0 lbs.).
Cotton treated with Cellon Emaillit.	Warp.	50 mm. (1.97 in.).	100 mm. (3.94 in.).	82.5 kg. (181.7 lbs.).	1,650 kg. (3,634.9 lbs.).
	Wool.	50 mm. (1.97 in.).	100 mm. (3.94 in.).	66.5 kg. (146.6 lbs.).	1,330 kg. (2,932.1 lbs.).

With a good quality of linen impregnated with Cellon Emaillit a resistance of 1,800 to 2,200 kilos (3,968.3 to 4,850.2 pounds) per meter in width has been obtained. Cellon Emaillit can also be applied to goods already treated with rubber, with satisfactory results.

## American Machine Tools.

Among the special machine tools that were exhibited as applying specially to the manufacture of motors, the American tools attracted most favorable attention. The most complete exhibit was that of Schuchardt & Schütte of Berlin. This firm also showed a series of ball bearings that are so constructed as to allow a large amount of flexing or false alignment of the shaft without setting up any undue strains in the bearings. These are especially suitable for work in aeroplanes where the alignment of shafts is exceedingly difficult.

## Motor Cycles in South Africa.

It is quite the thing at Cape Town for motor cyclists to attach side cars, shaped much like bath chairs, making the machine serve as a small tractor. Consul General Guenther adds that there are a few 3-wheel motor cycle delivery carts there, but so far only side cars are used for passengers. There are now 160 motor cycles in use in Cape Town and suburbs, and 315 more in the district.

**GERMAN AIRSHIP AND AEROPLANE INDUSTRIES.**

[From Consul Talbot J. Albert, Brunswick.]

Nothing illustrates the astonishing progress of the age more than the rapid development of aerial navigation. The building of airships and construction of flying-machines have in Germany become full-fledged industries.

There are in Germany three established airship companies. The enthusiasm, about five years ago, of the German people over the successful trip of the Zeppelin airship from Friedrichshaven to Mainz was intense. In a few weeks \$1,500,000 was voluntarily subscribed for further development of the Zeppelin system. Of this sum over \$1,000,000 has been expended in establishing a construction company at Friedrichshaven. However, one misfortune after another has happened to the ships constructed, four being destroyed. No market for the ships built by the company either in Germany or in foreign countries has so far been established.

**Airship Systems and Improvements.**

The Zeppelin is known as the rigid system of airship construction. The Parseval Co., which constructs ships of the nonrigid pattern, has also met with similar difficulties. It was formed in 1907 with \$125,000 capital, which has been increased. Attention was first paid to building small airships, but the competition of the aeroplane became too great. The small airship was found inferior to the aeroplane in speed and not sufficiently superior either in endurance or in transport capacity.

The size of the airships has been increased; *Parseval III* has been constructed with a gas volume of 10,000 cubic meters, propelled by two 6-cylinder motors of 200 horsepower each. It measures 280 feet in length and 49 feet in diameter and is said to have a speed of 38½ miles an hour. On February 28 a trial trip was made from Berlin to Cologne and return. The ship carried seven passengers, 600 pounds of petrol, 3,300 pounds of benzine, and 2,200 pounds of ballast and water. This ship has been accepted by the German war office. As the nonrigid system is favored by the military authorities it has been more successful than the rigid system. The Parseval company has built ships for the Russian and Austrian armies and one is now being built for Japan.

The third airship company is Siemens & Schuckert, which utilizes the semirigid type. Large sums have been expended in developing this system of airships, which are constructed in accordance with the Gross patent. The most powerful German dirigible belongs to this type and has 480 horsepower. It is considered by many as the most successful airship constructed in this country, has a record of 45 miles an hour, and has made 45 trips without accident.

In Germany there is a steady improvement in handling and housing airships. The great difficulties experienced in leaving and in entering the halls or depots have been overcome by building them with exits at each end, or turnable by electricity. Some halls have capacity for two ships. Great improvement has been attained in emergency landing and in manipulating ships in rainy and freezing weather and in adverse winds. There are now airship halls at Berlin, Hamburg, Cologne, Frankfort on the Main, Metz, Königsberg, Thorn, Gotha,

Bitterfeld, Biesdorf, Dusseldorf, Baden-Baden, and Kiel, the last an airship naval station, while a similar one will be shortly built at Helgoland.

#### **Aeroplane Industry.**

A number of German firms are manufacturing flying machines. One of the best known is the Albatross, a \$12,500 limited liability corporation, which constructs one and two deck machines and is patronized by the military authorities. The Automobil und Aviatik Aktiengesellschaft at Muhlhausen builds one and two deck machines and has an aeroplane field at Habsheim and a branch at Johannisthal.

The Deutsche Flugzeugwerke, at Leipzig-Lindenthal, was formed with \$25,000 capital, which has been increased; it also has a branch in Johannisthal. The original inventors of the German one-deck aeroplane are Dorner & Grade, with \$25,000 capital and a trial field at Bork. The Euler company builds one, two, and three deck machines, has an aeroplane field at Frankfort on the Main, and is the only German firm which has no branch at Johannisthal.

The Wright Flugmaschinen Co., in Johannisthal, started with \$125,000 capital, subsequently raised to \$150,000. Of this sum it is said \$50,000 in cash was paid to the Wright brothers, together with \$50,000 value in shares of the company for the use of their patent rights.

The Rumpler company, with \$62,500 capital, manufactures a one-deck machine called "Taube" (dove), said to be much admired for its fine form and graceful flight.

The Luftverkehrsgesellschaft, capital \$375,000, not only manufactures aeroplanes but also conducts a pleasure excursion business with Parseval airships. All these flying-machine companies not only sell aeroplanes but give instruction in the art of flying.

Other companies are the Flugwerke Haefelin, capital \$25,000; the Harlan, which makes the Grulich one-deck machine; and Gostav Schulze, at Berg, which builds a one-deck machine.

Although prizes are continually offered for superior flights and the Government endeavors to promote the aeroplane industry, it is not in a prosperous condition. The numerous fatal accidents arising from defects in flying machines deter people from purchasing. Nevertheless, continual improvements being made in apparatus would indicate that the industry will in time be put on a sound basis.

#### **Aeroplane Accessories—Prize Flights—Aerial Navy.**

The manufacture of screws, motors, and aeroplane attachments of all kinds is not more flourishing than the main industry. The principal motor factories are the Argus, Daimler, and the Neue Automobil-Gesellschaft. Of foreign motors the most popular is the Gnome. The German automobile industry has not engaged much in the manufacture of motors for flying machines. Several large firms have given it up, because there is no prospect of a market corresponding to the expense involved.

The chief patrons of the aeroplane industry are the military and the airmen who make prize flights a business. The German aerial clubs instituted prize contests; in 1911 the value of the prizes amounted to more than \$250,000. The flights overland are very expensive, owing to the frequent failure of the motor to operate and the necessity of landing at unfavorable places with damage to the

machine. The industry is badly affected by the competition of the large number of companies engaged therein. The successful firms are chiefly those supported by the military authorities. Prosperity can only come to the industry by confidence being restored through the increased security of the apparatus.

It is said that the aerial fleet now in possession of the German War Office consists of 2 Zeppelin, 2 Gross "M" ships, and 3 Parsevals. There are privately owned in Germany 2 Zeppelins, 3 Parsevals, and 1 Gross or Siemens-Schuckert. In process of construction or reconstruction are 2 Zeppelins, 3 or 4 Parsevals, and 4 Gross.

### NEW PATENT LAW IN THE NETHERLANDS.

[From Mitteilungen des Handelsvertragsvereins, Apr. 5, 1912.]

An inconvenience which caused a great deal of complaint was the fact that in Netherlands formerly it was impossible to obtain patent protection for inventions, owing to the absence of legal provisions for the granting of patents. Fortunately this has been changed by the Dutch patent law of November 7, 1910. [This law will probably be in effect by June 1, 1912.—Patent and Trade-mark Review.]

According to the "Confectionär" patents are granted in Netherlands for a period of 15 years. There are annual charges, amounting in the first three years to 50 florins (florin = \$0.402) annually; in the three following years, 70 florins annually; from the seventh to the ninth years, 90 florins annually; from the tenth to the twelfth years, 110 florins annually; and in the last three years of the period, 130 florins annually—the charges for the whole 15 years amounting, accordingly, to 1,350 florins (\$542.70). The payment of the annual charges is due on the date of the announcement, and part payment of the charges must be made before the day when the charges are due. The patent must be worked within a period of five years from the date of the announcement of the patent. [An English translation of the patent law is on file in the Bureau of Manufactures.]

### BRITISH FOREIGN TRADE IN APRIL.

[From Consul General John L. Griffiths, London.]

The effect of the coal strike is shown in the trade returns of the United Kingdom for April. The strike did not end until the middle of the month. In view of the demoralization of the transport services, the number of factories that were closed on account of the labor troubles or which were operated on short time, and the great numbers of working people who were thrown out of employment, it is indeed surprising that the level of trade was so well maintained. A noticeable feature of the trade for April was the very marked increase in the imports of cheap raw materials, which is considered, of course, as meaning increased activity in British shops and factories. Imports aggregated \$294,008,342, an increase of \$41,677,324 over April, 1911, while the \$160,045,203 exports showed a decrease of \$13,652,133, of which coal, coke, and manufactured fuel accounted for \$8,944,928.

The Montreal Board of Trade favors granting civic charters to autobus lines.

**FACTORS IN FOREIGN TRADE.**

[From Consul Felix S. S. Johnson, Kingston, Ontario, Canada.]

**Usefulness of the Translation Bureau.**

Nowadays, when nations great and small are engaged in the struggle of commerce, a lack of acquaintance with foreign languages and customs is being recognized as one of the chief drawbacks to development and progress. The time may come when a universal commercial language will be adopted, and business customs will harmonize, one nation with another; but until such time, the ability to translate readily and correctly will be found to be a money-making asset in any commercial or financial house.

Many mistakes, sometimes merely humorous but quite frequently very costly, have been committed in the past by firms content to leave the translation of a foreign business letter to anyone in the office professing a knowledge of the language involved. Unfortunately for the amateur translator, there is a considerable difference between, say, the French of the evening classes and that spoken and written by the commercial men of France. This is why the casual translator, who is quite capable of an intelligent reading of a French novel, sometimes makes errors in the translation of a business epistle which causes more than annoyance.

The wide development of business has brought into the commercial arena countries whose tongues are unfamiliar to the ordinary man. The translation bureau, when adequately equipped, saves the business house all trouble in handling such foreign correspondence. There are in London several bureaux which boast that their translators can correctly render into English the language of any country that is, so to speak, within the pale of civilization. The translators are highly accomplished men, each specializing in a particular branch of the language spoken by the races of the commercial world. They are, moreover, men who have mastered the principles underlying the trade practices and regulations of the countries with whose language they have such intimate acquaintance, and are therefore competent not merely to translate but to make perfectly clear any points which might baffle a university professor who possessed their linguistic ability but who lacked their knowledge of commercial procedure.

The time is coming when the United States will be in the vortex of international trade, and if the business is to be done direct, without the intervention of other countries better equipped, Americans must give heed to this very important question. The establishment of bureaux now probably would not pay in dollars and cents, but their inauguration and maintenance might well be undertaken preparatory to the assumption by the United States of a high place in the international commerce of the world.

[From Vice Consul General Charles Lyon Chandler, Callao, Peru.]

**How Commercial Bodies May Help.**

One of the most interesting results of the consular reform that has taken place since 1906 has been the increasing efficiency of the various agencies, whether official or private, in the United States for promoting foreign trade. The efforts of private parties have been either collective or individual. States, counties, and cities have established or increased the usefulness of their boards of trade or chambers of

commerce; special industries have issued "bluebooks" or directories; and individuals write to consuls letters more specific and practical than formerly, as well as showing a wider knowledge of export requirements.

As it was not until 1911 that any national organization of American chambers of commerce was seriously attempted, it is too soon to expect any national business directory or similar publication, the field for which is at present fairly well supplied by private publications and directories of the larger industries. There are, however, many active boards of trade and chambers of commerce in cities throughout the United States whose literature is not sent to consulates. Only two such magazines are received at this consulate general; only four trade directories published by chambers of commerce are on file here. At other offices where the writer has been stationed there were none at all. For a nation of 94,000,000 people that is singularly little legitimate advertising. Even the State boards of promotion or similar State offices send out very little useful literature.

Many chambers of commerce are divided into sections. Perhaps there is a market for the goods of only one section abroad generally or in some particular country. This should be taken advantage of to avoid useless duplication and wasted effort. Chambers of commerce should, whenever possible, issue literature in foreign languages, especially in Spanish. This will not merely lead to a closer cooperation with similar bodies in the 22 Spanish-speaking countries, but will obviously benefit them in other ways.

[From Consul James W. Johnson, Corinto, Nicaragua.]

#### **Style of Business Correspondence.**

A matter which deserves more attention than is given to it by American exporters is the style of their business correspondence.

There is current in the United States among many business men a style of correspondence which is brief and, at times, abbreviated; which uses the simplest and most direct language, cuts out all unnecessary words, does away with all superfluous expressions, and economizes time to the fullest extent. Letters written in such a style are, perhaps, indicative of modern and energetic methods on the part of the firm using it, but to foreigners, and especially to Latin Americans, such letters appear curt and often convey an impression of rudeness. The merchant of Spanish America, in accordance with the genius of his native language, couches even his business letters in courteous terms, and this he expects from others; the effect can be imagined of receiving a letter in which the writer has not even taken the time to put in the personal pronouns.

It is noticeable that European manufacturers generally in writing to merchants here take the time to send out carefully and politely worded letters; it is certain that American exporters should not use less care or go to less trouble than do their Continental competitors.

---

*Surface combustion.*—The lectures on "surface combustion" delivered in several American cities last fall by Prof. William A. Bone, of Leeds University, have been published in pamphlet form and a copy has been forwarded by Consul Benjamin F. Chase, of that English city. This booklet, which is illustrated, will be loaned upon request by the Bureau of Manufactures.

**THE TRANSVAAL GOLD OUTPUT.**

[From Consul Edwin N. Gunsaulus, Johannesburg.]

The Transvaal gold output in 1911 constitutes another record, showing an increase in value over the previous year of \$14,550,375, the increase in fine ounces being 703,880. The total output for 1911 reached the enormous value of \$170,286,718, of which the Witwatersrand mines produced \$163,239,341. From the total output \$37,779,057 in dividends were distributed.

Ore milled at the mines of the Witwatersrand reached 23,888,258 tons; analysis recovery value, \$6.79 per ton, compared with \$6.93 for 1910 and \$7.04 for 1909. Among the ascribed reasons for this decrease in grade value are the inclusion of payable lower-grade rock, the disorganization caused by native labor shortage, which, in addition to reducing the amount of waste rock sorted out, induces the tendency to work for the moment rather the wider, and consequently the poorer, stopes more suitable for the ordinary type of machine drill, in order that adequate tonnage may be obtained for the mills. The excuse for this course is that idle stamps consume their share of the standing charges.

The average working costs on the Rand gold mines for 1911 are given as \$4.38 per ton, including cost of development, as compared with \$4.28 for 1910 and \$4.16 for 1909. Approximately \$35,000,000 was paid on the Witwatersrand mines during the year in wages, not including about \$5,000,000 in salaries. Administration charges reached \$3,000,000, while it is estimated that fully \$40,000,000 was paid out for colored workers' wages, recruiting fees, food, and native general charges. About \$50,000,000 were also spent in general stores for the mines.

The total number of stamps in operation on the gold mines of the Transvaal in December, 1911, was 10,195, an increase of 420 in 12 months; tube mills in operation, 251, an increase of 61.

It is estimated that the gold output of the Transvaal for 1911 constitutes almost if not quite 38 per cent of the world's output for that period, as against 33 per cent in 1910.

---

**INSURANCE COMPANY GUARANTIES IN PANAMA.**

[From American Minister H. Percival Dodge, Panama.]

Decrees supplementing the one mentioned in Daily Consular and Trade Reports on February 28, relative to the guaranties to be deposited by life and fire insurance companies doing business in Panama contain the following provisions regarding such deposits:

*Resolved*, The National Government guarantees the return within the terms of law 38 of 1911 of the deposits made with the national bank by the insurance companies which establish themselves or desire to continue their business in the Republic of Panama.

*Resolved*, The investment of the deposits which the insurance companies shall make in the national bank in accordance with law 38 of 1911 shall be subject to the following regulations: (1) Every loan which shall be made with these deposits shall require the approval of the board of directors; (2) in no case and for no cause may a person or company be given a greater sum than 5,000 balboas (\$5,000) at an annual rate of interest of not less than 9 per cent and for a term not to exceed six months, which may be prolonged for similar terms through the approval of the board of directors; (3) such investments shall be made with the greatest possible security, whether they are made on personal bonds or mortgages; and (4) a special account shall be kept of these deposits.

**HIGH VALUE OF WASTE METALS.**

[Announcement of Geological Survey.]

The value of secondary metals (those recovered from scrap metal, sweepings, skimmings, drosses, etc.) last year in the United States was \$52,585,390.

Though junk collectors and dealers pay low prices for small quantities of scrap metals, the competition for the scrap, drosses, skimmings, and other waste products of large users of metals is very active. It is necessary for some uses to employ primary or virgin pig metal, but as a general rule secondary metals, in whole or in part, can be used by manufacturers. As they are frequently sold at slightly lower price than the primary metals, they are in active demand and displace an equivalent quantity of primary metal.

The production of secondary metals in 1911 was: Secondary copper, 50,845 tons, worth \$12,711,250; remelted brass, \$16,814,400; lead, 54,254 tons, \$4,882,860; spelter and zinc, 47,937 tons, \$5,464,800; tin, 14,706 tons, \$12,353,040; antimony, \$359,040.

**Recovery of Tin an Important Source of Supply.**

As the production of tin from ore mined in the United States in 1911 was confined to a small amount of metal smelted in Texas and to the shipment of a small yield of tin concentrates from Alaska, the secondary recoveries of tin form the most important domestic source of supply.

The 7,749 tons of recovered tin includes the tin content of products made by several plants from tin scrap. These included some tin oxide, putty powders, etc., but were mainly tin chloride, two forms of which are handled commercially—stannic and stannous salts. Stannic chloride is usually sold either as a water solution, called bichloride of tin, or as an anhydrous sirupy liquid, termed tetrachloride of tin, and is used principally in the silk industry. Stannous chloride is sold in crystals and is used in dyeing and calico printing.

The largest recoveries of tin were made from the scruff and drosses that occur in making tin andterne plate. Practically no clean scrap tin plate is wasted. A large quantity of tin was recovered as tin powder by electrolytic treatment and sold to secondary smelters. Lesser sources of recovered tin reported in 1911 were tin foil, block-tin pipe, and old tin cans. The tin recovered from these sources was relatively small. Old tin cans were used even less than in previous years. The small percentage of tin coating, the varied nature of the used contents, the bulk and cost of collection and shipment, and the difficulty of disposing of the old black plate appear to be serious obstacles to their use. To recover the vast quantity of tin wasted on used tin-coated containers would be a conservation much needed and desired, but it is evident that such material must be capable of very cheap treatment when it is considered that the original clean tin plate usually has not more than 2 per cent tin coating.

**TOBACCO SALES IN AMSTERDAM.**

[From Consul Frank W. Mahlin.]

From a report published by an Amsterdam broker comparing the first five tobacco auctions of 1911 and 1912, crops 1910 and 1911, it appears that the prices of the Dutch East India tobacco were much higher for the Sumatra product this year than in 1911, and for the Borneo product they were lower. This is owing to the better quality of the Sumatra tobacco, together with a greater demand, while the Borneo tobacco was of inferior quality, bad color, and bad assortment.

At the five auctions for 1912 held up to May 3 in this city, 82,433 bales of Sumatra tobacco were sold at an average price of \$0.92 per pound, against 73,476 packages at an average of \$0.79 in 1911. Of the Borneo product, 1,369 packages were sold at an average of \$0.65 a pound, against 3,407 packages at an average of \$0.82 in 1911.

*Panama sugar.*—Consul General Alban G. Snyder notes in the Panama press the statement that samples of the first attempt at sugar manufacture at Pese, Los Santos Province, show the product to be high-grade muscovado, needing little refining.

**PROPOSED ALTERATIONS FOR LONDON WOOL SALES.**

[From Consul Augustus E. Ingram, Bradford, England.]

During the last wool sales in London a meeting of the Colonial Wool Buyers' Association was held to consider certain proposed changes in regulations governing London wool sales. These changes related to the method of selling "star" lots, the extension of the limit for farthing bids, and the privilege extended to the "last buyer." According to the Yorkshire Observer the details of these matters are as follows:

"Star" lots are lots of 3 bales and under and damaged wool. Such lots are marked in the catalogue with a star, and are not offered until all the big lots have been disposed of. It is proposed, as a convenience to buyers of these wools, that "star" lots shall be sold in another room concurrently with the principal sale. This is already the practice in the Australian markets, where it has been found to work very well, and at Sydney and Brisbane the limit for "star" lots has already been raised to 5 bales. The brokers apparently object to the expense of providing another auctioneer, though this could be avoided on days when the catalogues included the offerings of two or more brokers by the selling being so arranged that the broker who was first on the list for the big lots should be last on the list of "star" lots.

Farthing bids may not be made in London after 8d. (16 cents) has been reached. In all the Australian markets, and also in New Zealand, bids are accepted without any limit. The majority of the buyers in London are said to favor raising the limit for farthing bids up to 10d. (20 cents), while some desire 1s. (24 cents). The limit of 8d. was established 24 years ago, when wools were about 2d. (4 cents) per pound less in value as compared with to-day's rates, and hence it is urged that what was right at 8d. in 1888 represented 10d. to-day.

The "last buyer" privilege is that when a number of bids are made at the same price and there is no advance, the buyer of the last lot has the privilege of taking the wool. It is claimed not only that this rule leads to dilatoriness, since the last buyer naturally hangs back to be sure that all the others have finished before he makes his bid, but also that the last buyer, when he does not want a lot himself, may claim it for a friend to the exclusion of other bidders who were beforehand both with the nominal and the actual purchaser.

The London Selling Brokers' Association on receipt of these recommendations replied adversely, and it is accordingly expected that at the next London sales in July interesting developments may be expected.

**SHIPPING TO THE FAR EAST.**

[From an address by Luis Jackson, industrial commissioner, Erie Railroad, before the Chamber of Commerce, Meadville, Pa.]

A practical insight into our export trade was given me recently on a visit to Australia and New Zealand. We were doing an increasing business with Australia. This business was all at once checked. Australia does not require our grain and live-stock products, but it is importing all the higher classes of goods, such as are manufactured in our Eastern States—electric appliances, telephone material, street railway equipment, cotton underwear, machinery, tools, etc.

Through rates were formerly made from manufacturing points in New York and other Eastern States to Australia, New Zealand, Japan, and China. These rates included transportation by railroad across the continent to the Pacific coast and thence by steamer to the foreign ports. These rates were withdrawn, and our business has in many instances fallen off and in others not made the progress it should.

As the result of the withdrawal of these rates, Australia, Japan, and China are now taking some goods via steamers from New York around Cape Horn; and this takes as long as the direct routes from England and Germany via the Suez Canal, so that time is no longer saved, and they are again giving to European manufacturers a great deal of the business we had worked up. Australia, Japan, and China have to order goods many months ahead. I found that in Australia merchants have to keep about four times the stock that an American merchant would keep. Our trans-continental and ocean route, making better time, would enable them to keep less stock on hand and would therefore be an inducement to buy from us.

## TASMANIAN TRADE AND INDUSTRIAL CONDITIONS.

[By Consul Henry D. Baker, Hobart.]

The island of Tasmania, generally speaking, showed fair progress in 1911, notwithstanding serious labor troubles, depression in the mining industry, and heavy losses in potato growing caused by the blight.

Hobart has had the benefit of a steadily expanding export trade in apples, the southern part of the State, especially in the valleys of the Derwent and Hoon Rivers, having become one of the leading orchard districts of the world. Increased attention to dairying near the northwest coast has been a great help to that part of the island. In the mining districts of the west coast, however, conditions were unsatisfactory, due mainly to the strike of the miners at Queenstown, which prevented for over three months operations at the mines, which are among the foremost copper producers of Australia. A number of the miners moved to other States, and there appears to be a shortage of labor to properly operate the mines.

The crops of cereals during 1911 were disappointing in most districts, owing to the prolonged wet weather during the winter and early spring, which so chilled the land in many localities that the seed rotted in the ground. Prices for farm produce were better than in many previous years. Sheep and other stock did well, and good prices were realized for wool.

### Shipments of Tasmanian Apples.

As a fruit-producing State, Tasmania is constantly gaining in importance, the chief market being England, though large shipments are also made to Germany, Sweden, Denmark, South American ports, New Zealand, and the mainland of Australia, and during 1911 a trial shipment of about 30,000 cases was delivered at New York. The 1911 apple season saw the record exportation to the United Kingdom of 719,311 cases, an increase of 33 per cent over the 1910 shipments, while a considerable advance was also made in the export to South American ports. Trade with New Zealand was not quite equal to the 1910 season. The larger exports to Great Britain and South America naturally reduced the available quantity for the Commonwealth, with the result that the fruit sold locally realized much better prices than

the exported product. While the average prices of the exports to Great Britain for the season were good the growers did not realize nearly so well on the latter shipments of apples as those exported early in the season, when Tasmanian apples brought the best prices realized within the last 10 years. The season for shipping apples to England and Europe begins near the end of February and last year extended to the end of May. During last season 32 ships called at Hobart for fruit for export. The apples are kept at a temperature of 33 to 34 degrees during the voyage.

The experimental shipment to New York last year met with disappointing results. The apples were shipped via England, and during transit across the Atlantic were damaged by frost, which conditions were made worse by unusual heat prevailing in New York at the time of their arrival. The local fruit growers are still hoping to eventually find a good market in the United States for their apples during the American spring and early summer, corresponding to the Tasmanian autumn and early winter. A representative of the Tasmanian fruit growers who recently visited the United States stated that in his opinion a good trade might be worked up in time, but advised that to cater for the American market growers should strive to attain good color as well as good flavor for their apples, pack them more attractively, and perfect shipping arrangements so that the fruit would not be damaged in transit.

#### **Returns from the Fruit Industry—Jam Manufacture.**

The total value of the different kinds of fruit produced in Tasmania during 1911 was approximately \$1,537,000, being second only to wool as a leading element in the local production of wealth, the value of the wool produced being about \$2,000,000. The fruit industry, however, gives employment to a far greater number of persons than does the sheep industry.

Many districts of Tasmania, covered with thick scrub and previously supposed to be scarcely fitted even for sheep, are now being planted in orchards, as it has been found that in most cases the soil that is the poorest for agriculture is often the best for growing apples. On the Tamar River, in northern Tasmania, there is a rapid increase in the utilization of land for orchards, and probably within two or three years steamers will call near the mouth of this river for apples for direct export to England.

Connected closely with the fruit industry is the local manufacture of jam, which employs nearly 1,000 persons, with an annual output valued at about \$1,220,000. The output of pears, apricots, plums, strawberries, and raspberries is large, but with the exception of pears, which are exported to other Australian states and to England, these fruits are used mostly for jam making.

#### **Market for Spraying and Fruit-Packing Machines.**

The prosperity of the fruit industry of Tasmania depends chiefly for continued success on spraying to check the ravages of the codling moth, and there ought, therefore, to be an increasing market here for American spraying machines and motors for driving them, and also for American arsenic or lead preparations. It is also found necessary to spray the potato vine to prevent destruction from blight.

The Tasmanian apples and pears are wrapped in paper and packed by hand for exportation, and if an American machine could be intro-

duced here which could effect saving in this direction it should meet with extensive sale. There is also need of a cheaper method of cutting and printing paper for apple wrappers. The Parliament of the Commonwealth of Australia in December, 1911, placed wrapping paper for fruit on the free list. This paper is now imported mostly from Sweden.

#### **Output of Butter and Cheese.**

The dairy industry of Tasmania is rapidly assuming greater proportions and ought to receive the attention of American manufacturers of cream separators and other dairy appliances and machinery. There are about 53,000 cows kept in this island for dairy purposes. The total output of the registered factories during the year ended June 30, 1911, was 2,815,680 pounds of butter, valued at \$611,719, and 423,920 pounds of cheese, valued at \$51,487. The chief export market for Tasmanian cheese and butter is England, such shipments being by way of Melbourne, where they are received and examined at the Victorian Government's cold storage. During the year ended June 30, 1911, the Government cold storage at Melbourne handled 1,439,760 pounds of Tasmanian butter for export to England, valued at about \$321,375. Several new up-to-date butter factories have been erected during the past year, one at Burnie and one at Wynyard, while another is now in course of erection at Scotsdale, and still other factories are being contemplated for the towns of Riana, Devonport, and Baden, all near the north coast. These new factories have full equipment of modern machinery, including mechanical refrigeration and artificial gravitation systems, the cream first being conveyed by elevators to the tops of buildings. The Director of Agriculture of Tasmania, in his recent report to Parliament regarding the prospects of the Tasmanian dairy industry, said in part:

Few parts of the world are so eminently adapted for dairying as Tasmania, as not only is the climate the most favorable of any of the Australian States, but the absence of droughts, the magnificent water supply, and the high feeding value of the grass and other fodder crops are such that the highest quality dairy products can be obtained. This is shown by the fact that according to the information supplied by the representative of one of the largest butter firms of London (who recently visited Tasmania) over 95 per cent of the butter exported from Tasmania during the 1910-11 season was graded first class, a much higher percentage than that gained by any other Australian State, and only some 3 per cent below the New Zealand product, which turns out 98 per cent of first-class butter and which as a consequence realizes a higher price on the London market than that obtained by any other Australian State—a price that the excellence of the Tasmanian produce will be entitled to once its output is in a position to be sold as a Tasmanian instead of an Australian product.

#### **Crop and Live-Stock Statistics.**

The estimated yield of the principal crops of Tasmania in 1911, as compared with 1910, showed a large gain for wheat, turnips, hops, and pears, but a decline in the production of other leading crops. The best crop of the year was grass, for which, however, no statistics are available. The unusual rainfall of the winter and spring spoiled the early crops of oats and wheat in the northern part of the island, but some especially heavy crops of wheat were harvested in the southern part of the State, so that the average for the year much exceeded that of late years. An especially profitable crop was hops, which brought unusually good prices. Tasmania is the chief hop-producing State of the Commonwealth of Australia and is depended upon by leading brewers, especially during recent months when it has been difficult to import hops

on account of shortage in other countries. The output of the chief crops was as follows for 1910 and 1911:

Crops.	1910	1911	Crops.	1910	1911
Wheat.....bushels	703,660	1,120,744	Hops.....pounds	1,160,176	1,775,266
Oats.....do	2,347,584	2,063,303	Apples.....bushels	1,480,107	1,347,932
Barley.....do	135,654	142,318	Pears.....do	94,865	115,954
Potatoes.....tons	73,862	70,090	Hay.....tons	118,746	115,190
Turnips.....do	26,066	48,463			

The estimated number of live stock in 1911 was as follows: Horses, 41,388; horned cattle, 201,854; sheep, including lambs, 1,788,310; pigs, 63,715. All these figures represent gains over the preceding year.

#### The Wool Sales.

At the annual wool sales at Hobart and Launceston early in January of 1911 and 1912 prices were quite remunerative to sheep owners, although not nearly so high as in 1910, which was a record year for prosperity to pastoral interests. At the 1911 sales about 12,000 bales were offered at Hobart and 4,000 bales at Launceston, the quantity showing some slight decrease, although the quality was rather better than usual, especially for merinos. Prices ruled on a level with the mainland market and showed an average decline of about 12 per cent on the previous season. There was good competition, however, for high-class merinos, which nearly all went to the continent of Europe. American competition was weak, as several leading buyers had their orders withdrawn and limits reduced. Several lots of first supermerino realized 32 cents per pound, while the highest price for crossbreds was 27 cents per pound. At the sales early in 1912 the aggregate prices were about 1 cent per pound lower than at the sales in 1911, but as the clip was heavier, containing more grease and dust, the wool appears to have really represented better values than in 1911. Most of the merinos at the recent sales were purchased for the continent of Europe, while the top lots of crossbreds were taken principally for the United States. The merino sheep of Tasmania are especially noted for the firmness and silkiness of their fleece, which is sought by Continental buyers for the manufacture of mercerized silk and superquality underwear; but as this wool also possesses a high percentage of grease, it is not in demand by American buyers, who bid here chiefly for light clean fleeces which will pay the least duty per pound on entering the United States.

#### Output of Minerals.

The mineral production of Tasmania showed another serious shrinkage in 1911, the total figures for the year being \$6,612,322, against \$6,996,763 for 1910, \$7,706,691 for 1909, and \$8,017,847 for 1908. The following statement shows the value of the production of the different kinds of minerals for 1910 and 1911:

Minerals.	1910	1911	Minerals.	1910	1911
Gold.....	\$765,841	\$642,903	Shale.....	\$1,041	\$1,216
Silver-lead ore.....	1,204,828	1,232,981	Wolfram.....	35,428	37,000
Blister copper.....	2,695,174	1,877,481	Bismuth.....	20,677	28,020
Copper and copper ore.....	63,994	111,209	Osmiridium.....	2,579	9,187
Tin ore.....	1,943,646	2,498,947	Total.....	6,996,763	6,612,322
Coal.....	263,555	172,570			

The strike at the copper mine resulted in the decrease in the output of this product. The Zeehan smelters, after being closed for months, resumed operations in July of last year, arrangements having been made with two leading mines for the supply of 80,000 tons of ore during the next two years. The last session of Parliament decided to pay the company owning these smelters a monthly subsidy of \$1,420 during the next two years for every month during which the company shall have smelted or purchased for smelting at least 2,000 tons of ore. The production of silver-lead ore has just about doubled since the reopening of these smelters.

#### **Tin and Gold Deposits.**

The production of tin was greatly favored by increased rainfall, and during the year the price was unusually high, averaging about \$1,000 per ton. The largest individual producer of tin is one mine situated in the northwestern part of the island. During the year some apparently valuable tin deposits were opened up at the X River near the railway line between Burnie and Zeehan. Some Tasmanian capitalists who had been successful with mining properties in their own country lately made important investments in Siam, where the Tongah Harbor Tin Dredging Co. was organized, the majority of the shares being held in Tasmania. This company had a prosperous year and expected to distribute \$185,000 among its shareholders.

The bulk of the gold mined in Tasmania comes from Beaconsfield, on the Tamar River, near Launceston. This is an exceedingly rich mine, but on account of the great cost of pumping out water, some of the largest pumps in the world being used, the net profits in recent years have been small, and last year there was a slight loss, suggesting the possibility that unless the mine can be more economically worked it may have to be closed. A new metal, osmiridium, has lately been discovered and mined in Tasmania, and the output, for which there is a good demand at nearly \$35 per ounce, promises to show much increase in the future.

#### **Development of Resources—Shale Oil Industry.**

The sum of about \$27,500 was recently voted by Parliament for the cutting of tracks, with the object of opening up mineral areas to prospectors. It is anticipated that there may be some development of the iron resources of Tasmania in connection with the cheap water-power development now under way at the Shannon and Ouse Rivers, near the central part of the State.

The shale and oil works near the town of Latrobe, from which much profit had been expected, were closed down during the year, on account of difficulties arising in the treatment of the shale.

#### **Foreign Trade of the Island.**

The total direct over-sea imports into Tasmania in 1911 from foreign countries were valued at \$3,996,053, against \$4,044,893 in 1910, and exports \$3,042,579 and \$2,489,509 for the two years, respectively. The greater part of Tasmania's import trade, however, is carried on through firms and agencies at Melbourne and Sydney, thus credited to the States of Victoria and New South Wales, and therefore the statistics of over-sea trade for this State do not accurately indicate the trend of commerce with foreign countries.

Owing to a recent agreement between the different States of the Commonwealth of Australia and the Commonwealth Government,

whereby in the future the States are to receive from the Commonwealth Government a share of the revenue collected from customs duties on a per capita of population basis, instead of on the basis of the actual duties collected on their imports, it was decided to be no longer necessary to keep any record of interstate transfers of goods from over-sea countries; hence it will be quite impossible in the future to present any reliable returns indicating the foreign trade of any particular State of the Commonwealth, any more than it would be possible to show by customhouse statistics the amount of the imports or exports of any particular State in the United States.

#### American Goods on the Market.

The imports of American goods shipped direct into Tasmanian ports and not purchased or transferred through other States of the Commonwealth amounted to \$364,967 in 1911, against \$403,184 in 1910. This apparent decrease occurred mostly in agricultural implements, reapers, binders and mowers, and manufactured metals, and seems to have been due mostly to bad crop conditions in some grain-producing districts, also to overimportation the previous year, and also because some dealers have found it more convenient to enter such goods through Melbourne and transship them to Launceston for distribution through the northern part of the island, where they are most wanted, than to import direct and to enter them by Tasmanian customhouses. The following table shows the articles imported direct from the United States in 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Apparel.....	\$5,036	\$4,462	Metals, manufactured.....	\$51,784	\$51,400
Arms.....	1,946	2,292	Nails.....	1,333	.....
Agricultural implements.....	29,641	21,252	Pipes, iron.....	1,036	7,830
Ax handles.....	7,494	4,418	Plated ware.....	3,017	3,134
Books, printed.....	2,321	1,751	Paints.....	8,625	7,221
Boots.....	1,800	1,309	Paper manufactures.....	17,986	10,910
Cartridges.....	3,971	2,627	Paperhangings.....	2,788	1,445
Clocks.....	3,145	4,710	Perfumery.....	1,231	1,610
Cream separators.....	6,049	6,306	Place goods.....	5,148	10,059
Electric materials.....	2,513	4,501	Reapers, binders, mowers.....	22,478	6,678
Engines.....	5,100	7,270	Stationery.....	1,518	1,800
Fancy goods.....	3,450	1,713	Tools, hand and machine.....	16,307	24,514
Fish, preserved.....	9,226	11,227	Timber.....	10,650	2,652
Furniture.....	4,034	5,182	Tobacco.....	42,480	25,943
Galvanised iron.....	4,156	3,786	Varnishes.....	1,280	.....
Glassware.....	1,761	1,468	Vehicles and parts.....	19,962	34,956
India-rubber goods.....	3,129	5,508	Wire.....	6,073	11,723
Instruments, musical.....	2,627	861	All other articles.....	57,861	64,195
Lamp ware.....	1,503	2,277			
Machinery.....	28,963	33,320	Total.....	403,184	364,967
Medicines.....	3,932	3,286			

The above figures are of value as indicating the kind of goods required from the United States for consumption in Tasmania, but the amounts doubtless fall far short of showing the actual quantity and value of goods imported from the United States, owing to the large trade carried on through Melbourne and Sydney. This is especially true now that Tasmanian importers are no longer impelled by the desire to have imports entered at local customhouses and thus credited to the revenues of their own State, and so will now most likely enter them at customhouses in the first ports of arrival in Australia.

#### American Motor Cars—Market for Electrical Goods.

The most significant recent gain in imports from the United States has been in motor cars, of the moderately priced kind, the use of

which in Tasmania is showing rapid increase. American motor cars have captured the Tasmanian market and have become popular with commercial travelers, doctors, station owners, etc., enabling, as they do, a quick means of transport over long distances of thinly settled country, where railroad facilities are either entirely absent or afford only slow and infrequent means of communication. There is now a daily service of American motor cars carrying passengers between the two chief towns of Tasmania—Hobart and Launceston—120 miles apart, in successful competition with the Government railway.

By the 1st of January of next year, Hobart and small near-by towns will be supplied with cheap electric current for lighting and power purposes derived from the water-power resources, and this ought to stimulate a demand for electrical materials and apparatus, of which American manufacturers might take advantage. The city of Launceston, which now has a limited supply of cheap electric power, will doubtless have larger supplies available in the near future, and it seems only a matter of time when probably most of the towns of Tasmania will be electrically developed. The estimated cost of providing the electricity contemplated and of erecting some metallurgical works in connection therewith is \$1,200,000. The company expects later on to use the electric power not only for the treatment of complex Australian ores, but also for the manufacture of calcium carbide, calcium cyanide, etc.

#### **Establishing American Agencies—Exports to United States.**

This consulate receives many letters from American manufacturers asking for lists of desirable agents to represent their particular lines of goods. Unfortunately, nearly all of the leading firms of this island are already committed to agencies for any lines they care to handle, so it is becoming difficult for American manufacturers who desire to enter this field with their goods to find suitable agents, and increased inducements to secure agents may only tend to unsettle the loyalty of such firms to American manufacturers for whom they may be already acting as agents. It is suggested, therefore, that American manufacturers who may not be able to find from the lists supplied from this consulate, or in the World Trade Directory, firms in a position to represent them might send a representative here, possibly in cooperation with other American firms, for the establishment of selling agencies in this and other States in the Commonwealth.

The value of the articles invoiced through the American consulate at Hobart to the United States was about double that of 1910, and about three times the value of the 1909 shipments. This increase was due principally to the direct trade in timber, known locally as stringy bark, and shipped to California for use mostly for railway ties. Local timber merchants are hopeful of an important growth in these exports. The total exports to the United States last year were valued at \$170,438, made up as follows: Timber, \$95,008; apples, \$56,713; wool, \$17,737; and shell necklaces, \$980. There was \$3,009 worth of jam shipped to Hawaii, against \$2,169 worth in 1910.

#### **Need of Shipping Facilities with United States.**

It is anticipated that after the opening of the Panama Canal there may be better steamship service with the eastern coast of the United States, that Tasmanian wool, apples, and timber may be shipped direct, and that the vessels return with American produce. At

present all Tasmanian wool reaches the United States via England, and the returning ships bring back mostly English goods. One of the greatest difficulties of trade at present between the United States and Australia is that the Eastern States of the United States, which manufacture most of the goods desired for this market, and also might afford the best market for the products of this part of the world, have such infrequent means of ocean communication with Australia, thus preventing much business in goods for which the demand varies according to fashions and seasons. At one time it was possible for importers here to secure advantageous through rates from manufacturing points in the Eastern States by rail to the Pacific coast, and thence by steamer across the Pacific Ocean, but since the withdrawal of the through rates such business has decreased considerably, and now most goods from the United States for this market have to be shipped by the Atlantic Ocean and Cape of Good Hope route.

There have been no American ships at the port of Hobart for over a decade. The number of vessels arriving at Hobart during 1911 was 351, of 1,321,010 tons. The number of French ships calling here for orders was 21, of which 16 obtained bills of health at this consulate on account of intended destination in the United States. These French ships usually arrive at Hobart in ballast and receive cable orders to depart for other ports. They are paid bounties by the French Government proportionate to the mileage of their sailing routes. With the exception of the French ships mentioned, nearly all of the ships arriving here in 1911 were British or Australian, with a few Norwegian and German vessels.

#### Harbor and Other Improvements—Railway Construction.

The Marine Board of Hobart is spending about \$350,000 on additional improvements to the Hobart harbor, so that it will be possible for the largest ships afloat to load their full complement alongside the wharves, thus anticipating considerable expansion of trade. The continued prosperity and growth of Hobart has induced the city government to initiate many improvements. In addition to a new reservoir, up-to-date abattoirs costing \$150,000 have been erected, while the loan of \$100,000 for laying pavements in the main streets has been authorized. A system of underground sewerage for the city will be completed by June next. At Launceston, the second city of Tasmania, a tramway system was completed last year, which is shortly to be extended.

Two short railways were authorized by the last session of the Tasmanian Parliament. The total railway mileage of the State is at present about 664 miles, including the Government-owned line between Hobart and Launceston, also Government lines paralleling the north coast and several private lines in the mining country of the west coast.

#### Population—Tourist Traffic.

According to the 1911 census, the population of Tasmania was 192,410, or 7.39 to the square mile. The average population to the square mile for the whole of the Commonwealth of Australia was 1.49. The Tasmanian summers are much cooler than those of Australia, and therefore the island is visited by thousands of tourists from the mainland cities, who contribute largely to the island's prosperity. There are not over a dozen Americans in Tasmania known to the consulate, and these are doctors and dentists and a mine manager.

**GERMAN INDUSTRIAL NOTES.**

[From Consul Milo A. Jewett, Kehl, Baden.]

**New Potash Deposits Discovered.**

After numerous unsuccessful attempts to find potash (kali) in Baden, a boring was made in April near Mullheim, Baden, which disclosed a potash deposit 13 feet thick at a depth of 2,322 feet. This research work was conceded by the Ministry of Finance of the Grand Duchy of Baden to Dr. Eltzbacher, of Berlin, about 18 months ago. Further research work is being carried on in the same region.

A new shaft is being constructed at the potash mine in Ballweiler, Alsace. It is near the Rudolf I mine, and will be known as Rudolf II.

It appears probable that Mulhausen, in Alsace, will be made the fourth distributing center for potash, although Strassburg is strongly urging its claims for this important trade.

**New Mills in Alsace—Sewers—Aviation and Shipping.**

Dollfus-Mieg & Co. will build a new spinning mill at Dornach, near Mulhausen. It will be about 660 by 165 feet, and will employ 1,500 operatives.

The Dietrich Co. has built a new \$500,000 sawmill at Niederbronn, Alsace; daily capacity, 2,800 cubic feet of finished lumber.

Strassburg will spend \$350,000 on improving the city sewerage system.

An extensive aerodrome, with garages for flying machines, Zeppelin and other airships, is nearly completed at Strassburg. Important races were arranged for May 10 and 11.

A new shipping company has been formed in Holland for a direct freight service between Amsterdam and Strassburg. The company has 26 steamers of 750 to 800 tons each, which will touch at the principal Rhine harbors.

**Improved Electric Bell System, Vacuum Street Cleaner, and Storage Tank.**

A recent invention adopted by the Strassburg Electrical Co. is an electric transformer by which electric-light current will operate the ordinary electric call bells, substituting stationary batteries in each house.

A vacuum cleaner has been adopted to clean the tracks of the Strassburg street railways. It resembles a box car and in addition to the ordinary drive motor has an electric motor which operates a vacuum cleaner within the car. The dirt on the track is sprayed with water, scratched and drawn up into the closed car by the suction apparatus. Twenty-five miles of roadbed are thus effectively cleaned daily by a vacuum cleaner operated by one man, which does the work of 17 men working in the ordinary way.

A new storage tank for benzine and other explosive liquids is being adopted in this region. It allows no air in contact with the benzine, and consequently no explosive gases are generated. The empty space of the tank is filled with carbonic-acid gas and the benzine is forced from the closed tank by a pump which forces carbonic-acid gas into the tank.

The English worsted firm referred to in Daily Consular and Trade Reports for May 24 as moving from Cleckheaton to Doncaster is simply moving its Bradford branch thereto. Consul Ingram now advises that the principal works are at Cleckheaton.

**COTTON GOODS IN ARGENTINA.**

[From Consul General Richard M. Bartleman, Buenos Aires.]

For the use of the American textile industry, I have obtained a collection of samples representing the more important varieties of textiles imported into Argentina. If the sale of American textiles in this country is small, it is largely the fault of the American merchants and manufacturers, since I am informed that American goods are scarcely known here. They should be properly introduced by commercial travelers prepared to fall in with the wishes of customers, and the travelers should bring with them only the finest and most up-to-date samples. Large sales can be made, I am convinced, if Americans would open up their own houses and sell direct to retailers. In this way they can break into the market as Germany, Italy, and others have done.

Goods are brought here in three different ways: First, leading importers who have their purchasing houses abroad buy direct from the manufacturers, their credit being according to their rating. These importers receive the original invoice. Second, importers may buy through commission houses abroad. They do not receive the original invoice, but get a credit of six months or more. Third, representatives of manufacturers sell goods on a commission basis.

**Imports of Textiles Increasing.**

Argentina's imports of textile manufactures during the last four years have been as follows:

Articles.	1908	1909	1910	1911
Cotton.....	\$27,119,134	\$32,579,836	\$37,375,080	\$34,331,367
Wool.....	8,980,084	10,806,453	12,904,074	13,750,514
Silk.....	4,009,282	5,046,110	5,429,184	5,680,027
Jute, linen, etc.....	8,045,720	9,394,271	10,174,036	13,516,752
Total.....	48,164,170	57,826,360	65,972,384	67,258,660

Manufacturers and merchants interested in Argentina's textile trade should read Commercial Agent W. A. Graham Clark's report on this subject, to which I can add nothing. Since Argentina offers the best market in the southern republics for all classes of textiles, the trade is well worth working for.

The 117 samples forwarded by Consul General Bartleman have been sent by the Bureau of Manufactures to the office of the National Association of Manufacturers, 30 Church street, New York City, where they may be examined by those interested. Later they will be sent to other textile centers. Copies of the report by Commercial Agent W. A. Graham Clark, referred to by Consul General Bartleman, may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 5 cents each.

**New Handbook of Argentina.**

"The Argentine in the Twentieth Century" is a new publication in London which comprises chapters on the various industrial, commercial, and economic features of the country's development. It was written by Albert B. Martinez, undersecretary of state, and Maurice Lewandowski. A copy has been added to the public reference files of the Bureau of Manufactures at Washington.

**INTENSIVE FARMING IN SPAIN.**

[From Consul Robert Fraser, Jr., Valencia.]

The Province of Valencia has an area of 4,150 square miles and a population of 856,188 persons, of which the city of Valencia contains 231,070. The region is almost wholly agricultural, and that part which forms the great plain between the mountains and the Mediterranean is famous as being probably the best and most intensively cultivated region in all Europe. The richness of the soil, benignity of the climate, and skill in irrigation and cultivation, handed down from father to son with but slight modification for four centuries, are the principal factors contributing to this result.

The system of irrigation, so necessary in view of the annual rainfall of only some 17 inches, is especially interesting. The parts of the region which it is not possible to irrigate are so arid as to produce little, whereas the lands of the plain bordering the sea produce such heavy crops as to be extremely valuable. They are officially estimated as being worth an average of \$656 per acre, and are so intensively cultivated that there are cases of official record of 100 acres supporting 160 families, and of single families which live on the product of four-tenths of an acre. In one village of the region farmers are renting land to put under irrigation by pump water at the rate of \$29.50 per acre per annum and paying extra for the water at the rate of 45 cents per hour for a stream giving 200 gallons per minute.

In contrast to these values, wages are low, uniformly averaging 36 to 54 cents per day (without food or lodging) for men and 18 to 27 cents for women. One result of this combination is that it is found cheaper to do almost everything by hand rather than use agricultural machinery; and another, that an amount of minute care and personal attention is given to crops and individual plants impossible under other circumstances. The average production of the most important crops of the Province, given in metric tons of 2,204 pounds, is as follows: Oranges, 400,000; olives, 65,000; carob beans, 72,000; peanuts, 13,500; melons, 36,000; grapes, 87,000; peppers, 12,000; tomatoes, 27,000; wheat, 62,000; barley, 18,000; corn, 38,000; rice, 200,000.

[Irrigation as practiced in Valencia and other parts of Spain was described in Daily Consular and Trade Reports for Jan. 23, 1912, May 26, 1911, Oct. 4, 1910, June 8, 1908, Sept. 19 and Apr. 19, 1907.]

**GOLD EXPLOITATION IN VENEZUELA.**

[From Consul Herbert R. Wright, Puerto Cabello; supplementing report from Ciudad Bolivar in Daily Consular and Trade Reports for May 25.]

On April 20 two Spanish subjects, Eusebio Rodriguez and Esteban Sivisa, were granted permission by the authorities of Puerto Cabello to exploit a gold field, which, according to a document filed with the public registrar, they have discovered in Borburata, a small village in the suburbs of Puerto Cabello. They claim that the gold field is 200 hectares (494.2 acres) in extent and has much gold quartz, which also contains other metals.

Consul A. E. Ingram notes that a feature of the April shipments (\$728,194 worth) of English wool from Bradford to the United States was that nearly a fifth consisted of skin or pulled wools. April, 1911, shipments were only \$271,132.

**ACTIVITIES IN ONTARIAN LAKE CITY.**

[From Consul Felix S. S. Johnson, Kingston, Canada.]

Kingston manufactories are, without exception, flourishing. The people having voted concessions to the Canadian Locomotive & Engine Co., it is spending \$500,000 on improvements, and by the end of this year will increase its monthly output from 7 to 15 locomotives and from 600 to 1,000 employees. The Kingston Shipbuilding Co. is adding new machinery. The Wormith Piano Co. has just increased its acreage, trackage, kilns, etc., at a cost of \$10,000. The Davis tannery has increased its capacity, and the volume of business for 1912 is expected to exceed 1911 by \$100,000. The many other industries here are also thriving. The North American Smelting Co.'s plant is to commence operations by June 1, while the Buffalo-Ontario Smelting Co. will be working in a few months with 50 men. The Kingston Brick & Tile Co. has begun with a daily output of 40,000 to 60,000 bricks.

Construction of dwellings, etc., is also active, the building permits for January 1 to April 30 aggregating \$114,949, an increase of \$57,082 over the first four months of 1911. The new hotel company is now prepared to commence erecting its building. The Grand Trunk Railroad is about to erect freight terminals here, having secured water-front rights from the Kingston & Pembroke Railway. Work has also started on the new Welland Canal; with the opening of this canal comes the necessity for harbor accommodations at the foot of the Lakes. The first step for Kingston's greater harbor has been taken (as shown in the report from this consulate in the Daily for May 28).

Kingston is also growing as a trade center. Exports to the United States for the first four months of this year aggregated \$175,027, an increase of \$111,710 over the same period in 1911. Customs receipts of the port for the year ended March 31, 1912, were \$250,215, an increase of \$55,307 over the previous year.

The educational advantages have also widened. Gordon Hall (Queens University) has been completed and opened for students, while the Nicol Building will be opened for next session. Contracts have been awarded for dormitories and for other important additions at the Royal Military College, and when the plans are completed the capacity of the college will be doubled.

---

**WINTER PORT TRADE OF ST. JOHN.**

[From Consul Henry S. Culver, St. John, New Brunswick, Canada: supplementing report published May 16, 1912.]

The complete figures for the winter port export trade (1911-12 season) at this port are a most encouraging commentary on the development of St. John. There were 120 sailings, and the exports amounted to \$33,460,460, an increase over the 1910-11 season of \$7,991,428. Of this total, \$17,837,772 represented Canadian goods, \$12,142,688 foreign goods (principally products of the United States), and \$3,480,000 Canadian furs and silver. Of the above exports, \$1,416,232 worth was shipped direct to South Africa, \$1,056,542 to Australia and New Zealand, \$408,609 to Hamburg and Rotterdam, and the balance to Great Britain. The shipments of grain amounted to \$7,967,766.

Of the imports of merchandise, 453 cars were sealed for transportation to the United States.

**RUSSIAN COMMERCIAL VISITORS TO TURKEY.**

[From Consul General George Horton, Smyrna.]

That Russian business men consider Levant markets worth while is shown by the persistent efforts which they are making to obtain an outlet for their products here. These efforts receive the full support of the Russian Government. The Russian exposition ship, which was sent out in 1910 to the different ports of the Black Sea and the Levant, was an unqualified success from every point of view. This has been followed up by a tour of the principal cities of the Levant by a body of Russian business men and officials.

These gentlemen arrived in Smyrna the first week in April. They met with a cordial reception from the Turkish officials as well as from local business organizations. Commercial relations were discussed, and the fact was brought out that Russian products are gaining ground in this region. It was asserted that as a result of the floating exposition, mentioned above, Russian articles hitherto unknown in the Smyrna district had been introduced here and new business connections formed. The only statistics quoted were those of the Ottoman Chamber of Commerce for 1908, according to which the general trade between Russia and Smyrna amounts to \$1,666,000, exports forming \$423,000 and imports \$1,243,000 of this total.

[Among the numerous references to the Russian floating exposition that appeared in Daily Consular and Trade Reports were the articles published on Jan. 27, Mar. 12, Apr. 9, May 21, and Aug. 30, 1910.]

**CHILEAN TRADE AND INDUSTRIAL NOTES.**

[From Consul Alfred A. Winslow, Valparaiso.]

*Coal* has been discovered north of Santiago in the Cordillera in the Province of Aconcagua.

*Customs receipts* during the first quarter of 1912 were \$12,689,945, against \$11,424,135 for the same time in 1911.

*The Arica to La Paz Railway* is to be officially opened on August 6, 1912. This will give Bolivia three railroads to the Pacific coast.

*Nitrate export taxes* for 1911 aggregated \$30,154,110, against \$18,823,780 received by the Chilean Government for import duties during the same time.

*The iodine combine* that regulates the production of iodine in Chile, and thus fixes the price, has completed arrangements to continue still another three years.

*The Government Railways* (1,657 miles) were operated during 1911 at a total cost of \$12,748,891, with total receipts of \$10,548,795 from 10,836,605 passengers and 4,489,205 tons of freight.

*A new fog signal* is to be built at Tumbes Point, near Talchuan, Chile, the contract for which has been let to Benedetti & Bracchiglino. The old fog horn was destroyed by landslides last year.

*Tobacco*.—A syndicate has been formed in London, England, to develop the tobacco industry in Chile, where excellent tobacco is grown. The idea is to develop all the manufacturing departments of the business.

**PROPOSALS FOR GOVERNMENT SUPPLIES.**

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

**No. 658. Navy Department supplies.**—The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., will receive bids until June 11, 1912, for the following supplies. Firms interested therein should make application to the Bureau of Supplies and Accounts, giving the schedule numbers desired: Schedule 4580, boring and turning lathe. Tenders are invited until June 18 for the following: Schedule 4584, cast-steel Navy type anchors, candles, air hose, rubber fire hose, suction hose, rawhide lacing leather, ships' fishing seines, flax twine in skeins, files, cast-bronze hinges, coat and hat hooks, brass escutcheon pins, galvanized-iron paint pots, galvanized cast-steel crucible wire, sheet tin; schedule 4592, leather belting; schedule 4582, pipe bender; schedule 4595, rubber boots, oiled clothing, oiled long black coats; schedule 4588, carbons for arc lights, fireroom clocks, steam gauges, metallic flexible hose, packing leathers, seamless drawn copper and brass pipe, composition gate valves, single conductor wire, brass bolts and nuts, composition stud bolts, steel bolts and nuts, round bar brass, round naval rolled brass; schedule 4590, rubber insulated lead sheathed cable, mesh fencing; schedule 4593, Portland cement; schedule 4591, magnesia pipe covering; schedule 4587, iron-pipe fittings, galvanized-iron pipe, manganese-bronze forgings, torpedo bronze forgings, mild-steel forgings; schedule 4589, gravel, concentrated lye, building sand, fresh-water laundry soap, salt-water soap; schedule 4581, motor drive tool converting machines; schedule 4586, fish and rail plates, angle bar steel; schedule 4597, stationery, thimbles; schedule 4586, point switches; schedule 4583, white ash, hackmatack knees, white oak, white pine; schedule 4596, alcohol; schedule 4583, muriatic acid, metallic brown in oil, paint drier, chrome green in oil, red dry lead, raw linseed oil, aluminum paint, gum orange shellac, petroleum spirits, artificial dry vermilion, white dry zinc, white zinc in oil. Bids will be received until August 27 for furnishing dark-blue cloth for trousers, jackets, and caps, schedule 4594.

**No. 659. Sale of vessels.**—Sealed proposals will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until June 10, 1912, for the purchase of the following vessels: Atlanta, at navy yard, Charleston, S. C., appraised value \$10,500; Alvarado, at Morgan City, La., appraised value \$800; Santee, at Naval Academy, Annapolis, Md., appraised value \$12,000; Yankee, aground at entrance of Buzzards Bay, New Bedford, Mass., Yosemite, at navy yard, Norfolk, Va., appraised value \$25,000. Forms of proposals and bond and information concerning the vessels and the terms and conditions of sale may be obtained upon application to the Bureau of Supplies and Accounts.

**No. 660. Dummy armament, fire-control apparatus, and accessories.**—Sealed proposals for the installation of dummy armament, fire-control stations, and accessories in the armory of the Thirteenth Coast Artillery district, New York, and the Ninth Coast Artillery district, New York, will be received at the United States Engineer Office, Room 707, Army Building, New York, N. Y., until June 1 and 3, respectively. Information on application to S. W. Roessler, Colonel, Engineers.

**No. 661. Panama Canal supplies.**—Sealed proposals, in triplicate, will be received at the office of the General Purchasing Officer of the Isthmian Canal Commission, Washington, D. C., until June 10, 1912, for furnishing the following supplies: Structural steel, rivets, wrought pipe, cast-iron pipe, sheet lead, chinaware, glassware, mess-kit cups, dish pans, bakers' sheets, teaspoons, flesh forks, and waiters' towels. (Circular No. 712.)

**No. 662. Interior marblework.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until June 19, 1912, for the interior marblework (except in toilet rooms) for the United States post office at Minneapolis, Minn. Drawings and specifications may be had from the superintendent of construction at the building, or at the office of the Supervising Architect.

**No. 663. Heating and ventilating apparatus.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until June 21, 1912, for the installation of a heating and ventilating apparatus, etc., for the United States post-office and courthouse building at Charleston, W. Va. Drawings and specifications may be had at the office of the superintendent of construction at Charleston or of the Supervising Architect.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8891. Wharf construction.**—The American consul general at Ottawa, Canada; reports that the Department of Public Works has advertised for tenders for constructing a wharf at Fredericton, New Brunswick, and a pile wharf at Edmonton, Alberta. Bids for the former will be received until June 6, and plans, specifications, and form of tender can be obtained for both undertakings at the Department of Public Works, Ottawa, Canada. Tenders for the wharf at Edmonton will be received until June 17, 1912.
- No. 8892. Timber concessions.**—An American consular officer in Russia has forwarded copies of letters received from a resident of that country in regard to a timber proposition in which he wishes to interest American capitalists. Copies of the correspondence, containing further details, will be sent to firms applying to the Bureau of Manufactures.
- No. 8893. Heating apparatus.**—A report from an American consul in Africa states that a firm in his district engaged in tendering for large heating contracts is desirous of receiving from American manufacturers of heating apparatus catalogues, price lists, and full information concerning radiators, boilers, and heating apparatus of all descriptions for steam, hot and warm water heating. Cable addresses and codes should be included in the information furnished. Up to the present materials for heating systems have been purchased principally in England, and this is an opportunity for American manufacturers to secure at least a share of this trade if they are prepared to quote satisfactorily on the business. It is strongly urged that manufacturers responding to the request of this firm should send duplicates of their catalogues and other information to the consulate for use in answering future inquiries of a similar nature.
- No. 8894. Road machinery and iron bridges.**—Supplementing a previous report on road construction in a Latin-American country an American consul reports that in addition to the road machinery already purchased the Government will probably need more traction engines, rock crushers, cars, etc. These will be ordered early next year. About 13 bridges from 27 to 105 feet long must be built. No provision is made for the material to be used in constructing these bridges, but the consulate was requested to obtain catalogues and price lists showing iron bridges. Communications should be addressed in Spanish to the inquirer, and it would be well also to send catalogues and price lists to another person whose name is furnished.
- No. 8895. Benzine.**—A business firm in a foreign country has written an American consulate that it desires to receive regularly large shipments of American benzine direct, and it would like to get in touch with firms in a position to furnish such requirements. The firm desires to receive this article as cheaply as possible, without the necessity of paying duty in two different countries.
- No. 8896. Moving-picture films.**—An American consul in Russia reports that a business man in his district desires to obtain the sole agency, covering the territory of Siberia and Northern Manchuria, for American moving-picture films. His idea is to introduce the films by means of establishing a film exchange, and with that end in view would be pleased to receive catalogues and enter into correspondence with American manufacturers of this article as to terms and conditions.
- No. 8897. Collapsible lifeboats.**—A report from an American consular officer in a European country states that a firm in his district desires to be placed in communication with American manufacturers of collapsible lifeboats. Owing to recent marine disasters there will probably be a considerable demand for boats of this class in the country in question. The inquirer is prepared to purchase or act as representative. Satisfactory references can be furnished. Correspondence in English, French, or Italian. Catalogues, prices, discounts, and terms are desired.

*Scientific apparatus* makers in England are rapidly extending their foreign trade this year, the aggregate January 1 to April 30 reaching \$2,517,000, against \$2,200,000 and \$1,256,000 in the same periods of 1911 and 1910.

**NOTES FROM MALAYSIA.**

[By Vice Consul General D. Milton Figart, Singapore.]

**Textbook on Spices.**

A new book on spices by Dr. H. N. Ridley, late director of the Botanic Gardens, Singapore, which sells for \$3 gold, is a practical work for planters and treats of soils suited for the various spices, the diseases from which the plants suffer, etc.

**Singapore Water Supply.**

On March 26, 1912, the new Kallang Reservoir and the Woodleigh filters supplying water for Singapore were opened by the Governor of the Straits Settlements. The total area contributed to the new reservoir is 3,007 acres. The top water area is 253 acres, the maximum depth 27 feet, the total capacity 845,000,000 gallons, and the available storage 211 days' supply when delivering at the rate of 3,500,000 gallons per day, which, taken in connection with the Thomson Road Reservoir, makes a total supply for Singapore of 9,000,000 gallons per day in the driest season.

The filters are slow sand filters, 9 in number, with an area of nearly 7 acres and capable of dealing with 4,000,000 gallons of water per day. After filtration the water is stored in the clear-water tank, which is divided into two portions to facilitate cleansing and has a total capacity of 4,000,000 gallons. The Singapore water supply as augmented by the new works is still considered insufficient for coming years and discussions have already been instituted regarding additional supplies.

**Copra Drying.**

An idea has been submitted by Mr. Hamel Smith for drying copra by the acre and is receiving considerable discussion in tropical papers. A building with 4 floors about 100 by 30 feet, with an 8-foot shaft is suggested. The skeleton floors are covered with a woven wire fastened to the joists, and in order to prevent rust contamination loosely woven sacking or matting is to be laid over the wire netting. Mr. Smith claims that based on actual results such a building is estimated to be capable of drying 48,000 pounds of copra in 10 hours. The heaters, which will burn husks or other refuse as fuel, heat part or all of the air blown through the airways by 4 propeller fans, and a valve is provided for admitting normal air direct into the building in order to control the temperature.

**International Rubber Exposition.**

It has been decided that the Federated Malay States shall be officially represented at the International Rubber Exposition to be held at New York September 23 to October 3, 1912, and arrangements have been made to secure suitable space for exhibits in the exhibition buildings. The section will be under the charge of Mr. Leonard Wray, I. S. O., late director of museums, Federated Malay States. No export duty will be charged on approved exhibits. The whole cost of the section will be guaranteed by the Governments of the Federated Malay States and Straits Settlements, but it is hoped that contributions will also be received from associations.

## HONGKONG'S COMMERCIAL YEAR.

[By Consul General George E. Anderson.]

The 1911 trade year in South China had peculiarly mixed results. Its close found commercial circles surrounded with revolution and complaining of depression and stagnation. Practically all local comments upon the year's trade in Hongkong were unfavorable. Nevertheless, both in imports and exports the record of 1910 was equaled and in most cases exceeded, while in few lines was there any greater stagnation than in the previous season.

The general opinion in commercial circles seems to be that while the volume of business was as large or larger than in 1910 it was done at a smaller profit; and in several commodities the year's trading resulted in immense losses.

Exporters of tin, silk, rice, and various other lines after buying a considerable stock were forced to sell at a loss, partly because of a collapse in their special lines and partly because of the revolution's interference with the movement of supplies. Similar losses and small profits seem to have been characteristic of the trade of all China and the Far East.

### Causes of Losses in Trade.

Native competition with foreign firms, increasing production of standard goods for export, and increasing direct connections between middlemen and manufacturers have been reducing the margin of profits in trade for a number of years and the business of the country is gradually getting on a new basis.

Political conditions in South China restricted the importing powers of the people and interfered with production and movement of goods to seaboard. An incipient revolution in Kwangtung Province in the spring led to disorder in many of the southern districts, caused nearly 100,000 people to leave their homes and congregate in Hongkong and other ports, even as far north as Shanghai, and led to money hoarding, credit restriction, and general trade disturbance.

Uncertainties of the situation were such that in some respects the actual outbreak of the revolution in October was a relief to business men, as there was a feeling that it was the beginning of the end of

trouble in South China and that whatever the outcome it was bound to be better than conditions which had existed for years. It is significant that the worst quarter of the year as regards Hongkong-American trade was the third, before the revolution came.

#### **The Financial Situation.**

The outbreak of the revolution in the autumn resulted in an increased demand for silver and rising exchange checked exports materially, though the condition of the country prevented a corresponding increase in imports. The course of exchange during the year was, on the whole, quite favorable as it remained fairly steady during the first nine months at 42.25 to 43.2 cents gold to the Hongkong dollar, based on London exchange. The lowest rate was 42.125 and the highest 44.75. In October, practically coincident with the beginning of the revolution, commenced a steady rise in silver and exchange. Since the beginning of 1912 rates have gone higher than for years, telegraphic transfers just before the Chinese New Year being quoted at 2s. on London or 48½ cents on the United States. On the whole, however, the revolution has produced much less disturbance financially than might have been expected. The worst effect commercially has been that foreign middlemen were forced to withdraw credit from Chinese buyers, and this restricted business more than any other single element.

Banks, as a rule, paid their usual dividends, though with more difficulty than usual. Transactions in stocks were on a smaller scale, during the latter half of the year particularly, and shares ranged much lower in price than for several years past, though this was due largely to the rubber-share speculation along the China coast during 1910.

#### **Trade with the United States.**

The total trade of Hongkong with the United States in 1911 increased immensely over that of 1910 and all previous recent years, due to the extraordinary imports. Hongkong's exports to the United States, including Hawaii, showed but a slight decrease compared with 1910 and were in excess of those of 1909.

The balance of trade was in favor of the United States by about \$4,500,000 gold. American exports amounted to about \$8,500,000 gold and Hongkong's exports to the United States to substantially \$4,000,000 gold. However, Canton's exports to the United States, aggregating about \$7,000,000 gold, with substantially no imports except through Hongkong, made the net balance of trade in this part of China about \$2,500,000 against the United States, as compared with a balance against the United States of perhaps \$5,000,000 in 1910.

There was a heavy movement of money from Chinese and others in the United States to correspondents in and near Hongkong. Local bankers estimated the total valuation of drafts sent from the United States at \$100,000,000 silver or about \$42,500,000 gold. This sum covers the balance of trade and also the savings of Chinese in the United States, including remittances for speculation in silver exchange. Most of these drafts were covered by shipments of silver from North America and by drafts to cover purchases of silver in India through London.

#### **Imports from the United States.**

The imports from the United States accounted for the chief increases in the import trade of Hongkong in 1911. American flour at present dominates the market completely, and American oil made up more than half of the total amount imported. The trade of this part of

China in oil at present has settled down to competition between dominant American oil interests and the producers in the Dutch East Indies.

American cotton goods sold in Hongkong in 1911 amounted to more than twice those of 1910, although the total value of the trade does not yet exceed \$100,000. Most of the American goods are still in warehouses because of the unfavorable state of the trade generally. In cotton yarns American manufacturers could reach only the knitting-yarn trade, but in that line they dominate the market.

While the material increase in American imports consisted almost entirely of flour and kerosene, the trade as a whole is more satisfactory than at the close of 1910; more American manufacturers and exporters are represented by agents, and their representation has improved. American exporters are displaying more interest in this market and their goods are in better estimation and repute.

#### Exports to the United States.

Although the exports to the United States and Hawaii decreased by about 2.3 per cent, there was an actual gain during the last half of the year when the disorder might have explained a less favorable record. There are few items in the exports to the United States which show decreases over similar items in 1910, the declared exports, according to consular invoices, being as follows:

Articles.	1910	1911 <sup>1</sup>	Articles.	1910	1911 <sup>1</sup>
Aniseed.....		\$13,043	Provisions.....	\$619,570	\$510,639
Aniseed oil.....	\$60,095	71,076	Rattan and manufactures....	80,328	58,497
Bristles.....	24,162	46,520	Rice.....	561,853	617,393
Cassia.....	244,042	213,891	Shoes (Chinese).....	58,188	50,428
Cassia oil.....		64,954	Silk piece goods.....	57,234	100,894
Cement.....	0,647		Silk (raw).....	548	
Clothing.....	42,520	38,464	Sugar (refined).....	29,091	37,749
Earthenware and glassware...	44,307	66,019	Soya.....	63,069	42,135
Fireworks.....	26,988	16,494	Tea.....	117,589	108,489
Flour.....	907	868	Tin slabs.....		798,941
Human hair.....	695,137	292,758	Tobacco.....	50,279	51,003

Medicine (Chinese).....	82,553	72,873	Wood and manufactures.....	19,780	26,044
Paper and manufactures.....	35,570	27,210	All other articles.....	267,810	241,114
Peanuts.....		23,088			
Peanut oil.....	228,296	300,866	Total.....	4,434,639	4,047,251

<sup>1</sup> Continental United States only.

The large decrease in the figures for exports of metal and manufactures during 1911 is due to the fact that tin is given separately, while it was included under metals and manufactures in 1910.

The total exports from Hongkong to all American territory during 1911, including \$5,509,792 to the Philippines, amounted to \$9,839,188, as compared with \$9,348,853 in 1910 and \$8,344,885 in 1909.

The exports to Hawaii in detail during 1911 were as follows:

Articles.	Value.	Articles.	Value.
Clothing.....	\$1,228	Shoes (Chinese).....	\$5,935
Earthenware and glassware.....	7,781	Silk piece goods.....	4,037
Fireworks.....	9,697	Sugar, refined.....	16
Flour.....	44	Soya.....	1,238
Metal and manufactures.....	2,994	Tea.....	14,934
Medicine (Chinese).....	13,165	Tobacco.....	6,754
Paper and manufactures.....	4,914	Wine (Chinese).....	30,560
Peanuts.....	303	Wood and manufactures.....	1,746
Peanut oil.....	21,770	All other articles.....	18,620
Provisions.....	130,415		
Rattan and manufactures.....	732	Total.....	282,145
Rice.....	5,189		

**Trade with the Philippines.**

The trade with the Philippines reflects the constantly improving conditions there. Imports from the Philippines were less than in former years for the reason that a large share of the trade which formerly went through Hongkong now goes direct. There was also a decrease in imports of Philippine sugar, since the United States now takes nearly all of the Philippine output.

Hongkong exports to the archipelago, however, show constant increases from year to year, the record of 1911 being the best in the history of the trade. As the value of Philippine exports to Hongkong during 1911 probably did not exceed \$1,000,000 gold at the outside, the balance of trade against the Philippines was at least \$4,500,000, covered largely by heavy remittances from the United States.

Imports of Philippine goods for local use, notably native products like hats, embroideries, fruits, and the like, are considerably on the increase, and there is a strong movement to start a special store for the sale of these products. But the export trade of products for further distribution, such as sugar, hemp, copra, etc., is rapidly disappearing. Philippine figures show that imports into Hongkong for the fiscal year 1911 amounted to only \$874,700, as compared with \$1,458,420 in 1910, \$2,271,016 in 1909, \$2,438,438 in 1908, and \$2,551,902 in 1907. The change is the direct result of the Payne Tariff Act and the increase in Philippine exports of sugar, tobacco, copra, and other products to the United States as compared with its exports to other countries. In spite of this decrease the actual commercial relations of the two colonies are much closer than they have ever been.

**Exports to the Philippines.**

Exports to the archipelago increased, particularly in standard goods. The declared exports for 1910 and 1911 from Hongkong to the Philippines were as follows:

Articles.	1910	1911	Articles.	1910	1911
Aniseed.....		\$198	Provisions.....	\$1,019,820	\$670,829
Aniseed oil.....	\$1,875	2,111	Rattan and manufactures.....	24,141	19,531
Cassia.....	51	92	Rice.....	1,713,126	2,638,582
Cattle.....	209,097		Shoes (Chinese).....	7,929	2,883
Cement.....	265,638	349,616	Silk piece goods.....	23,881	41,055
Clothing.....	9,616	6,259	Silk (raw).....	113,666	162,944
Earthenware and glassware.....	59,267	48,063	Soya.....	622	1,015
Fireworks.....	9,795	5,848	Sugar (refined).....	207,654	216,563
Flour.....	473	25,901	Tea.....	17,185	13,572
Fruit and vegetables.....	114,254	132,610	Tobacco.....	6,187	6,029
Metal and manufactures.....	60,873	71,653	Wine (Chinese).....	470	327
Medicine (Chinese).....	13,832	15,257	Wood and manufactures.....	44,292	37,760
Paper and manufactures.....	14,953	11,426	All other articles.....	930,640	908,415
Peanuts.....		41,524			
Peanut oil.....	44,847	79,519	Total.....	4,914,214	5,509,792

The heavy increase in rice was to make good the failure of the Philippine crop, and the increase in raw silk reflects the thriving condition of the pina, jusi, and other cloth industries in the Philippines. The decrease in provisions is accounted for largely by the enforcement of the quarantine regulations against uninspected lard. Shipments of cement, the product of the Hongkong factory, have reached almost the volume of those of 1909, when many large public works were in course of construction.

One of the chief features of the commercial relations of Hongkong and the Philippines is shipbuilding and repairing. Most of the larger

steamship interests of the islands have their repairing done in Hongkong shipyards where also launches, lorchas, lighters, and smaller craft generally and large vessels for the transport and interisland trade are constantly being constructed.

#### **The Transit Trade.**

While the great mass of Hongkong trade is in goods in transit to or from China, it also includes a large volume of goods to and from other sections of the Far East and Europe and the United States. As a result of the increased number of smaller ships and the tendency to send goods direct to the port of consumption and for other reasons the transshipment trade in Hongkong during 1911 was considerably less than in previous years. The transit trade in gunny sacks for the United States from India decreased materially, but there was a notable development of the trade in bone meal, due largely to lower freight rates. The trade in canes and bamboo materials from Indo-China to both the United States and Europe is growing, but transshipment of rattan has decreased. It is notable that not only has there been less movement of transshipped goods via Hongkong both ways between the Philippines and the United States or Europe, but there has been a material increase in goods from the eastern coast of the United States via Manila to Japanese and other northern ports.

While pessimistic opinions are heard occasionally as to the future of Hongkong as a shipping and transshipment port, the fact that the average size and speed of ships trading to the Far East are increasing, with the result that voyages must become more and more a matter of direct short runs from a principal port in the United States or Europe to a principal port in Asia, it is difficult to see how transshipment in Asia and distribution by smaller vessels can be avoided. This is the basis for the great transshipment trade of Hongkong and there is no reason to expect any great change.

#### **Immigration and Passenger Traffic—Industries.**

Steamers did an unusually good business in passenger traffic during 1911. The number of first-class passengers was larger and the number of emigrants leaving the colony was 135,565, as compared with 111,058 the year before and 77,430 in 1909. The number of immigrants returning was 149,894, substantially the same as in 1910. The passenger traffic between Hongkong and near-by points in China, particularly Canton, was the heaviest in the history of the coast, and aided in the restoration of normal conditions in coast shipping.

While there was an unfavorable season for the great sugar refineries, on the whole the year was a fair one for Hongkong's larger industries. The dockyards and shipbuilding establishments turned out more vessels, with notably greater tonnage, and dock work was increased. There was also general prosperity of a modest sort among various smaller industries both in Hongkong and its tributary territory—a prosperity to which American travelers contributed in no small degree.

#### **Reasons for Improvement in Shipping.**

The year in shipping has been marked by great improvements in nearly all services connecting China and Japan with the rest of the world, particularly in the character of the ships. There are two reasons for this. The first is a growing appreciation of the world-

wide effect on shipping of the Panama Canal and the second is improved business. It is now generally understood that most of the important lines from Europe to the Chinese coast by way of Suez will, on the opening of the canal, either establish services of their own by continuing the voyages of their ships from Hongkong or other eastern port to the Pacific coast and thence to Europe by way of Panama or will establish such working connections with existing Pacific lines as will insure them a part of the business to pass by the new route. Lines from New York to the Pacific coast of the United States by way of the canal will establish similar lines from the Pacific coast to China or connections which will amount to the same thing. It seems likely, therefore, that the importance of Hongkong as the shipping terminus of most lines to the Far East will be enhanced by these changes.

In general the shipping situation is distinctly better than in recent years. Coast lines, particularly those not subsidized, are still having a hard time maintaining themselves, but they were able to do so in 1911 and pay some slight returns on investments. Freight to Europe and to the east coast of the United States by way of Suez were raised about 10 per cent at the close of the year for effect in the current season. Freight across the Pacific, largely because of the subsidies, are still very low—probably the lowest in the world for similar distances.

#### **Restrictions on Trade—Banking and Finance.**

While there was a notable increase in imports in 1911 the commercial situation is by no means satisfactory. It is not free from danger, as a large part of the imports are lying in Hongkong and Shanghai warehouses and there has been no increase in consumption. The high course of exchange at the close of 1911, and especially in the first two months of 1912, makes the danger greater. The high value of the silver dollar gives Chinese importers a great advantage, since a silver dollar will buy more than an ordinary amount of foreign goods. The temptation is strong, therefore, to buy large stocks even without prospects of ready sale, and this is largely responsible for the increased imports of the past few months. If the condition of affairs in China becomes normal early enough in the present year to enable merchants to distribute their large stocks there will be no unfavorable result of the present state of affairs. But the possibilities of the situation were well illustrated in the high-exchange years of 1905–1907 when there were large imports of American and other cotton goods and when years of disastrous depression in the cotton piece-goods trade followed.

One of the first commercial results of disturbed conditions in China was a restriction of credits to merchants from middlemen and a consequent restriction of business. This is probably the chief obstacle to the normal distribution of goods at the present time. It has also increased the demand for specie and bullion and the demand for silver accentuates all the evils of a fluctuating standard of currency. In South China there has been no cessation of the coinage of silver 20-cent pieces, which are at a discount when compared with the corresponding standard dollar, the result being that retail prices generally are fixed in terms of 20-cent pieces, thus raising the price of goods to the consumer about 7 per cent.

**Need of Banking Facilities.**

The present situation has emphasized the need of adequate banking facilities in China for the accommodation of Chinese business men. This need has been felt to a greater or less extent ever since foreign trade was inaugurated, but in ordinary times the situation can be relieved to a certain extent by an extension of the operations of the foreign banks in the open ports (whose ordinary functions are those relating primarily to foreign-exchange operations) to include more or less support for the uncertain native banks and in some cases to carry importers in transactions which really appertain to the business of Chinese middlemen and should be handled by local banks for such middlemen. In times of stress these unusual functions of the exchange banks become impracticable if not entirely impossible. For example, the goods collected in warehouses since the troubles began can not be moved until more general credit is obtained. Under present conditions foreign firms and banking houses are in no position to extend credit beyond the open ports, and even there only with great restriction. Native banks could afford to go further in extending credits if the banks themselves could be trusted. Under revolutionary conditions this is impossible and the need of an adequate system of Chinese banks under proper supervision, with ample capital and honest methods, was never felt so acutely as now. It is encouraging that Chinese business men are the first to appreciate this fact, and both in Central and South China their first plans for business readjustment have contemplated native banks organized on a modern basis and with more or less foreign supervision. For example, it is proposed at Canton to raise funds for the organization of a bank by pledging the water front to foreign capitalists, the capital to be advanced as needed and the bank to be under foreign supervision and management. Funds for a bank with an initial capital of \$1,000,000 silver (about \$425,000 gold) are also being raised in Shanghai, and similar enterprises are on foot in nearly all of the ports south of Shanghai. Any such institutions will be of comparatively slight benefit until all are brought within some comprehensive scheme of governmental supervision and control, but in the meantime their establishment indicates the trend of business development.

The uncertain course of exchange during the opening months of the new year has already given an unfavorable start to the season, for while the high price of silver stimulates imports for a time, it so contracts exports that imports in turn are soon affected. Taxation in many lines has been suspended in the country for about half a year. In time this need of increased sources of revenue will stimulate trade, for it unquestionably means an opening up of the mineral and other resources of the country with immense benefit to both foreign and domestic trade. Probably the 1912 season will be very unfavorable in most commercial lines in this part of the world, but it will probably be followed by years of development.

**Prospects for Extensive Future Markets in China.**

There is certain to be an immediate construction of railways, with all the attendant development, and of modern schools, modern buildings, bridges, roads, waterworks, gas and electric light and power plants, and all kinds of public utilities and improvements. There is already an important change in the dress of the Chinese

people in the open ports, and more or less in the interior of the country, which is increasing the demand for foreign fabrics, particularly cotton goods and foreign shoes, hats, and dress novelties.

Factories for the manufacture of Chinese goods in a more modern way and for the manufacture of foreign goods now needed by the Chinese are springing up in all the open ports, and will arise all over China as soon as conditions become more stable. For all these there is an increasing demand for foreign machinery and appliances, especially for small plants and experimental machines. In short, China is entering upon its new era, and all that has ever been said and written about trade possibilities should now be resaid and rewritten as pertinent to the present moment. If ever American exporters and manufacturers were justified in establishing the expensive agencies which are the primary requirement of trade in the Far East it is at the present time.

Hongkong ordinarily furnishes about 36 per cent of all the imports of China, and the Hongkong imports also include great quantities of goods for distribution in all parts of the Far East, the South Seas, etc. Hongkong is the distributing point for South China and south-east Asia generally, and its trade may be taken as a measure of the trade of all this territory.

#### **Fluctuations in Trade in Cotton Yarn.**

The largest single element in the import trade of South China through Hongkong is cotton goods and cotton yarn. Taken as a whole, the year's business in both lines was far from satisfactory.

The yarn trade opened up briskly at the beginning of the year in sympathy with rising prices for cotton staple and a general bull movement in the trade. Prices for raw cotton came to such a point, however, that Europe drew heavily on India for staple, and China refused to pay the high prices demanded for Indian yarn. In September, when prices ran lower, it was expected that a considerable business could be done, and heavy orders were placed. With the outbreak of the revolution, however, came a closing of the interior markets, and the result was an immediate piling up of stocks in Hongkong. Stocks during the year averaged about 50,000 bales monthly, but the stock ordered in September for Chinese trade ran to about 250,000 bales. With the outbreak of the revolution monthly clearances fell to as low as 6,000 bales, and with the notable fall in the prices of Japanese yarn soon after there was all but a collapse of the trade.

Prices during the first half of the year ran about \$140 Hongkong currency (\$60 gold at average exchange) per bale for 10's, \$145 (\$62.30 gold) for 12's, and \$160 (\$68.60 gold) for 20's. By the close of the year they had fallen, on an average, about 15 per cent for the 20's and about 10 per cent for the 10's and 12's. The tendency at the opening of the current season was downward.

#### **Accumulation of Cotton Piece Goods.**

The record of the year in cotton piece goods in Hongkong, on the whole, was little if any better than that of the unfavorable previous year. During the earlier months the high price of cotton in the United States and elsewhere made it impossible for the average consumer in China to purchase foreign goods and the result was a greatly restricted business. As the price of cotton fell, purchases of foreign goods

increased, but the disorders in the interior during the summer and the revolution in the autumn interfered with shipments of goods and also restricted credits greatly. Shipments both from Europe and the United States continued in spite of the situation here, the comparatively small volume of imports from the United States during the year amounting to about twice the value of those imported in the previous year; but with no sales here the goods received were simply warehoused, so that the opening of the current season found large stocks on hand and considerable uncertainty as to the immediate future. The situation about the close of 1911 became so serious that orders were countermanded freely, and only the willingness of the mills to adapt themselves to the situation prevented disastrous consequences. There were numerous refusals to accept orders on the part of Chinese middlemen, but there was much less trouble of this sort than might have been expected.

There seems to be no question but that the cotton-goods trade in the Hongkong territory and probably in all China is at a turning point. While it is easy to overestimate the effects of the revolution in such matters, the actual existing tendencies in social and commercial lines—as, for example, the disposition of a large portion of the Chinese people in treaty ports and even in interior cities to take up with foreign-style clothing and foreign articles generally—are certain to have an important effect on trade. In Hongkong and near-by ports there has been a change in the demand for cotton goods which is already apparent. The demand for woollen cloths and cotton goods in imitation of wool or of a style to suit Chinese ideas of foreign clothing has increased immensely, while there has been a marked decrease in the comparative demand for goods suitable for Chinese clothing of the old style. This change may or may not become universal in China, but it is already of material proportions and the new demand promises to be indefinitely extended.

At present the cotton-goods situation all over China is uncertain and unsatisfactory. While the stocks accumulated would not be particularly excessive if consumption were normal, the uncertainty of demand and the possibility that many markets in the interior may be shut for months give little promise of trade betterment for some time to come.

#### **Flour Trade Greatly Increased.**

A failure of the rice crop in various sections of the Far East, accompanied by comparatively low prices for flour in the world's markets, caused an immense movement of flour to Hongkong, in which the United States, as usual, had the principal part. The total imports for the year were 5,512,502 49-pound bags, of which 5,353,554 bags were imported from the Pacific coast of the United States. The record for the year has been exceeded only in 1900 and 1901. The boom in 1911 extended over into 1912 and 1,000,000 bags of flour arrived in three ships alone during January, one ship, the *Minnesota*, having 500,000 bags aboard.

One of the reasons for this heavy import is the condition of the Yangtze Valley mills because of revolutionary troubles, foreign competition, etc. How long their suspension will continue it is, of course, impossible to tell, but in time it is probable that their business can again be established and American flour will again feel their compe-

tition. At present, however, American mills have only to concern themselves with the possible competition of Australian mills, which are gaining considerable trade not only in China but in the East Indies and other territories where American flour has been used, and with their own high prices. High prices of flour in the United States result in an immediate reduction of the trade in China, as the Chinese can not afford to buy foreign flour at prices much higher than those obtaining during 1911. With conditions remaining as they now are a large trade may reasonably be expected.

**Oil Imports Also Much Greater.**

The imports of mineral oils into Hongkong during 1911, according to the best information at hand, amounted to a total of 47,620,000 gallons, an amount exceeding all previous records in the trade by about 50 per cent. These immense imports, however, are not a measure of consumption, as more than half of them are now in warehouse in Hongkong, whereas at the beginning of 1911 there were very small stocks of oil in the colony. There has been a great increase in consumption in line with the campaign started over a year ago by the companies concerned in the trade by a general lowering of prices. Of the imports during 1911, 25,000,000 gallons were imported by the Standard Oil Co., about 620,000 gallons by other American companies, and 22,000,000 gallons from all other sources, practically altogether from the East Indian fields.

At this writing (Mar. 21) there are on hand in Hongkong about 16,500,000 gallons of case oil and about 8,000,000 gallons of bulk oil. Most of this is for sale and transshipment to other ports, the actual consumption in Hongkong of all oils averaging about 1,800,000 gallons per year. The actual deliveries for consumption from Hongkong warehouses and tanks during the past year have been approximately 20,000,000 gallons as compared with 13,530,000 gallons in 1910, 11,700,000 in 1909, and 11,440,000 in 1908.

During 1911 prices averaged \$3.50, \$2.75, \$2.25, and \$1.95 Hongkong currency with variations of 20 points either way for the several grades of American oil and \$2.50, \$2.35, and \$2.20 for the three most popular grades of East Indian oils with variations of 30 points either way.

Imports of oil into Hongkong depend upon freights, the price of oil in the United States, production of oil in the United States and the East Indies, and many other elements besides actual consumption here. With the vast stocks now on hand in Hongkong it is doubtful if there will be any material imports during the first half of 1912 and the imports during the whole of the season may be small.

**Machinery, Building Materials, etc.**

Imports of machinery decreased in 1911, though business during the earlier months was promising. New enterprises have been held back pending the settlement of questions of government and this has interfered with the sale of machinery. There has been a steady increase in the sale of marine motors, small dynamos and general electrical goods, fans and ventilating apparatus, elevators, typewriters, knitting machines, etc., and in the imports of automobiles and parts, but the limit of the latter trade has probably been reached for the

time being. The disorders in the interior have seriously interfered with the trade in sewing machines in which the United States particularly is interested, but with the return of normal conditions sales will expand greatly. A few Chinese contractors in Hongkong are commencing to use modern machinery like concrete mixers, hoisting engines and the like, but the trade is limited at best.

Demand for foreign hardware is steadily increasing, particularly for cutlery and building hardware, glass of the more ordinary grades, and various building materials such as I-beams, nails, rods, and reinforcements for concrete construction. Nearly all lines of iron and steel show increasing trade. In most of the lines mentioned, however, the general increasing course of trade was interrupted at the close of the year and the halt has continued into the present season though it is expected that normal conditions will soon be restored.

Although forbidden by law, there was a large trade in arms and ammunition during the year. Deliveries were made outside of Hongkong or Chinese waters but on orders placed in Hongkong, and as there was a considerable trade in arms for personal defense, for several months all such goods here were at a premium.

#### Poor Year for Sugar.

The general undersupply of sugar the world over seriously affected the Hongkong sugar trade and the great refineries in the colony handled less than two-thirds of the business they had two years ago and more than one-sixth less than in 1910, which was a poor year. The imports of sugar by places of origin during the past three years have been as follows:

Imported from—	1909	1910	1911
	Tons.	Tons.	Tons.
United States.....	2		1
Burma.....			89
China.....	12,108	14,719	8,950
Cochin China.....	5,012	3,608	2,373
Germany.....	16		38
Java.....	278,030	221,101	184,874
Japan.....			89
London.....	16	15	6
Mauritius.....	400	586	899
Hongkong New Territory.....	62	164	3,029
Philippine Islands.....	41,930	10,372	9,324
Straits Settlements.....	2,108	1,284	71
Total.....	339,684	251,819	208,743

The exports amounted to about 160,000 tons, most of them, as usual, going to North China. There was an increase in shipments of sugar to the United States and the Philippines during the year, however, and it was shown that with a free market on the Pacific coast a considerable trade could be developed. The particularly small turnover of the Hongkong refineries was a result of the high price of sugar the world over, which had the immediate effect of reducing the demand for refined sugar in North China and thus cutting off Hongkong's principal outlet for sugar. It was significant that much of the raw Philippine product imported into Hongkong during the earlier part of the year was returned to Manila during the prevalence of high

prices, in the latter part of the season, in some cases being sent back in a raw state.

#### Revised Agreement with England in Opium Trade.

The great event in the opium trade in 1911 was the revised agreement between China and Great Britain as to imports of Indian opium, as a result of which the trade is to be suppressed in less than the original time agreed upon, provided China can show a corresponding suppression of domestic production. The agreement also provides for additional taxation. Up to the breaking out of the revolution China was able to show an immense reduction in the production and use of the drug; but as a part of the agreement China was to admit at the old tax all opium in Hongkong and the treaty ports or en route to either, and as a result about 21,000 chests were admitted at one time from stocks at such ports. It has been agreed, however, that in addition to the decrease in imports from India under previous treaty arrangements there will be an additional reduction during each year for the next three years of one-third of these stocks thus admitted in 1911. Under the general agreement between Great Britain and China the sales of Indian opium during 1911 were not to exceed 30,600 chests, but with the shipment of Hongkong and other stocks into the country the actual sales amounted to about 51,000 chests, or more than the imports theoretically permitted in 1910. The amount theoretically to be imported into China during 1912 under the revised agreement and the further reduction noted will be 18,500 chests; in 1913, 13,400 chests; in 1915, 10,200 chests; and so on, the imports disappearing in 1917.

During 1911 there were great fluctuations in prices. In September the abnormal figure of \$5,000 local currency or \$2,150 gold per chest of 152 pounds was reached, the previous year's highest figure being \$2,850 local currency. The revolution greatly upset the trade, and prices fell away to \$3,700 or \$1,665 gold (at the exchange of that date) per chest at the close of the year. In Malwa prices rose to the high level of \$4,500. The trade in Persian opium, which ceased in 1911 so far as China was concerned, resulted in prices varying between \$1,800 and \$3,500 local currency. The course of the trade during the year in Hongkong, as reported in the Hongkong Government returns, was as follows:

	1911	1910
	<i>Chests.</i>	<i>Chests.</i>
Stock on hand Jan. 1.....	7,123	4,500
Imported during year.....	21,286	31,743
Total.....	28,409	36,252
Consumed, etc.....	781	796
Exported.....	20,061	28,333
Total.....	20,822	29,129

During the year 1,678 chests of noncertified opium were imported, of which 299 chests were exported to Macao; 535 to Kwangchow; 7 to Panama; and 414 were consumed, leaving 423 chests on hand. Trade in morphia and cocaine material decreased during the year, particularly in the latter part.

**Imports of Coal Show Little Change.**

There was little change in the coal trade. The imports in 1911 amounted to 1,261,671 tons, as compared with 1,280,330 tons in 1910 and 1,219,930 tons in 1909. The feature of the trade was the rise in prominence of several sources of supply in the vicinity of Hongkong, particularly Hongay in Indo-China and Pulo Laut in British North Borneo.

Japanese coal continues to dominate the market absolutely, and there is less and less disposition to buy Welsh coal for any purpose. The imports in detail for the past three years have been as follows:

Imported from—	1909	1910	1911
	<i>Long tons.</i>	<i>Long tons.</i>	<i>Long tons.</i>
Cardiff (including patent fuel).....	46,000	46,000	36,200
Australia.....	46,500	9,700	.....
Japan and Formosa.....	924,780	932,780	932,856

Manchuria.....	17,250	86,000	53,575
Labuan.....	3,000	.....	.....
Miscellaneous.....	.....	4,100	.....
<b>Total.....</b>	<b>1,219,930</b>	<b>1,286,330</b>	<b>1,261,671</b>

**General Condition in Export Trade—Human Hair.**

The general course of the export trade was normal until the rise in exchange, coincident with the revolution, in October. Orders placed previous to that time went forward, but the high exchange prevented any general maintenance of trade in good volume into the current year. In the last two months of the year the revolution interfered considerably with deliveries.

Exports of human hair greatly increased in the latter half of 1911. In 1910 the climax of the trade came in the first six months when total exports to the United States from Hongkong reached a value of \$516,410. In the latter half of 1910 the market collapsed and the exports to the United States amounted to only \$178,727. For the first six months of 1911 the amount fell to \$53,853, but the latter half showed a value of \$241,452, making the total for the year \$295,315 as compared with \$695,137 in 1910, \$327,559 in 1909, and \$92,209 in 1908.

Shipments from the Hongkong market in 1911 to all countries were much larger in volume than the year before, aggregating about 1,759,833 pounds as compared with about 1,200,000 pounds in 1910, a great proportion of them, however, being of low-grade hair. It is doubtful if the total value of the season's shipments will exceed \$900,000 gold as compared with a total value of \$1,500,000 in 1910. Prices at the close of the year were firm and showed a marked disposition to rise. The cutting of queues, instead of increasing the supply of hair in this part of the world, is gradually doing away with the source of supply and with only the same amount of effort in collecting the amount available will soon fall far short of the demand.

**Increased Shipments of Tin.**

In spite of the fact that the output of tin from the Yunnan mines, which is refined in Hongkong, was about twice the shipments of 1910, the year was a disastrous one to the local trade owing to the collapse of the market about the middle of the year. The figures of the Hongkong General Chamber of Commerce show shipments to Great Britain in 1911 of 9,126 slabs as compared with 3,395 slabs in 1910 and shipments to the continent of Europe of 10,626 slabs as compared with 5,815 slabs in 1910, a total of 19,752 slabs, or 2,212,224 pounds, in 1911 compared with 9,210 slabs, or 1,031,520 pounds, in 1910.

A large portion of the shipments to Europe are made on option for the United States and the latter country takes a much larger share of the output than the figures indicate. Declared exports to the United States direct from Hongkong amounted in value to \$798,941 as compared with about \$750,000 the year before. About 55 per cent of the shipments were made in the second quarter, while in the following quarter no shipments whatever were made.

Prices during the second quarter ran so high that Hongkong smelters entered into engagements with producers in China at high prices. When the collapse of the market came exporters were caught with a considerable stock of tin bought at high prices, which they held as long as possible in the hope that the market would come within their reach again, but during the last quarter of the year they began to sell in small quantities at a loss. Shipments during the March quarter were valued at \$181,812; during the June quarter \$433,685; and during the December quarter \$183,444.

At the opening of the present season in Hongkong smelters and dealers held at least \$1,800,000 gold worth of tin at current market prices. During 1911 prices in Hongkong varied from \$96 to \$126 Hongkong currency per picul of 133½ pounds—from 72 to 94.5 cents Hongkong currency, or 30.9 to 40.6 gold cents, per pound at exchange of 43 gold cents to the Hongkong dollar.

**Losses in the Rice Trade.**

In spite of great activity in the rice trade during parts of the year local middlemen lost heavily on the year's business. The trade in general opened briskly and in fact was above the normal for the first three months, the imports from Saigon exceeding those of any previous spring quarter. Later supplies were smaller and on the average the receipts were normal during the year until August. At that time the successive failure of crops in the Philippines, Indo-China, Burma, and elsewhere in the Far East led to famine conditions, and Hongkong dealers bought all the supplies they could get, at prices ranging up to twice normal values. With action on the part of various governments in the Far East to protect their people from a corner in the staple and with the appearance of reserve stocks prices fell off about \$20 gold per ton at a time when local middlemen had 35,000 tons in warehouse in the colony, and that figure represents their direct loss on substantially that amount of grain held, not including their losses on grain not received here.

The result has been that in spite of the prospect of a poor year in rice production all over the East and short supplies for all of the consuming countries commercially tributary to Hongkong, stocks

held are small and there is a strong indisposition to carry any stocks of material size. The end of the year found about 7,000 tons in Hongkong warehouses. The total trade handled during the year was probably about 300,000 tons below the average. Prices ranged over a wide margin, reaching about \$75 gold per ton during the height of the shortage—substantially twice the average ordinary price. At no time during the season were prices low.

#### Cassia and Cassia Oil Shipments.

There was a brisk trade in cassia of various grades and in cassia oil during 1911, and the United States participated in the increase. Shipments of cassia oil to all ports amounted to 2,200 62-pound cases as compared with shipments of about 1,400 cases in 1910. The course of the market was rather uncertain at the opening of the season, a speculative group in Hongkong cornering the supply and forcing the price from an average of \$210 local currency per picul—about 66 cents gold per pound—to as high as \$260 local currency per picul, or about 82 cents gold per pound. Prices after this flurry held to a normal level until the breaking out of the revolution in October, when, by reason of interrupted deliveries from the interior, the supply fell short and prices again advanced to the high point noted. Dealers in Europe and the United States refused to pay the advance, however, with the result that except on forward contracts little oil was shipped during the last quarter of the year. The price closed about 5 per cent above the average level.

In the various grades of cassia there was an immense increase in shipments both in the Chinese and the Indo-China or Saigon product. Chamber of commerce figures report total shipments for the year as follows, in boxes of 62½ pounds net:

Destination.	1910	1911
Continental Europe:	<i>Boxes.</i>	<i>Boxes.</i>
Lignea.....	23,803	50,662
Broken.....	11,000	23,135
Great Britain.....	8,190	5,537
United States.....	27,076	63,329
Total.....	65,269	142,663

Of the total amount exported about 80,000 cases were of cassia lignea and the rest of broken cassia. The average price of lignea during the year was \$18.80 local currency per picul, or about 5.9 cents gold per pound, while in 1910 it was about \$19.80 local currency or, at the same exchange, about 6½ cents gold per pound, which was also the prevailing price at the opening of the season of 1911. The general decline was due rather to the need of ready money in China than to any slackening of demand in the United States or Europe or any oversupply here. The value of shipments of cassia and cassia oil to the United States increased from \$244,042 in 1910 to \$278,845 in 1911.

#### Losses in Silk Trade.

In the silk trade also there were losses from poor buying on the part of exporters. The first half of the season was dominated by a strong demand for nearly all lines from the United States, and exporters bought stock in the belief that such demand would last

indefinitely, and for the same reason producers insisted on high prices for their silks. A great Japanese crop, however, gave an unusual supply and prices fell off accordingly, while exporters held to their wares in the hope of a recovery of prices. They sold grudgingly later at a loss. The trade in raw silk was very much depressed during the closing months with large stocks on hand and a weak demand, but the movement of waste silks was good during the whole season and the year's supplies were partially cleared. The year's crop in the Pearl River delta is estimated at about 20 per cent less than that of the previous season. The year's shipments of raw silk from Hongkong totaled 42,883 bales of 112 pounds net as compared with 54,129 bales in 1910. Stocks on hand in the market amount to about 8,000 bales as compared with about 2,000 bales last year. Commercial returns report the comparative exports of silk products during 1910 and 1911 as follows:

Exports.	To Europe.		To the United States and Canada.		Total.	
	1910	1911	1910	1911	1910	1911
Raw silks.....	<i>Bales.</i> 34,609	<i>Bales.</i> 27,847	<i>Bales.</i> 19,520	<i>Bales.</i> 15,036	<i>Bales.</i> 54,129	<i>Bales.</i> 42,883
Waste silks.....	28,298	28,415	8,366	7,577	35,664	35,992
Pierced cocoons.....	4,464	5,161	943	800	5,407	5,961
Total.....	68,371	61,423	26,829	23,413	95,200	84,836

Prices declined about 10 per cent during the year and the season of 1912 opened with poor prospects.

#### Good Trade in Mats and Matting.

There was a smart recovery in the volume of the manufacture and export of straw mats and matting during the year. The exports of mats particularly took a spurt, an unusual demand coming from Europe, and estimated to have exceeded 16,000,000 pieces as compared with about 12,500,000 pieces in 1910. Exports of matting, according to the figures of the Hongkong Chamber of Commerce, aggregated 343,000 rolls as compared with 79,763 rolls in 1910. Of these shipments 34,288 rolls went to Great Britain, 90,000 to the rest of Europe, and 218,532 to the United States and Canada. These figures, however, are probably less than the actual amount shipped, as shipments from Canton alone during the first nine months of the year aggregated 324,668 rolls and the amount from Indo-China handled during the year was unusually large. The continent of Europe, particularly the Netherlands, was an unusually good market during the season.

Prices were very unsatisfactory to the trade generally and particularly to the manufacturers. At the opening of the season they were the lowest recorded and if the people of the districts concerned had not simply been forced to do something to live there would have been no greater trade in all probability than the depressed trade of the past two years and a half. The interference by disorders last spring and by the revolution which not only made deliveries uncertain but also made the transmission of cash money into the interior difficult, led to some slight recovery in prices. The trade generally, however,

though large in volume is not in a healthy and satisfactory condition and much improvement can not be expected until prices in the United States and Europe change.

**Vegetable Oils, Meats, and Provisions.**

In line with the increased world demand for vegetable oils there was a marked increase in the year's shipments from Hongkong to Europe and the United States of wood, tea, nut, peanut, and bean oils. There are no reliable figures as to the amounts exported, but the total was near 30,000 tons, valued by the Chinese customs at about \$2,900,000, an increase of about one-third over 1910. Exports to the United States increased in about the same proportion, shipments of peanut oil, for example, being valued at \$300,866 in 1911 and \$228,296 in 1910. This trade is still on the increase; and steel drums sent out empty from the United States for oil are now being used.

During the year there was a suspension of the meat and lard shipments to the Philippines for a time, and the trade, which amounted to a trifle over \$1,000,000 gold, exclusive of live cattle, in 1910, fell off about a third. This, however, was due to the enforcement of the pure-food law in the Philippines and not to actual trade conditions along the South China coast from which such supplies are drawn. Toward the close of the year modern factories which met all requirements of American and Philippine regulations were established and the trade has been renewed upon a larger scale.

The present indications are that during 1912 more meat and lard will be shipped from Hongkong to the United States and the Philippines than ever before. Besides the modern lard factories established at Hongkong, one has been built at Canton, the output of which is handled by Hongkong middlemen, and arrangements are being made for drawing upon the live-stock supplies as far north as Ningpo for Hongkong shipments. There is apparently no reason why the export of meat and meat products from South China should not be carried on to a very large extent.

There has been a prejudice against Chinese meats, particularly pork products, all over the world, which at times and in some localities has been justified. At the present time, however, both in South China and the Yangtze Valley, meat and meat products of high quality are being produced which have met every test both here and in Europe; and with arrangements now already made in some localities for the careful examination of all animals and meats and meat products by officers qualified by American or other foreign training, there is no occasion for further prejudice. Meats can be produced in South China and the Yangtze Valley, and indeed all over China to some extent, at a price to compete successfully with meats from any part of the world, and shipment of Chinese meats, and Chinese lard particularly, to the Pacific coast of the United States is a strong probability of the near future.

**Sales of Tea, Canes, Batts, etc.**

Exports of tea were considerably less than in 1910, although the crop was greater. In 1911 a total of 65,454 chests were sent out, as against 90,883 chests in 1910. For South China teas there is no life in the market and none in prospect. Shipments from Hongkong to

the United States in 1911 were almost entirely of miscellaneous lots for the use of Chinese.

The export trade in canes for various purposes, including both the fancy canes from Indo-China and the more ordinary variety from the Pearl River delta, has been on the increase. The figures of the Hongkong Chamber of Commerce show total exports of 47,414 packages in 1911, but it is probable that the actual shipments were considerably larger. About half of the entire trade goes to the continent of Europe, Great Britain taking about two-thirds of the balance and the United States the rest, including, however, some shipments to Canada.

Shipments of rattan and rattan furniture have fallen off considerably, those to the United States, for example, amounting to only \$58,497, as compared with \$80,328 the year before. Exports of Chinese blackwood and other furniture to the United States and Europe increased about 25 per cent, though the volume of the trade as yet is not large. There is a constantly growing trade in Chinese and other embroideries out of the port, including embroidered silk piece goods, "Swatow" grass-cloth work, drawn work of various sorts, and many other products of a similar nature which have been introduced in the United States and Europe to a greater or less extent by tourists passing through this portion of the world.

In general, there was a falling off in exports of goods for the use of Chinese abroad, such as tinned Chinese foods, Chinese clothing, Chinese medicines, and Chinese novelties.

#### **Firecrackers and Bristles.**

Exports of firecrackers during 1911, according to the figures of the Hongkong General Chamber of Commerce, amounted to 97,434 cases, as compared with 60,081 cases in 1910. The exports to Great Britain in 1911 were 12,866 cases, as compared with 11,595 cases in 1910; to the continent of Europe, 7,092 cases, as compared with 3,541 cases in 1910; and to the United States and Canada, 77,476 cases, as compared with 44,945 cases in 1910. These figures are from commercial sources and are probably considerably under the actual volume of trade, but they indicate the general trend. Fewer firecrackers were invoiced out of the Hongkong consulate for the United States in 1911 than in 1910.

Shipments of bristles also showed notable improvement, those to Great Britain amounting to 2,620 bales, as compared with 863 bales in 1910; to the continent of Europe, 6,926 bales, compared with 5,772 bales in 1910; and to the United States, 688 bales, compared with 305 bales the year before.

[Reports already printed dealing with conditions in Hongkong have appeared this year as follows: Steamship service, Apr. 2, May 9; ginseng, Apr. 6; tea trade, Apr. 12; flour imports, Mar. 5; trade in human hair, Feb. 28.—B. of M.]

---

"Electric Vehicles in England and the Difficulty of Battery Charging" is the subject of a lengthy report forwarded by Consul Albert Halstead, of Birmingham, and which will be loaned to interested firms on application to the Bureau of Manufactures, Washington, D. C.

## OUTPUT OF CANADIAN BUTTER AND CHEESE FACTORIES.

[From Census and Statistics Monthly.]

The census records of butter, cheese, and condensed milk produced in Canada in 1910 show that there were 3,628 factories in operation that year. The quantity of butter made was 59,875,097 pounds, having a value of \$15,682,564; the cheese output was 231,012,798 pounds, worth \$21,620,654. This was an average of 26.2 cents per pound for butter and 9.36 cents for cheese, in contrast to respective averages of 20 cents and 10 cents a pound in 1900.

The factory production of butter and cheese in 1900 and 1910, by Provinces, was as follows:

Provinces.	1900		1910	
	Pounds.	Value.	Pounds.	Value.
<b>BUTTER.</b>				
Alberta.....	406,120	\$82,630	2,140,121	\$533,423
British Columbia.....	395,808	105,690	1,208,202	450,683
Manitoba.....	1,557,010	292,247	2,050,487	511,972
New Brunswick.....	287,814	58,589	849,633	212,205
Nova Scotia.....	324,211	68,696	354,785	88,481
Ontario.....	7,559,542	1,527,935	13,699,153	3,482,171
Prince Edward Island.....	562,220	118,402	670,913	156,478
Quebec.....	24,625,000	4,916,756	37,346,107	9,895,343
Saskatchewan.....	339,014	70,037	1,548,696	381,809
Total butter.....	36,056,739	7,240,972	59,875,097	15,682,564
<b>CHEESE.</b>				
Alberta.....	27,693	3,970	193,479	23,473
Manitoba.....	1,289,413	124,025	694,712	81,403
New Brunswick.....	1,892,686	187,106	1,166,243	129,677
Nova Scotia.....	568,147	58,321	264,243	29,977
Ontario.....	131,967,612	13,440,987	157,631,823	14,845,661
Prince Edward Island.....	4,457,519	449,400	3,293,765	354,378
Quebec.....	80,630,199	7,957,621	67,741,802	6,152,689
Saskatchewan.....			26,730	3,396
Total cheese.....	220,833,269	22,221,430	231,012,798	21,620,654

The increased price of factory butter led to a larger production in 1910 than in 1900, and this was made, especially in Quebec, at the cost of a smaller production of cheese. The change was further induced by the lower rate of duty on cream in the United States, which encouraged exports to that country.

The number of condensed-milk factories in operation increased from 4 in 1900 to 12 in 1910, and the value of the output from \$269,520 to \$1,839,871. There are now 6 factories in Ontario, with a product value of \$1,335,689; 2 in Nova Scotia, with \$133,956; 2 in Quebec, with \$275,000; 1 in British Columbia, with \$44,326, and 1 in Prince Edward Island, with \$50,900. In 1900 there were 2 factories in Nova Scotia and 1 each in Prince Edward Island and Ontario.

**Mixed Packing Causes Damage.**

Consul Maxwell K. Moorhead, of Rangoon, calls attention to an instance of bad packing that came under his observation. Nails, plumbago, and toothpicks, shipped from Chicago, were packed in one case, with the result that the toothpicks were completely demolished. The shipper, however, acted in a very fair way and paid for the damage.

**LINEN YARNS AND PIECE GOODS.**

(From Consul Hunter Sharp, Belfast, Ireland, May 8.)

A very satisfactory increase is shown in the exports of linen piece goods from the United Kingdom for March and for the three months ended March 31, 1912, as compared with the corresponding periods of 1911. A particular feature is the increase in the shipments to the United States. The total exports to that market in March amounted to 15,111,500 yards, the heaviest yardage in any single month since January, 1910. The demand from South American markets dropped somewhat, but India continued to forge ahead and Canada improved slightly, while there was little actual change in the shipments to Australia and New Zealand.

The exports of linen yarns and linen piece goods from the United Kingdom during the first quarter of 1911 and 1912 are summarized below:

Linen yarn and piece goods.		1911	1912
<b>YARN.</b>			
Total exports.....	value..	\$1,577,008	\$1,586,410
Total quantity.....	pounds..	4,878,000	4,681,900
To United States.....	do.....	424,900	591,600
<b>PIECE GOODS.</b>			
Total exports.....	value..	\$7,513,910	\$7,683,440
Total quantity.....	yards..	54,604,100	55,700,300
To United States.....	do.....	30,466,900	34,401,900

While the demand for most classes of manufactured goods has tended to go a trifle slower, there has been no check to the upward trend of prices, and linen buyers who have been keeping out of the market in the hope of securing more favorable terms are faced with a much stronger position than that which ruled earlier in the year.

**Increased Cost of Production—Flax-Crop Outlook.**

Costs of production have increased substantially since the beginning of the year, and, taking these into account, manufacturers' quotations are said to be, if anything, still on the low side. The advance has been most pronounced in tow yarns, and spinners are quite indifferent about fresh contracts for tows, owing to their already heavy engagements and the increasing difficulty in securing suitable raw material.

The increased cost of fuel is also a factor affecting the price of the finished article; and though quotations for coal have shown some decline with the resumption of work on the part of the miners, there is every probability of a permanent increase as compared with recent years.

The outlook for the new season's flax crop on the Continent and in Ireland is not encouraging, as a substantial decrease in the acreage appears certain. In Belgium it is the general belief that the sowing, which is now practically completed except in a few late districts, will be smaller than in 1911, while in the Netherlands it will be about one-third less. In Ireland the reports indicate smaller sowing than last year, and, though in some districts a small increase

is thought likely, it seems to be the opinion here that there may be a falling off of 15 to 20 per cent. Last year's yield was very unsatisfactory, and despite the high prices the net return of the grower offered little inducement to a larger sowing.

### INDIA TRADE NOTES.

[From Consul Stuart K. Lupton, Karachi.]

*Gross railway earnings* of India for the past official year are reported at \$164,079,898, a gain of \$14,670,990 over the previous year.

*The Kalka-Bayenath railway* survey, in the Punjab, with a length of 169 miles, 2 feet 6 inches gauge, has been sanctioned, to be undertaken by the Northwestern Railway.

*Molasses imports* at Karachi from Java are increasing heavily, owing to the great rise in price of the native article. The molasses is largely used for distilling spirits at Kotri and other up-country points.

*The Karachi Port Trust* reports that the year ending March 31, 1912, was the most successful on record. Receipts were \$1,300,840, or \$147,794 in excess of the budget estimates and \$151,344 in excess of the previous record, that of last year. Expenditures were \$1,012,743. While the total trade of the port amounted to \$149,224,000, the port charges thereon were over \$1,324,000, and in Bombay, on a trade amounting to \$613,116,000, charges were only \$2,789,840, showing that port charges at Karachi are more than double those of Bombay.

#### **The Northwestern Railway.**

The Northwestern Railway, which is practically the only means of transportation in this consular district, had a most successful year in 1911-12. Earnings amounted to \$26,503,480, as compared with \$23,908,280 in the previous year. The tonnage delivered at Karachi was a record.

A great deal of difficulty was experienced in handling the traffic, as the double track only extends 400 miles, from Karachi to Samasata. In addition, imports of coal from Bengal enormously increased in the latter part of the year, owing to the coal strike in Great Britain, while large quantities of fodder were shipped out of this district to relieve scarcity in other parts.

The budget for the coming year includes \$3,406,200, for increased facilities on the open lines, with a further \$4,622,700 for additional rolling stock. On January 1, 1912, sanction had been obtained for 137 locomotives, 362 passenger cars, and 2,562 freight cars, a large portion of which had been already contracted for. [The name of the person in India who is making the contracts at the present time for this class of supply may be had from the Bureau of Manufactures, at Washington.]

New construction is responsible for an allotment of \$1,735,540, and work is being pushed on the following branches: (1) Jakhal-Hissar, 50 miles; (2) Bannu-Khalabagh, 90 miles; (3) Serai Kala Havelian; (4) Jullundur-Hoshiapur, and it is hoped that they will be in operation by the end of the present fiscal year.

**SOUTH AFRICA'S FLOUR TRADE.**

[From Consul E. A. Wakefield, Port Elizabeth.]

From present indications flour will be produced more extensively from year to year in South Africa.

Ostriches and cattle have in the past occupied the attention of the average farmer to an extent that has prevented an extensive crop production. Conditions of the soil in many sections, combined with a light and uncertain rainfall, have been leading factors in the farmers' decision to depend principally on stock raising.

Recently there has been a decided tendency to generalize farming wherever conditions are at all favorable. This tendency has been encouraged by public men generally, and by the Government and its agents especially, throughout the South African Union. As an example may be cited the recent acquisition of a large tract of land in Cape Province near Carnarvon for producing wheat. About 200,000 acres are reported to be suitable for wheat growing, and this year's product, with only a small portion under cultivation, approximates 25,000 bags. In the opinion of thoroughly informed men, proper conservation of water and proper irrigation will permit abundant crops of wheat in many sections where little or none is now produced.

Imports of wheat into the Port Elizabeth consular district during 1910 amounted to \$1,827,000 and in 1911 to \$1,468,000, of which 90 per cent was from Australia.

**Imports and Exports—Terms and Packing.**

Flour imports for 1910 amounted to \$850,000 and to \$803,000 for 1911. Of these imports, Australia supplied more than 56 per cent, Canada over 38 per cent, and the United States a little above 3 per cent. In flour imports for 1911, as compared with the figures for 1910 for South Africa, Australia shows a falling off of \$100,000 and Canada a loss of over \$25,000, while the United States gained \$9,000. This is, perhaps, in a measure accounted for by the presence of a local representative of one of the large American milling companies.

Quite a considerable portion of the wheat imported is ground in bond and exported as flour to other sections of Africa not included in the Union. Flour exports from the Union of South Africa are nearly all to German Southwest Africa and amounted in 1911 to about \$230,000, of which only \$30,000 worth was from locally grown wheat. Flour exports for 1911 exceeded those for 1910 by \$25,000.

Flour is purchased from milling companies direct and also through commission agents. [A list of importers of flour in the Port Elizabeth consular district may be obtained from the Bureau of Manufactures.] Terms are usually either cash on presentation of shipping documents or drafts payable 30 days after presentation of documents. Sixty or ninety days' credit is readily obtainable, if desired, by reputable firms. Letters of credit from purchaser to seller are quite commonly used, more especially in wheat transactions.

Flour is nearly all packed in single sacks of white cotton or hessian, containing 98 pounds. Some flour is imported in 25 and 50 pound sacks and some is double sacked, but those are exceptions rather than the rule.

**Grades—Prices for Imported Flour.**

There are numerous grades on the market, but the bulk of flour sold is of the soft-wheat variety. Australian flour is nearly or quite

all made from soft wheat. Canadian flour is composed of entire hard-wheat flour, and a variety of blends of hard and soft wheat. South Africa produces both hard and soft wheat, but the bulk is soft. Local mills manufacture blended wheat and soft-wheat flour, but, so far as can be ascertained locally, none from entire hard wheat.

Purchasers are certain to buy where they secure the best satisfaction—price, quality of product, and prompt delivery being the principal considerations. Other conditions being equally satisfactory, most importers would prefer to deal direct with the manufacturer. Present (April) prices for imported flour, per bag of 98 pounds net, are:

No. 1 Canadian hard wheat.....	\$2. 75
No. 2 Canadian blend hard and soft wheat.....	2. 71
No. 3 Canadian blend hard and soft wheat.....	2. 69
No. 4 best Australian soft wheat.....	2. 43

These prices are for shipments c. i. f. Port Elizabeth, but do not include duty or landing charges; 63 to 67 cents should be added to the above figures to represent the landed cost of these products. There are at least two cheaper brands of Australian flour on the market.

#### The Local Product.

Quotations per bag of 98 pounds (net) for locally manufactured flour are:

No. 5 Canadian and Australian wheat.....	\$3. 65
No. 6 hard and soft wheat blend.....	3. 53
No. 7 same as No. 6, with less hard wheat.....	3. 40
No. 8 blended local wheat.....	3. 40

These are prices quoted at the local mills, of which there are four, and a sample from each mill is submitted. [These samples will be loaned by the Bureau of Manufactures.] Discounts vary from 5 to 8 per cent, but usually the full 8 per cent is allowed. Flour manufactured from local wheat is entitled to a very favorable rail rate, which is a decided advantage for interior shipments.

[The flour trade of the Johannesburg (South Africa) district was reviewed by Consul Edwin N. Gunsaulus in Daily Consular and Trade Reports on Feb. 15, 1912, and an article by Consul George A. Chamberlain, of Lourenco Marquez, published Mar. 12, covered the flour situation in Mozambique Province, Portuguese East Africa.]

### NEW SOUTH AFRICAN FOOTWEAR FACTORY.

[From Consul Nathaniel B. Stewart, Durban, Natal.]

A concern, under the name of the Union Boot Manufacturing Co., of South Africa (Ltd.), with a capital of \$73,000, has been formed to establish a factory in Pietermaritzburg for all classes of footwear. The promoters of the enterprise estimate that a dividend may be expected in three or four years. The delay will be due to the necessity for procuring suitable buildings and then importing the proper machinery from Europe and America. American manufacturers of boot-making machinery might find it advantageous to get in touch with the secretary of the recently organized company.

The total value of boots and shoes imported into British South Africa during 1911, according to customs figures, was \$5,709,962, and the value of those imported through Natal was \$1,138,858.

## INCREASED AMERICAN PURCHASES FROM JAPAN.

[By Consul General Thomas Sammons, Yokohama.]

There was an increase of nearly \$1,000,000 in the value of merchandise invoiced through the three American consulates in Japan—Kobe, Nagasaki, and Yokohama—and the consulates at Dalny, Manchuria, and Tamsui, Formosa, to the United States last year compared with 1910. These exports were valued at \$73,729,760, in addition to which \$3,528,961 represented charges on the goods at the various ports.

Of the total exports last year from the five consular districts named, the consulate general at Yokohama and its agency at Hakodate certified shipments amounting to \$61,978,430, consisting principally of raw and waste silk, copper, linen and silk goods, tea, peanuts, plants and bulbs, cotton goods, toys, and sulphur. The shipments from Kobe and its agency at Yokkaichi were valued at \$11,529,446, and consisted principally of metals, straw mattings and braids, brushes, bamboo and wood ware, tea, rice, and porcelain and earthenware. Those from Formosa were made up principally of Oolong tea and camphor; from Tamsui, graphite; and from Dalny, soya bean oil.

## Exports to United States.

The following table gives the articles and their value invoiced through the five American consular districts to the United States for 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Antimony ware.....	\$63,800	\$66,918	Mineral water.....	\$1,596	\$2,785
Awabi, etc.....	25,608	19,294	Mushrooms.....	43,974	41,640
Bamboo and bamboo wares.....	260,824	355,101	Paper.....	97,716	120,719
Bean oil.....	93,974	88,486	Paper goods.....	110,384	134,076
Books.....	35,120	40,857	Peanuts.....	274,634	291,292
Braids, chip and straw.....	1,201,905	962,800	Peppermint oil and crystals.....	74,626	140,023
Brushes.....	571,394	578,747	Personal and household effects.....	60,500	30,153
Camphor and camphor oil.....	1,403,928	1,066,850	Plants, bulbs, etc.....	238,604	241,572
Carpets and rugs.....	237,720	50,394	Porcelain and earthenware.....	1,162,707	1,117,696
Chilies, ginger, etc.....	57,357	78,547	Provisions.....	842,486	1,119,741
Coal, coke, and charcoal.....	190,061	2,880	Rice.....	452,117	520,842
Copper.....	2,153,349	2,013,197	Sake.....	117,332	123,902
Cotton and cotton goods.....	374,303	455,927	Shoyu.....	138,726	131,030
Curios.....	432,453	327,793	Silk goods.....	2,907,675	2,845,732
Fans.....	66,601	90,924	Silk, raw and waste.....	43,516,126	43,648,340
Furniture, screens, etc.....	55,672	55,145	Straw matting.....	1,545,168	1,319,993
Glassware.....	17,978	3,527	Sulphur.....	469,732	361,357

Metals and metal wares.....	1,000,234	1,720,852			
			Total.....	72,522,344	73,729,760

## Shipments to American Insular Possessions.

The total value of the shipments to the Philippine Islands last year was \$3,524,500, against \$2,686,833 for 1910, and to Hawaii, \$2,273,641 and \$2,163,525, for the two years, respectively. Included in the total exports credited for the Philippine Islands were articles valued at \$87,074 from Yokohama destined for Guam, and consisting

principally of rice, provisions, cotton and silk goods, and porcelain. The following table shows the articles declared from the five consulates to Hawaii and the Philippines during 1910 and 1911, including charges on same:

Articles.	Hawaiian Islands.		Philippine Islands.	
	1910	1911	1910	1911
Antimony ware.....	\$460	\$361	\$453	\$888
Awabl.....	8,292	4,661	2,557	4,011
Bamboo and bamboo ware.....	15,548	21,960	10,846	12,524
Books.....	10,543	13,771	5,912	2,239
Brids, chip and straw.....	946	1,610	42,813	40,570

### COAL MONOPOLY PROPOSED FOR ICELAND.

[From Chargé d'Affaires, American Legation, Copenhagen, Denmark.]

According to Isafold, a biweekly published at Reykjavik, the Althing (the local legislature of Iceland) has appointed a committee which is to prepare a plan for obtaining new sources of national revenue. The Althing especially charged the committee to devote attention to the advisability of establishing a monopoly on the import and sale of tobacco, coal, and petroleum.

Of these the coal monopoly is considered most important. The imports of coal into Iceland are said to be constantly growing, mainly due to the increased number of steam vessels fishing along the coasts, partly Icelandic and partly foreign vessels. Last year about 80,000 tons of coal were imported, and it is thought the amount will be greater next year. About half the coal imported is said to be used by foreign steamers. It is estimated that the revenue from a monopoly on coal would amount to about 100,000 crowns (\$26,800) from coal sold to foreign vessels alone.

**FOREIGN WAREHOUSES FOR AMERICAN GOODS.**

[From Consul Robert T. Crane, Rosario, Argentina.]

Investigations undertaken in response to an inquiry relative to the establishment of distributing stations and warehouses in connection with sales agencies for American products in South America and the existence of such facilities at present have disclosed that there are no enterprises of this character in Rosario nor anywhere in Argentina, and what was at first a feeling of distrust in the success of such a project has been changed into a confident belief in its entire feasibility.

The chief difficulties now appear to me to be not at this end but in the United States. The plan as outlined was simply one of warehousing at a point more convenient than the factories for a certain district and shipping out on orders received from, or rather through, the local sales agents of the manufacturers.

**Local Difficulties for Solution.**

Rosario is without doubt the best point in Argentina at which to locate a central depot, but there are several factors in the local situation which offer difficulties for solution. The most serious is that in this port, as in others of the Republic, the port privileges are granted to a private company for a long term of years. Among these privileges is that of warehousing all goods while within certain port limits, and there are no bonded warehouses in Argentina outside of these limits. On inquiry I am informed that it is unlikely that the privilege of bonding warehouses beyond the port limits would be granted, and yet there is, I am told, a possibility that such a concession might be made. Assuming that none can be obtained, however, there remain but two alternatives—to erect warehouses within the port concession, or to pay the duties and abstract the goods at once from the custody of the port company and of the customs authorities.

The concession of the water front at Rosario for 14 miles has been granted to a French enterprise, La Sociedad Anonima del Puerto del Rosario, which has expended about \$10,000,000 in improvements. The privilege of erecting warehouses within its confines depends not only upon the company but also upon the Federal authorities. Tentative inquiries lead me to suppose that there would be no opposition on the part of either, the sole question being one of compensation to the port company.

If the manufacturer were to pay the customs duties and remove goods from the port immediately, it is unlikely that any goods once shipped to Argentina would be sent elsewhere on account of the distances. The payment of the duty upon landing will only, therefore, lay upon the merchandise the additional burden of carrying the amount of the duty during such time as it remains warehoused. On some lines this would constitute a heavy charge, but on many others it would be extremely small; much of the agricultural machinery, for example, the most important of American exports to Argentina, is free of duty or pays about 5 per cent ad valorem.

**Features of the Agricultural-Implement Trade.**

As the trade in agricultural implements is the best organized here, and therefore in one way the least in need of the facilities under discussion, it is to it that I have gone chiefly for a test of the proposition. The agents for agricultural machinery have excellent facilities of their own in the shape of main depots and subsidiary deposi-

tories throughout the cultivated area of the country, and their methods of handling are up to date. Their feeling toward a warehouse under other management for the lines in which they deal is not on the whole favorable, and is, I believe, due solely to the feeling that such a company might undertake to sell as well as to store and ship.

.. If a supply can be maintained close at hand, the local dealer must inevitably draw upon it. The members of a firm here, which sells many thousand plows in a year, tell me that they are obliged to order in lots of 500 or 1,000, because they can not afford to meet drafts at 30 days' sight on larger consignments. The result is that, owing to irregular delivery, they are at times for months without a plow on hand; at the present moment they are unable to deliver a plow, although they have made sales of over 1,300. In all lines I am told there are frequently long periods when no delivery can be made on account of such interruptions to the steady supply of goods in small lots from the United States.

#### **Success of Plan Rests with American Manufacturers.**

But is there any possibility of inducing American exporters to carry a stock at such a distance? For those American manufacturers who seek only an occasional market abroad the scheme is obviously of no value, for they can not positively count upon the sale of their goods after arrival. For those manufacturers, on the other hand, who enjoy a regular market here for their products, who intend to maintain it by devoting to it the necessary portion of their output year by year, who intend, in short, to treat it as they would a home market, such facilities would be just as obviously of high value. But what proportion of the manufacturers of the United States are willing to deal with foreign markets as they are in the habit of dealing with their home markets? Fortunately or unfortunately there are a few of them so pressed for an outlet for their products as to be forced to view the export trade with the same intense seriousness of purpose that they put into their domestic business.

In spite of certain difficulties, then, it appears unquestionable that an enterprise of this nature would irresistibly attract the local merchants to a degree sufficient to insure its success, and would facilitate trade with the United States.

---

### **HUNGARIAN STATE AID TO INDUSTRIES.**

[From report of British consul at Budapest.]

Ten factories were established in 1911 with State assistance, and the further development of 15 others was assured; these establishments represent \$3,248,000 capital, and give employment to at least 3,700 workmen. In addition, 36 factories received machinery to the value of nearly \$100,000 on condition of employing 1,150 new workmen. Some 67 factories received State assistance in the form of freedom from taxes, etc. In the case of 20 factories exemption from taxation was prolonged, and a similar privilege was granted in favor of 19 factories, the erection of which is contemplated. In all, State aid to industry during 1911 represents \$9,135,000, and has given employment to 7,700 workmen. A good deal has been done by the Government to encourage the smaller industries. Machinery has been granted to the value of \$18,000, and an experimental institution has been established for making experiments and examining materials likely to develop the smaller industries. The Minister of Commerce is also engaged in studying methods of reducing distress among the working classes. Further, the development of the use of water power in Hungary is engaging the attention of the authorities, and the work of the commission occupied in considering a reform of the industry law "Gewerbe Gesetz" is stated to have made progress.

**CANADIAN PURE-FOOD PROCEDURE.**

[From Consul Felix S. S. Johnson, Kingston, Ontario.]

Certain provisions concerning the adulteration of foods were added to the Canadian inland-revenue act in 1868 as an amendment and passed. As this was the foundation of all later acts a summary of the provisions may be interesting.

Analysts were appointed in Halifax, Montreal, London (Ontario), St. Johns, Toronto, and Quebec. The inland-revenue officers were to collect samples of goods suspected to be adulterated and submit them to the analysts. On receiving a certificate that these suspicions were well founded they were to seize and destroy the goods. The analysts were to report quarterly to the Minister of Inland Revenue at Ottawa, who was to present the results to Parliament annually. Dealers were obliged to give samples whenever requested, and the penalty for selling adulterated food was \$100 on the first conviction and \$200 for a subsequent offense. A manufacturer was to be fined \$100 for a first offense and upon a second conviction was liable to six months' imprisonment.

The adulteration act of 1884 is in force to-day. It was amended in 1888, 1890, 1896, and 1900, but the changes were comparatively unimportant, being principally definitions. The new act provided for the appointment of a chief analyst, who was to be attached to the staff of the Inland-Revenue Department at Ottawa. He was to be a final arbitrator whenever a question arose as to the correctness of any analyses made by a local analyst. He was to supervise generally the work of the laboratory of inland revenue and prepare from time to time bulletins setting forth the results of the collection of samples. These were to be issued to the public and contain the names of the vendors from whom the inspectors obtained samples, as well as names of manufacturers when possible. The exact condition of each article examined was to be shown, together with the opinion of the analyst regarding the purity and fitness for the purpose for which it was sold. In all, 231 of these bulletins have been issued in 27 years.

**Fines—Warranties of Purity—Standards.**

When adulteration is found, the procedure is similar to the English practice. The Minister of Inland Revenue, acting on information, may order a collection of the articles suspected to be adulterated, and these samples are bought and paid for in the usual way by inland-revenue inspectors. If they are found to be adulterated under the meaning of the act, the seller is obliged to pay a sum ranging from \$8 to \$14 to cover the cost of the analyses. This is not a fine, and has to be paid in any event. The fact being thus established, the Government may bring an action in the ordinary courts of the district in which the adulterated goods were sold. If the action is successful, the fine is \$5 to \$200 for a first offense, and a fine or imprisonment, or both, for a subsequent conviction.

In 1898 an amendment provided the retail dealer with an additional safeguard in the form of warranty of purity. If the vender can produce this, the action is shifted to the giver of the warranty, but the warranty does not relieve the retailer from paying the costs of analyses.

A clause provides for fixing standards of purity. These may be established by the Governor General in council at any time and have the force of law at the expiration of 30 days. The chief analyst prepared a complete set of provisional standards and submitted them to the manufacturers and importers for criticism and approval. Some of these have since become law by an order of the Governor General in council; they cover milk and milk products (1910), grain products (1911), meats (1910), and beverages (1911). Others covering baking powder, flavoring extracts, jams, and cream of tartar are in course of preparation.

### SENDING TRAVELERS TO VENEZUELA.

[From Consul Thomas W. Voetter, La Guaira.]

A New York firm makes inquiry as to whether it would be advisable to follow up its catalogue campaign with a special traveler, carrying a full line of samples.

In reply I can do no better than quote from a letter recently received from the American consular agent at Ciudad Bolivar, a Venezuelan port on the Orinoco River. This agent is a member of one of the leading mercantile firms in that section and is conversant with the needs of the trade as well as the needs of the people and their conditions. He states:

There is no doubt that this is an ever-increasing market for American goods, but the manufacturers must fight for it. Year after year European manufacturers send out their traveling agents with a line of samples. Very few Americans come here \* \* \*. In some cases the styles, designs, or quality would have to be changed to suit the different districts of Venezuela, but a live man would soon catch on. A line of goods that would sell well in all Venezuela is American hardware, locks, and tools, much more so if they are light, as duties are collected on the weight (groes), and if prices compare favorably with the heavier English goods.

From the above extract concerns in the United States may judge that one merchant would be very glad to welcome American travelers with samples. I would advise that the Orinoco Valley be not neglected in any campaign in this country, as not only are the needs of a large section of the country supplied through it, but the southeastern part of Colombia as well, due to the navigability of the Apure, one of the western branches of the Orinoco.

If the expense of sending a traveler seems great, he might also represent other American manufacturers at the same time, preferably those who manufacture allied but not competing lines, such as saws, axes, edged tools and such a line of hardware as would be adapted to an agricultural or stock-raising country.

With the high price of coffee the people have more money at their disposal than in former years, and imports are increasing, the present would not be a bad time to make an earnest effort to get a share of this increased trade.

### Bound Volumes of Daily Consular and Trade Reports.

The Government Printing Office will supply regularly in quarterly volumes, with complete 32-page indexes, bound sets of Daily Consular and Trade Reports from January 1, 1912. The price is \$1.50 per volume or \$6 per year, in order to cover the cost of the index and binding. Those desiring the bound volumes should write to the Superintendent of Documents, Government Printing Office, Washington, D. C.

**CREDITS FOR RUSSIAN TOWNS AND ZEMSTVOS.**

[From Consul General John H. Snodgrass, Moscow.]

There is now pending in the Duma a bill regarding credits for towns and zemstvos. [For an article relative to Russian zemstvos see Consular and Trade Reports dated Apr. 2, 1910.] It has been proposed to allow credit in two ways: Through the assistance of a Government cash office for municipal credit and by loans of money from land banks granted without mortgage security.

The foundation (reserve), as well as the floating (working) capital, of the cash office, amounting to \$5,000,000 each, is to be deposited by the Government treasury, not in cash but in bonds or stocks. Loans will be made by bonds of short as well as of long duration, the total amount issued not to exceed \$50,000,000 (ten times the amount of the foundation capital). Loans for a long period are granted only for those constructions and improvements which require the investment of a large sum of money exceeding the usual means of the towns and zemstvos, such as canalization, waterworks, roads, etc. Short-term loans may be negotiated to meet current expenses.

The question of credit for towns and zemstvos has been thoroughly discussed by the press. The necessity for the organization of municipal credit is universally recognized; there is difference of opinion only in regard to the methods. The best system is considered to be that of mutual credit, to which preference has been given by a majority of the Russian towns and zemstvos that planned the organization of a Russian Society of Mutual Credit. This system would have the advantage of bearing a communal character, and not a bureaucratic one. The towns and zemstvos would be independent in the distribution of credit for their local needs, which would not be the case with a Government cash office.

**The Pros and Cons of the Plan.**

In the discussion which has attended the consideration of this subject it has been pointed out that in granting long-time loans a Government cash office would investigate not only the financial position of the town or zemstvo, but also the extent of the necessity or utility of the construction in question. Therefore the operations of the towns and zemstvos would come under the control of the cash office, or rather under the control of the Minister of Finance, to whom the cash office will be subordinated.

In the planned organization of a mutual credit society it was proposed that the association should have the right of issuing bonds. As opposed to this it is shown how important it is for the Minister of Finance to keep the right of issuing bonds in his own hands for the regulation of the money market and the course of Russian notes; but it is claimed that in the issuance of bonds the minister must of necessity give more consideration to financial conditions and to the state of the Government treasury than to the requirements of the towns and zemstvos seeking loans. If it would be required at the same time to issue bonds for the towns and zemstvos and for other purposes (such as Government loans, railways, etc.), preference would always be given to the latter.

Lastly, the limitation of credit operations to \$50,000,000 does not meet the requirements of the towns and zemstvos to their full

extent. There are about 50 Government zemstvos in Russia and as many large towns. Therefore the credit for each of them is limited to \$500,000, while the expenses of some towns regarding such public utilities as waterworks, tramways, canalization, etc., would necessitate the loan of several million dollars. It is evident, therefore, that a credit of \$50,000,000 will prove insufficient to meet the requirements of the larger towns, while there are, besides, the district zemstvos and the smaller towns still more in need of credit.

#### **Land-Bank Loans without Mortgage Security.**

The Government feels that the establishment of a cash office along the above lines does not solve the question of credit for towns and zemstvos, and therefore has prepared another project, according to which private land banks would have the right of making long-term loans without mortgage security. This considerably extends the scope of credit and alleviates the situation.

Unless the limitation of credit operations be increased, it will be necessary for the provincial cities to look to outsiders for assistance in floating their loans for municipal improvements. A number of the mayors have written this office requesting to be placed in communication with American financiers who might be induced to underwrite their proposed loans.

---

*Russian credit banks.*—Supplementing his report on mutual credit banks in the Russian Far East that appeared in Daily Consular and Trade Reports on January 27, Consul John F. Jewell, of Vladivostok, has forwarded copies (in Russian) of the by-laws of the Vladivostok Society of Limited Mutual Credit and of the Vladivostok Commercial Society of Mutual Credit. These pamphlets are on file in the Bureau of Manufactures.

---

#### **NEW FRANCO-JAPANESE BANK.**

[From American Ambassador Charles Page Bryan, Tokyo.]

Negotiations for organizing the Franco-Japanese bank [noted in Daily Consular and Trade Reports for Apr. 17] have practically been concluded, and Mr. Soyeda, president of the Industrial Bank of Japan, is leaving for Paris to arrange the details of the contract and articles of association.

The organization will be in the nature of a syndicate, the Japanese shares to be held by the Industrial Bank, and the French by the Société Générale, Banque de Paris, Comptoir National d'Escompte, Crédit Foncier, and l'Union Parisienne.

The syndicate will be capitalized at \$5,000,000, the Japanese putting up \$2,000,000 and the French \$3,000,000. The head office will be located in Paris and the branch in Tokyo. The business of the branch bank will probably be conducted by the Industrial Bank. The Parisian banks will keep a specie deposit in the Tokyo office.

The new organization will carry on an ordinary banking business, including exchange and loans. It will also have the power to issue debentures and act as promoter in various kinds of enterprises. Its fundamental purpose is to facilitate the introduction of French capital in the industrial development of Japan.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8898. Wood handles and hardware.**—An American consular officer in the United Kingdom reports that a resident of his district has expressed a desire to obtain agencies for American makers of wood handles of all descriptions and for manufacturers of hardware.
- No. 8899. Machinery for rubbing or polishing stone.**—A firm in England engaged in stone quarrying has informed an American consulate that it would be very much interested in any improved machinery for rubbing or polishing stone. Correspondence should be sent direct to the firm.
- No. 8900. Woolen and cotton materials for ladies' blouses and robes.**—A report from an American consular officer states that a manufacturer's agent in his district desires to enter into negotiations for the purpose of obtaining agencies for American printers of woolen and cotton materials suitable for the making of ladies' blouses and robes. The inquirer states that he has first-class connections with important buyers of these materials and is already doing a large trade for several important Continental manufacturers. References will be furnished.
- No. 8901. Raw asbestos and asbestos rings and packing.**—An American consul in the United Kingdom reports that a firm in his district manufacturing asbestos desires to receive quotations on raw asbestos. Another firm of asbestos merchants desires to purchase asbestos rings and packing.
- No. 8902. Telephone equipment.**—The American consulate general at Sydney, Australia, has forwarded copies of tender forms, specifications, etc., covering various telephone supplies, such as switchboards, associated apparatus, etc., issued by the Postmaster General's Department of the Commonwealth of Australia. Copies of the papers referred to will be loaned to interested firms by the Bureau of Manufactures. All the tenders covering these supplies close July 31, 1912.
- No. 8903. Shoes, hides, cotton goods, kitchen utensils, etc.**—The Bureau of Manufactures is in receipt of a communication from a business firm in the United States inclosing a letter from a firm in Turkey requesting to be placed in communication with shippers of the following articles: Hides and skins, boots and shoes, cotton goods, kitchen utensils, and any other article which could be advantageously used in that country. The foreign correspondent furnishes references.
- No. 8904. Dredging.**—The American consulate general at Ottawa, Canada, reports that the Department of Public Works has advertised for bids, to be received until June 4, 1912, for dredging required in Toronto Harbor, Ontario, and Miami Bay, New Brunswick. Combined specification and form of tender can be obtained on application to the secretary of the Department of Public Works, Ottawa. Dredges and tugs not owned and registered in Canada can not be employed in performing the work.
- No. 8905. Machinery and tools.**—An American consular officer in a European country reports that the manager of a firm in his district has expressed a desire to be put in communication with some competent American manufacturers of machinery and tools with a view to representing such firms. This firm is said to be in good standing and the manager is energetic and will probably be able to do good business for manufacturers in the above-mentioned lines.
- No. 8906. Waterworks material.**—The American consulate general at Vancouver, British Columbia, reports that tenders will be received by the City Clerk, Vernon, British Columbia, until June 10, 1912, for supplying 17,000 feet of 4-inch cast-iron pipe and 10,500 feet of 6-inch cast-iron pipe; also 125 gate valves and 36 hydrants ranging in size from 4 inches to 8 inches. Specifications can be obtained from the City Engineer's Office, City Hall, Vernon, British Columbia, Canada.
- No. 8907. Rubber.**—An American concern owning two large rubber plantations in the Straits Settlements desires connections with crude rubber buyers in the United States.

## TARIFF SYSTEM OF PERU.

[By Commercial Agent Frank R. Rutter.]

### Customs Tariff.

The present customs tariff of Peru, which became effective July 1, 1910, prescribes specific rates of duty for nearly all imports. It replaced a schedule of ad valorem duties, assessed on fixed official valuations. In effect, the old tariff was equivalent to one of specific duties in the case of all articles included in the schedule of official valuations, but for a considerable number of articles no official valuations were provided. The simplification of the system which resulted from eliminating the unnecessary list of official valuations was in response to a general demand on the part of the importers, and is in accord with the general tendency in South American tariff legislation. While on certain articles the rates of duty were lowered, the general effect of the revision was to increase the rates. The average ad valorem duty on all imports in 1908 was 21.4 per cent, in 1909, 24.2 per cent, and during the first six months of 1910, 21 per cent, as compared with 25.4 per cent for the last half of 1910 under the new tariff. In 1911 the customs receipts show a gain of more than 20 per cent over 1910, but the statistics of importation have not yet been published. Returns for Iquitos, which was not subject to the regular schedule of import duties until October, 1910, have been excluded from the foregoing comparisons.

### Additional Charges.

Although not mentioned in the new tariff law, the surtax of 8 per cent of the duties, prescribed by law of November 18, 1892, is still in force at all ports of the Republic. Imports at Callao, Salaverry, and Paita are subject to a further surtax of 2 per cent of the duties for municipal funds. The proceeds from the 2 per cent surtax at the three ports are not included in the customs receipts. One-half of the amount collected at Callao is by law of January 8, 1896, destined for the water supply and sewerage of that port, and, when sufficient funds for that purpose have been collected, may be used for paving, by virtue of the law of August 22, 1907; the other half is turned over to Lima, according to the law of September 30, 1903, to

pay for a municipal theater. The amount collected at Salaverry, by virtue of the law of October 26, 1906, is to be used for the water supply and sewerage of Trujillo, and that collected at Paita,<sup>1</sup> by law of November 16, 1906, for the public works of Piura. The 8 per cent surtax is, on the contrary, included in the customs receipts and in the averages quoted above. This surtax, which has now been in force nearly 20 years, is destined for the payment of interest on the national debt.

#### Landing Charges.

At Callao the docks were constructed by a French company known as the Empresa del Muelle y Dársena. By a contract entered into with the Peruvian Government May 5, 1887, this company was granted exclusive control of the loading and discharge of cargo for a period of 25 years. For discharging cargo from vessels, whether lying at the dock or anchored in the harbor, the company charges a fee of 2.42 soles<sup>2</sup> per ton; for certain articles this fee is collected by weight (per ton of 1,000 kilos), while for other articles it is collected by measurement (per cubic meter). In the case of a few articles specific rates are charged in lieu of the ordinary fee for discharging. The contract with the dock company has been modified from time to time, and unless a new contract is made, the monopolistic feature will expire in May, 1912. Thereafter steamship companies and importers, in the absence of a new contract, will have the legal right to disembark cargoes at their own expense, but unless new public docks are built or those owned by the company are purchased by the Government, the general right to perform the service of loading or unloading merchandise will not be of practical utility to shippers or importers.

At most of the other Peruvian ports the docks are similarly owned by private companies. In all cases, however, the schedules of charges have been approved by the Government and compare favorably with those in force in other countries on the west coast of South America.

#### Warehousing.

The customs warehouses at Callao are, since January 1, 1911, under the direct control of the customhouse. No charge whatever is made on articles entered for consumption within eight days after landing.<sup>3</sup> Beyond that free period, the charge for warehousing in the case of dutiable imports is 1 per cent of the ordinary duties for the first 30 days (which need not coincide with the calendar month) and two-thirds of 1 per cent for each additional month. On articles free of duty the warehouse charge is 5 centavos per 100 kilos for the first 30 days and 3 centavos for each subsequent month. After three years goods not claimed by the consignees are sold at public auction, the proceeds above the amounts due to the customs being subject to the order of the consignee.

Preliminary to warehousing an inventory is made of the contents of each package, for which a fee of 5 soles is collected. If a consignment consists of a number of similar packages the fee of 5 soles is

<sup>1</sup> In the case of Paita, fiber for straw hats (paja toquilla) is exempt from the 2 per cent surtax.

<sup>2</sup> In the Peruvian monetary system the pound = 10 soles = \$4.8665; sol = 100 centavos. Kilo = 2.2046 pounds avoirdupois. Meter = 39.37 inches.

<sup>3</sup> The extension of the period during which no charge is made for warehousing to 30 days in the case of imports in ships of the Peruvian Steamship Co., in return for an annual payment of 600 pounds, was granted by decree of Feb. 28, 1912, in effect Mar. 1. (Boletín de Aduanas, Mar. 9, 1912, p. 173.)

charged only for one package, and 20 centavos for each of the remaining packages in the consignment.

Warehouses are also maintained at Mollendo, Paita, and Iquitos, where the same charges are in force as at Callao. At those ports, however, the maximum period of storage is fixed at two years.

Special warehouses for cereals at Bellavista, about 2½ miles from the docks at Callao, and for explosives at San Lorenzo, an island in the harbor of Callao, are maintained, both under control of the National Salt Co. The inconvenient location of the former and the poor facilities at the latter are criticized in the report of the general superintendent of the customhouse of Callao for 1911.

#### **Dutiable Weight—Packing.**

Duty is levied in the case of certain articles on gross weight, in the case of other articles on "legal weight," which includes the immediate container but not the outer receptacle, and, when no other method is indicated in the tariff, on net weight. For articles dutiable by gross weight and, to a less extent, articles dutiable by legal weight, care must be exercised to minimize the weight of the packing as far as is consistent with safe carriage. At the same time, it must be continually borne in mind that shipments are subject to rough handling; transshipment is often necessary; and for large regions in the interior the only means of transportation is the pack animal. To preserve and increase trade with Peru it is essential that consignments arrive in good condition and, to this end, the instructions of the purchaser in respect to packing must be followed literally. If too heavy cases are used, the importer incurs unnecessarily heavy import duties; if too light, the goods are liable to be damaged. The same considerations apply even in respect to articles dutiable by net weight. For unless either the importer or the customs authorities demand the actual weighing of the goods after the removal of the packing, the duties are levied on the gross weight, with a fixed allowance for tare, according to the kind of packing employed.

Containers are liable to duty separately only when of an unusual kind or when dutiable at a higher rate than the contents. When the same package contains goods dutiable by gross weight and also goods dutiable on some other basis or at some different rate, the actual weight of the former, including their own immediate containers and the proportionate amount of packing (sawdust, excelsior, etc.) is increased generally 25 per cent, while in the case of bedsteads and pianos an increase of 60 per cent is provided for.

#### **Dutiable Value.**

While the great majority of articles specified in the tariff are liable to specific rates of duty, for some 20 or 25 articles *ad valorem* rates of duty are provided. Articles not specified in the tariff and not capable of assimilation to articles so specified are subject to a duty of 30 per cent "of their wholesale value at the customhouse. The value will be determined by means of the original invoices or any other information available to the customs office. This duty shall be of a provisional character until the specific rate applicable has been established." (Customs law, art. 51.) In actual practice, lists of prices, based in part on the former schedule of valuations and in part on invoice values of similar articles previously imported, are kept on file by the customs authorities and are used as a check on the values

declared in the invoice. The same rule is followed in determining the basis for calculating the few *ad valorem* duties prescribed in the tariff, with the exception of patent medicines, on which the duty is 25 per cent of the list price. In regard to new patent medicines, not named in catalogues, the duty is based on the invoice price.

#### **Classification of Articles.**

Articles not specifically named in the tariff, when composed of more than one material, are classified under the material liable to the higher rate of duty. The original determination of the rate of duty applicable to an importation is made by a customs inspector, known as the *vista*, from whose decision appeal may be taken first to the General Superintendent of Customs, then to the Board of Customs (*Junta de Arancel*), composed in part of representative business men not connected with the customs service, and finally to the Minister of the Treasury. In law an appeal from the Minister of the Treasury to the courts is provided for, but in practice the decision of the minister is final. Each decision in respect to classification has the force of law and is communicated to the other customhouses, so as to prevent variations in practice.

As an example of the procedure followed, the case of lard substitutes may be cited. While not specifically named in the tariff, lard substitutes had for many years prior to September, 1910, been classified as lard. The Superintendent of Customs then decided that only pure lard was entitled to the low rate of duty provided for "lard" and that lard substitutes were dutiable at 30 per cent *ad valorem*. His decision was reversed by the Board of Customs, but was reaffirmed by the Minister of the Treasury. The result was to cut off the importation of lard substitutes. The determination of the chemical composition of shipments presented for importation became necessary. To avoid the delay of the chemical analysis of lard on its arrival in Peru, an official certificate from the United States Department of Agriculture should be obtained and should be viséed by a Peruvian consul. [The Bureau of Manufactures has been informed that the certificate accompanying shipments of lard may be viséed by the Peruvian consul in the United States or by the United States consul in Peru, at the option of those interested.] This is especially important in the case of shipments to the smaller ports, where no chemical laboratory is maintained, and from which, in the absence of an official certificate, samples must be sent to Callao for analysis.

#### **Revision of the New Tariff.**

The new tariff, as has been pointed out, met the desires of importers in replacing by simple specific duties the system of *ad valorem* duties calculated on officially assessed values which had been in force ever since the colonial period. The effort was made to fix the duties on as large a number of articles as was possible—many more than had previously been included in the schedule of valuations—and in making such a complete revision of the tariff some ambiguities could scarcely be avoided. By decree of April 19, 1911, a commission was designated, composed of representatives of the customs service, chambers of commerce, and prominent importers, to recommend necessary changes in the customs tariff. After a few months of careful study the commission made its report. While no new tariff

based on these recommendations has yet been submitted by the Government to Congress, a new edition of the current measure, with explanatory notes, was authorized on January 4, 1912.

#### **Commercial Travelers and Samples.**

Since December 31, 1910, samples of merchandise when possessing intrinsic value must pay the ordinary duties specified in the tariff, which are not refunded on the reexportation of the samples. Prior to that date bonds were accepted and were canceled upon proof that the samples had been shipped out of the country. It was claimed that in some instances articles of inferior value had been substituted for those originally introduced, and to prevent such abuse the privilege of temporary admission was withdrawn. The result of the present practice, from which it is said some specific exceptions have been made, is to render extremely difficult and expensive the canvassing of the Peruvian market. If the salesman wishes to show samples of his merchandise, he must either lose the whole of the duties he has paid or else dispose of his samples to local dealers before leaving the country. The latter alternative is rendered less desirable because Peru is situated halfway up the west coast, and is therefore not a convenient place to terminate a journey.

There is no national tax on commercial travelers, but local taxes are imposed by some towns and districts. Thus in Arequipa a fee of about \$12 quarterly is required.

#### **Imports by Mail.**

Articles imported by parcel post are naturally subject to the customs duties and surtaxes, but avoid the charges of the dock companies and the commissions exacted by customs brokers. Advertising matter when imported in bulk is subject to duty, but catalogues mailed in single copies are admitted free. A rebate of one-fourth of the ordinary duties is allowed on advertising novelties if not salable and if containing prominently and indelibly an advertising notice.

#### **Internal Revenue and Monopolies.**

The collection of internal-revenue taxes is intrusted to the *Compañía Nacional de Recaudación*, a private corporation, which turns over the proceeds, less a fixed allowance for expenses and a small commission, to the Government. The same company also operates the opium monopoly and the recently instituted tobacco monopoly, but the salt monopoly is distinct. The importation of articles subject to monopoly is prohibited on the part of private persons. Playing cards, alcohol and alcoholic beverages, matches, and sugar are liable to internal-revenue taxes in addition to the customs duties. Municipal and provincial taxes are not applicable to imports arriving direct from foreign countries.

#### **Export Duties.**

The only articles subject to export duties in Peru are crude silver, straw hats shipped from Paita, and all kinds of rubber or similar gums. In 1910 these duties produced about 5 per cent of the total customs receipts. Practically the whole amount was collected at Iquitos and Mollendo. On July 1, 1911, a rate of 8 per cent ad valorem on

rubber and other gums went into effect, but no statistics showing the proceeds at Iquitos, the principal rubber port, are yet available for 1911.

#### Customs Practice at Callao.

It may be of interest to describe briefly the various steps incident to entering merchandise for consumption.<sup>1</sup> As soon as the incoming ship has satisfied the requirements of the health officer and the captain of the port, a customs inspector examines the manifest and supervises the discharge of the merchandise. Packages in bad condition are inventoried by customs officers and representatives of the steamship company jointly. In case any package named in the manifest is missing, the steamship company is held responsible and must pay the corresponding duties, if the package is one of a uniform consignment, or if not, a fine of 100 soles. When a package is not included in the manifest, a supplementary declaration is required on paper bearing a 5-sol stamp.

The discharge of the cargo is made by the dock company. Packages containing machinery, heavy packages, and articles free of duty may be dispatched directly from the dock; others are conveyed to the provisional warehouses, where they are held for eight days without charge, pending the application of the importer for their entry for consumption or deposit in the permanent warehouses. In the absence of such application within the specified period an inventory of the contents is made at a cost of 5 soles per package, or in the case of a uniform shipment, 5 soles for the first and 20 centavos for each remaining package. When an inventory is made at the request of the importer, the fee is 1 sol for each package weighing not more than 99 kilos and 2.50 soles for each package of greater weight. As soon as merchandise has been examined and classified it is transferred to the warehouse of goods for immediate consumption, and if not removed by the owner within 48 hours (exclusive of holidays) is liable to three times the ordinary charge for storage.

For goods deposited in the general warehouses a warrant is issued by the customs, specifying in detail the contents and the duties. The warrant is transferable upon notice to the customs. Goods may remain in the general warehouses at Callao for three years, but after that term are sold at public auction. When goods are consigned to order the consular invoice or the bill of lading must be presented, and in all cases the receipt of the steamship company and of the dock company is required to prove the payment of the freight and of the unloading charge. There are at present no bonded customs agents at Callao and goods may be entered directly by the importer. There is, however, no provision for transportation in bond, except for goods in transit to Bolivia, and goods, even when consigned to importers living in the interior, must be entered at the ports by agents of the importers.

Articles misbranded are not excluded from importation into Peru, but must pay the duty corresponding to the article named on the label if higher than that to which the substance itself would be liable.

<sup>1</sup> This account is based chiefly on an interview with Mr. Felipe Derteano, Chief of the Division of Clearances (Director de Despacho) in the Callao customhouse, supplemented by a memorandum prepared by Mr. Derteano.

## TRADE IN MALTA.

[By Consul James Oliver Laing, Valetta.]

The depression in the trade of Malta which has been noticeable in the last four or five years continued during the fiscal year 1910-11. One of the causes of this depression is the reduction of the British naval and military establishments in the islands, the number of men connected with the warships alone having declined from 18,000 or 19,000 to about 8,500. This and the change in the army causes a total loss in trade of about \$1,450,000 annually. Unless this trade is brought back to Malta it is likely that the depression will continue.

The island of Malta itself has a civil population of 190,741 and an estimated acreage of 46,602. Some 41,800 acres are under cultivation, but much of this is poor land which would not be cultivated in the United States, and which produces rather poor crops, although good crops are raised on the better ground. The other large island of the Maltese group, Gozo, has a population of 22,654.

Owing to a change in the method of keeping the trade statistics, no comparison of last year's trade with that of the year before is possible. The trade with various foreign countries for the fiscal year 1910-11 is shown herewith and for the sake of comparison that for the last six months of 1909-10:

Countries.	Imported from—		Exported to—	
	Last six months 1909-10.	1910-11	Last six months 1909-10.	1910-11

## Trade in American Goods.

American goods imported into Malta during the fiscal year 1910-11 amounted to \$280,378, the principal items being fish, \$6,521; flour and semola, \$17,791; lard, \$57,711; meats, \$1,829; cottonseed oil, \$91,261; petroleum, \$69,712, and unmanufactured tobacco, \$29,150. These figures, however, are not representative of the true imports of American goods, as shipments here are credited to the country of the port from which they enter Malta. Thus cottonseed oil made in the United States and sent here via Naples is credited to Italy. There are in reality probably \$600,000 worth of American produce imported annually, many American manufactures being purchased by English and Continental merchants, who resell them here. A

hundred or more articles are to be seen in the shop windows, which are readily recognized as of American manufacture.

Aside from bullion and specie and the materials used on shipboard, the imports are largely made up of foodstuffs and wearing apparel. The following list shows the value of the principal articles:

Articles.	Last six months 1909-10.	1910-11	Articles.	Last six months 1909-10.	1910-11
Beer.....	\$104,103	\$196,470	Meats.....	\$140,427	\$325,091
Biscuits.....	15,319	33,758	Metal manufactures.....	173,323	498,586

#### Domestic Produce and Other Goods Exported.

The chief articles of export produced on the islands are cheese, cumin seed, potatoes, hides and skins, and tobacco manufactures. The value of the principal articles of domestic produce and of other goods exported in the periods mentioned were as follows:

Articles.	Last six months 1909-10.		1910-11	
	Domestic produce.	Other produce.	Domestic produce.	Other produce.
Bran.....			\$36,225	
Bullion and specie.....		\$472,488		\$866,786
Cheese.....	\$25,091	7,323	31,924	10,467
Cinematograph films.....		26,220		169,067
Coal, coke, and patent fuel.....		\$23,737		1,804,537
Cotton (raw).....	36,664		21,583	57
Cumin seed.....	51,166		109,077	
Potatoes.....	62,914	759	329,130	1,068
Flour and semola.....	22,424	257	36,896	461
Hides and skins.....	47,092		92,015	693
Live stock.....	5,644	10,628	12,870	10,190
Metal, old.....	133,468		82,676	
Fallow.....	7,197		24,439	
Textile manufactures.....	26,196	8,214	53,083	32,479
Tobacco manufactures.....	36,770	11,397	96,833	10,380
All other articles.....	2,270	140,198	98,524	340,650
Total.....	452,346	1,501,261	1,015,196	3,186,681

The amounts of the articles given in the table of exports as going to the United States are not accurate, as many goods are shipped there by way of other ports, to which they are credited in the statistics.

Invoice records of this consulate show that in the fiscal year 1910-11 lace goods valued at \$439 were exported to the United States, \$666 to Manila, and \$161 to the Canal Zone, and tobacco valued at \$152 and cumin seed at \$1,582 were shipped to the United States. Lace goods are usually shipped by parcel post.

Vessels entering Malta in the year 1910-11 numbered 3,059 of 4,337,736 tons. Of these 1,026 of 2,399,939 tons were British, 787 of 313,924 tons Italian, 397 of 890,793 tons German, and 508 of 393,698 tons Austrian.

### AUSTRALIAN COMMERCIAL NOTES.

[From Consul General John P. Bray, Sydney.]

#### San Francisco-Australian Mail Line.

The agent in Sydney of the Oceanic Steamship Co. (Spreckels Line), of San Francisco, notifies this consulate:

I have a cable from Messrs. Spreckels instructing me to officially announce the first departure of the Oceanic steamers from San Francisco on July 2 next, and the first departure from Sydney on the 27th of the same month.

In accordance with the above I have notified the consular officers in Australia of the contemplated renewal of the mail service between Sydney and San Francisco.

#### Big Shipping Tonnage.

The shipping tonnage at Sydney Harbor is steadily increasing. It is probable that the record for daily arrivals at this port was broken on April 1 when 9 big over-sea and 10 interstate steamers, representing 80,964 tons of shipping, arrived. In view of the increase proposed by big over-sea companies in the tonnage of vessels, some of which will be up to 18,000 tons, it is probable that this record will soon be exceeded. There were also in the harbor on April 3 more than 40 other vessels of a tonnage of 130,399, exclusive of warships, New Zealand, and interstate boats.

#### Australia-New Zealand Cable.

A tender has been accepted by the Pacific Cable Board for laying a direct cable line to Auckland, New Zealand (as indicated in Daily Consular and Trade Reports for Jan. 22, 1912), and it is anticipated that the cable will be in operation before the end of 1912. The line will be laid from a point near the Sydney Heads to Nuriwai, New Zealand.

#### Australian Wines.

At the Australian Royal Agricultural Show at Sydney, which closed in April, the exhibit of native wines was particularly noteworthy. For a number of years the wine industry and the quality of Australian wines have been steadily improving. This year experts agree that the quality of the wines is the best ever exhibited at the royal show. The Herald, in commenting upon this, laments the fact that Australia is a spirit, instead of wine, drinking country. It attributes the fact to the influence of English customs upon the people, as it points out that Australia is climatically a wine-growing and a wine-drinking country. It compares Australia to the southern countries of Europe, and hopes and recommends that the people here will follow the example of the people there and make light wines a national drink, and points out that great advantage will accrue from this financially by encouraging a valuable home industry, and physically and morally to the benefit of the people. There seems, however, to be no prospect of such a change in the immediate future.

**PINE LANDS OF NICARAGUA.**

[From Consul Arthur J. Clare, Bluefields.]

The pine belts on the Atlantic coast of Nicaragua extend north from the Rio Grande along the 84th meridian, west longitude, following the coast line into Honduras, and vary in width from 10 to 30 miles. This territory is traversed by the Walpasixa, Prinzapulka, Kukallaya, Wawa, Sisín, Awastara, and Wanks Rivers and incloses the lagoons of Pahara, Twappi, and Beymona.

All the above-named rivers are navigable, but bars across their mouths prevent large vessels from entering, and navigation at present is carried on by gasoline boats, canoes, and "pitpans." The latter are large, built-up canoes capable of holding several tons of freight each.

The land for a few miles on each side of the rivers mentioned is a dense jungle, where malogany cutting is now carried on, log rafts being easily floated downstream. Inside from these jungles and around the lagoons the pine lands extend, and to obtain the best results railroads must be built to carry out the logs or sawed lumber.

**Sawmills in Operation and Openings for More.**

A few years ago a sawmill was in operation on the Wawa River, but it failed and was allowed to go to ruin. Another at Rio Grande was sold some years ago, but has never resumed operation owing to lack of capital for cutting and bringing out logs. The mill at the Rio Grande Bar is sawing up lumber for 50 per cent of the logs brought down. One at Pearl Lagoon is showing satisfactory results, but is not cutting pine (that place being out of the pine belt)—only cabinet and hardwoods. At Cape Gracias a Dios another mill is sawing pine and has been in operation for some years.

Owing to the high prices of lumber, dressed or undressed, there is no reason why a good company should not succeed in operating several mills, in combination with shingle mills and a sash and door factory, on this coast. The best locations are on the Wawa River and the Pahara Lagoon. On the Wawa the old mill site could be used, and on the Pahara Lagoon logs can be brought from all parts of the surrounding country. Dakura, Pahara, Awastara, Krukira, Twappi, etc., can all be reached by water from there. If this lagoon were connected with the Wawa River by railroad, the line would pass through some excellent timber. The climate is very healthful.

At present two or more companies are distilling turpentine in Honduras with satisfactory results. Nicaragua offers equal facilities for this industry, as the pine contains a large percentage of resins and oils.

**Land for Lease or Purchase—Grazing and Coconut Planting.**

There are several pine properties for sale on this coast, but as the land is very poor for agricultural purposes, being a sand and gravel composition, it is recommended that prospective mill operators lease the timber rights from the Government, as such a lease can be had at moderate cost, either so much per log or per hectare (2.47 acres) of land. If any operator would prefer to buy the land outright from the Government, he can do so at 4.50 soles (about \$1.90 gold) per hectare, and to this must be added the expenses for titles and surveying.

The only use to which this land can be put is for grazing or for planting coconuts. Cattle do quite well and are not molested by tigers in the open country, but it requires at least two acres to support each animal. Coconuts bring a good price and are an excellent investment.

It takes, however, five to six years after planting before they come into bearing, but each tree will then bear about 200 nuts yearly. The trees are usually planted 30 feet apart, and when young must be protected from cattle, which will eat the tender leaves.

### NOTES FROM ASIATIC RUSSIA.

[By Consul John F. Jewell, Vladivostok.]

#### **New Wireless Stations—Trans-Siberian Schedule Reduced.**

It has been proposed that the Duma shall provide \$515,000 for building radiotelegraph stations along the Kara and White Seas to insure telegraphic communication between northern and western Siberia with western Europe via the Arctic Ocean.

During the coming summer the time of the express trains on the Trans-Siberian road will be considerably shortened. The time of the express trains from Moscow to Vladivostok will be 8 days 17 hours 35 minutes, and from Vladivostok to Moscow 8 days 11 hours 35 minutes; from St. Petersburg to Vladivostok, 9 days 2 hours, and from Vladivostok to St. Petersburg, 9 days 4 hours 40 minutes. The time of the ordinary passenger trains from Moscow to Vladivostok will be 12½ days and from Vladivostok to Moscow 11½ days. It is thought that by next year a further reduction in the running time of 24 hours will be made. The Minister of Ways and Communications hopes before many years to provide a 6-day train from Vladivostok to St. Petersburg.

#### **Navigation of Amur—Oil Exploitation.**

The Chief of the Waterway Control has informed Amur shipowners that foreign ocean-going steamers will be permitted to go up the river as far as Mago, 40 miles above Nikolaiefsk. This regulation is likely to have an influence concerning the loading of beans and other bulk cargo, as at Mago loading can be done much cheaper and more quickly than at Nikolaiefsk.

A general meeting took place in Vladivostok recently of the participants in the Sakhalin Oil Co., who have signed an agreement with a representative of a group of French capitalists who have subscribed \$1,030,000 capital for exploiting the Sakhalin oil fields. It is reported that toward the end of May an expedition will be sent to Sakhalin to examine the fields, for which \$100,000 has been put aside.

#### **Investigations and Studies.**

According to an imperial order, the following sums were put at the disposal of N. L. Gondatti as president of the Amur Expedition:

For the study of districts adjoining Mongolia and Manchuria, \$10,300; for soil and botanical study in the Yakutsk-Vilinsk district, \$13,000; Yakutsk-Ust Maya, \$12,360; Yakutsk-Nelkon-Ayan, \$5,330; sources of the Angara River, \$10,660; sources of the Vitim River, \$7,800; Troitskoevsk County, \$18,575; and for agronomical and meteorological work in the Amur Province, \$40,170, and for the Maritime Province, \$6,865.

A Norwegian expedition headed by Erian Ulsen, a scholar of Christiania University, intends starting soon to study the flora and fauna and the natives inhabiting northern and middle Asia. The route to be followed is from Omsk, Siberia, by the River Irtysh to Semipalatinsk, and from the mouth of the Irtysh back to the Mongolian frontier. In 1913 this expedition intends to visit Krasnoyarsk, Irkutsk, go north along the banks of the Yenisee River to Cape Tolstoi, and return to Norway via the Arctic Ocean.

**NEW ELECTROPLATING PROCESS.**

[From Consul Horace Lee Washington, Liverpool, England.]

Following an inquiry from the United States as to a new method by which any firm material may be plated with copper, interviews were had with the leading copper merchants, smelters, and manufacturers in the Liverpool district, but in no case had any of them heard of such a process. A copper plater, however, stated that he thought it possible the American inquirer might have reference to a process recently described in Chambers Journal, and from this article the following extracts have been taken:

An ingenious invention which is illimitable in its applications has been perfected by two Italian chemists. Briefly described, it comprises a means of depositing metals of any character upon any insoluble surface by electrical energy. The results so far achieved promise to revolutionize the whole art of electroplating and decoration as well as many other branches of industry. China, wood, glass, celluloid, paper, and other substances which have hitherto been regarded as beyond the electroplater's craft are coated as easily as the metals generally associated with this process. What is more, the plating is everlasting. It enters into the fabric treated so that it becomes an integral part of the article. Thus, for instance, if an attempt is made to chip the plating from a glass vase the glass will come away with its metal coating.

**Method Has Extended the Plater's Art.**

There is a wedgwood tea service on exhibition which shines with the true luster of polished silver. The outer surface is so well covered with this metallic armor that the whole resembles a silver set. It is only when the interior is examined and the pottery beneath is observed that one realizes that the silver had been deposited upon the external surface. What is more, the outer sheathing is not a thin film but a solid sheet of metal which can be made of any thickness and capable of being worked by the engraver. The authorities have expressed their willingness to apply the hall mark to articles so mounted. The process is likely to supersede the present process of silver mounting cut glass and other articles. Instead of the metallic adornment being attached by means of plaster of Paris, which is simply a makeshift, the metal deposited upon the glass becomes part and parcel of the article.

The process has extended the electroplater's art to a considerable degree. Any metal and its alloys can be electrically deposited upon some other metal as a base. Zinc, tin, and lead can be deposited as easily as silver or nickel. This fact is of vital interest to a host of industries, as is borne out by the action of one of the largest builders of naval vessels, who has adopted the process for the zinc and tin plating or galvanizing of the steel parts of the boats. The deposit is not so thin, as in ordinary galvanizing, that a pin scratch will penetrate the protective skin, but is a solid sheathing of metal associated with the other metal beneath.

The possibility of being able to plate wooden articles seems so remote as to be fantastic, yet it is as efficiently accomplished by the Marino process as if copper were being plated. So far as china plating is concerned the article must be in the unglazed or biscuit condition, and is first coated with a chemical agent. In the same manner glass which is to be treated must first be roughened by sand-blasting to remove the polish and to enable the metal to secure a grip. Another point is that the deposit, no matter what the character of the base, may subsequently be oxidized, lacquered, etc., in just the same way as ordinary electrowork.

**Its Interest to the Housewife.**

To the housewife the process is of far-reaching value. It will strengthen the articles in common use and make them more hygienic, as they can be scoured and cleaned to greater advantage. She will be able to use aluminum more extensively than heretofore. By the Marino process the interior of an aluminum saucepan or coffeepot can be given a coating of tin which permits the use of soda and acid cleansing mediums with impunity, whereas such methods upon the pure aluminum bring about its early destruction. The possibility of being able to deposit a protective coating upon aluminum, and thus save it from oxidation, will popularize the use of this metal in industries where, although it is urgently required by reason of its lightness, it is viewed with disfavor owing to its rapid corroding.

**NEW GOVERNMENT PUBLICATIONS.**

[Announcement of Superintendent of Documents, Government Printing Office, Washington, D. C.]

**Scenic Wonders.**

The Department of the Interior has begun the publication of a series of profusely illustrated pamphlets descriptive of the great national parks in the West and the natural wonders which they inclose. Three numbers have been thus far issued, namely: (1) Geological History of the Yellowstone National Park; (2) Geological History of Crater Lake, Crater Lake National Park; (3) Geysers.

These are not technical treatises. While they give much scientific information, it is not given in technical terms. The purpose of the publications is to popularize the parks, of which there are now 14. The Superintendent of Documents has these interesting and ornamental pamphlets for sale at 10 cents each.

**Government Standard for Cement.**

Circular 33, Bureau of Standards, Commerce and Labor Department, issued May 1, 1912, has for title "United States Government Specification for Portland Cement."

This specification is the result of a Government inquiry by a board on which all Government departments were represented. This board conferred with representative unofficial consumers and manufacturers and with special committees of engineer societies. The specification given in Circular 33 was unanimously adopted by all departments of the Government at a departmental conference February 13, 1912, and by an Executive order issued April 30, 1912, it was directed that all cement used in Government work shall conform to this specification. Circular 33 is sold by the Superintendent of Documents at 10 cents a copy.

**A New Legal Work, Beginning a Series.**

Edwin M. Borchardt, law librarian of the Library of Congress, is the author of a work entitled "Guide to the Law and Legal Literature of Germany," which has been published by the Library and is sold by the Superintendent of Documents, Government Printing Office, Washington, D. C., at 65 cents in cloth binding. It is hoped and intended to issue hereafter similar treatises on the laws of European countries.

The commercial and social relations of citizens of the United States with the principal European countries, already extensive, are so sure to be much more extended in the near future that a knowledge of the general principles of their systems of law, such as Mr. Borchardt's manual gives for Germany, would seem to be a desideratum for many American interests, both individual and corporate.

**Federal Antitrust Decisions.**

In 1907 the Department of Justice published in two volumes Federal Antitrust Decisions, 1890-1906. This year these two volumes have been reprinted, with two more, giving the trust cases to the present date, with tables of cases reported and cases cited and an index-digest to the whole, making a set of four volumes, bound in buckram, and sold by the Superintendent of Documents at \$4 for the set.

**Everglades of Florida.**

A very complete collection of all the acts, reports, and other papers, State and National, relating to the Everglades and their reclamation, has been published by the Government as Senate Document 89, Sixty-second Congress, first session. Besides 208 pages of text, the document carries two large folded maps and several plates and diagrams. Copies are for sale by the Superintendent of Documents, Washington, D. C., at 20 cents.

**Interesting to Coin Collectors.**

The Bureau of the Mint has lately published an illustrated volume (634 pages text and 16 pages plates) entitled "Catalogue of Coins, Tokens, and Medals in the Numismatic Collection of the Mint of the United States at Philadelphia, Pa."

The importance of the mint's coin collection, known hitherto but to few, is now made clear to the many, and it is certainly a remarkable collection. While it is especially strong, if not absolutely complete, in the field of American coins, tokens, and medals, it holds also many coins of the ancients, and early coins of other American and European countries. Its descriptions are full and exact and the general make-up and outlook of the book pleasing. The Superintendent of Documents, Government Printing office, Washington, D. C., sells the catalogue for \$1.

**THE CASSAVA INDUSTRY IN JAMAICA.**

[From Consul Julius D. Dreher, Port Antonio.]

Although an effort three years ago by Americans to build up a cassava industry in Jamaica proved unsuccessful, it is announced that another attempt is about to be made to grow cassava on a large scale.

The American promoters [address obtainable from the Bureau of Manufactures] have acquired a large tract of land in the parish of Trelawny on which coconut trees will be set out at regular intervals on the same ground with the cassava plants. As the work progresses it is proposed to build a factory for manufacturing the cassava tubers into various products, but chiefly starch, for exportation to the United States. Of the exports of cassava starch from Jamaica in 1910, amounting to \$7,947, the United Kingdom took \$6,363 and the United States only \$817; and of \$660 worth of cassava wafers exported, the United States took \$519, or 80 per cent.

Cassava, which is also known as "manioc," a corruption of the name of the genus "*Manihot*," is cultivated extensively in the West Indies, in South America, and in Africa, where it forms a staple article of diet. In Jamaica cassava ranks third among the "ground provisions" which are the principal articles of food among the natives, yams coming first and potatoes second. Both kinds of cassava are grown in Jamaica, the sweet cassava (*Manihot aipi*) and the bitter cassava (*Manihot utilitissima*), both being prolific bearers of farinaceous tubers usually 8 to 10 inches in length and 1 to 3 inches in diameter. The tubers of the sweet cassava are eaten as a vegetable like yams and potatoes. The bitter cassava contains an acrid, poisonous, milky juice, which has to be removed by pressure after the tubers have been washed, scraped, and grated. Bitter cassava is extensively used to make starch for local use and in making "bammies," a sort of cake much used as a substitute for bread in the southern and western parts of the island. There is a cassava factory in the parish of Clarendon which manufactures a variety of products, such as starch, flour, tapioca, breakfast foods, cakes, wafers, cassareep, sauces, etc. Cassava wafers are rightly regarded as a great delicacy, especially by tourists to Jamaica.

The imports of cassava and tapioca into the United States during the fiscal year 1911 aggregated 60,915,112 pounds, having an average unit invoice value of 2.3 cents per pound. [They enter free of duty—B. of M.]

---

**Jersey Island Potatoes in England.**

Vice Consul James Fisher reports the opening of the new potato season at Hull, England, about three weeks earlier than usual. The first direct potato cargo steamer arrived from St. Malo on May 13 with over 7,000 packages, some 2,000 being retained by Hull dealers, the balance going inland. Good Jersey potatoes are retailing in Hull at 4 to 5 cents per pound.

---

The Siamese Ministry of Finance has been sending three students to Europe annually to take a five-year course in finance, but the Minister has decided to increase the number to eight and to prolong the course to eight years.

**VIOLIN MAKING IN GERMANY.**

[From Consular Agent W. Bruce Wallace, Markneukirchen, supplementing articles in Daily Consular and Trade Reports for May 7, 1910, and Jan. 7, 1911.]

Violin boxes, until a few years ago, were made here entirely by hand and their manufacture, with but few exceptions, was a house industry. Since 1907 it has been possible to manufacture the body by machinery. A stock company of several of the large exporters having been formed, it bought the patents and erected a large factory. The original purpose of this concern was to furnish the dealers with a violin body, here called "schachtel," or box, that would be as cheap as those made in Bohemia and with the advantage of being made of seasoned wood and each body being exactly the same. Now, however, through improvement in machinery, they are also able to manufacture the violin finished for the market.

It is stated that attempts have been made to import the violin bodies into the United States for finishing. Because of the cheapness of the house-industry violin, however, the Markneukirchen dealer was able to undersell in the United States notwithstanding the 45 per cent duty.

A large amount of sheep gut is imported into this district, for manufacturing strings, from almost all sheep-growing countries, except the United States.

---

**TRADE PROSPECTS IN SOUTH AFRICA.**

[From Consul E. A. Wakefield, Port Elizabeth, Cape Province.]

From present indications the volume of trade for this consular district for 1912 will show a decided increase both in imports and exports over the preceding year. Exports valued at \$508,724 (126 invoices) were sent from Port Elizabeth to the United States during the quarter ended March 31, as against \$464,300 (91 invoices) during the same period in 1911 and \$359,700 (66 invoices) in 1910.

Imports for the first two months of 1912 totaled \$7,450,250 and in 1911 \$6,609,879, or an increase of \$840,000. The combined imports for this consular district (Port Elizabeth and East London) for January and February, 1912, were \$11,158,873, an increase of \$1,681,000 over the same period last year. These figures are significant as indicating the increasing commercial importance of this district. No other South African port shows such an increase.

While English manufactures have by far the greater portion of this trade, American manufactures are being imported in quantities which compare very favorably with the increased bulk of trade.

---

**RETAIL TRADE DELIVERIES BY MOTOR.**

[From the London Times.]

At the annual meeting of the Civil Service Cooperative Society, held at the Stores, Haymarket, London, on May 13, President J. T. Helby stated that their country business was largely increasing, and the society now delivered within a circuit of 50 miles of London. It used to be a practice for their customers to go to the stores to make their purchases, and in many cases took them away in their own carriages, but they were now leaving London in large numbers, and expected their goods to be delivered at the same prices and with the same dispatch as if they still resided in town. Nevertheless, the town delivery, as far as the number of parcels was concerned, showed no decrease, but the parcels were smaller and of less value. During the past year the society delivered 571,781 parcels.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

**No. 8908. Revolvers of cheap quality.**—An American consular officer reports that a firm in his district desires to be placed in communication with an American manufacturer of revolvers of a cheap quality. There is a large demand in the country in question for cheap revolvers, which are at present supplied by European manufacturers. Satisfactory references will be furnished. Correspondence in English, French, or Italian.

**No. 8909. Refined sulphur.**—A business man in a European country informs an American consular officer that he has important buyers of refined sulphur for industrial purposes, for reexport to divers markets abroad. A description of sulphur produced in the United States, which appeared in a recent issue of a local newspaper, was brought to his attention and he is desirous of being placed in connection with sellers of this product. It is his intention to do business as an agent against a fixed commission previously arranged, the buyers of the sulphur being first class in every respect.

**No. 8910. Textile machinery and textile goods.**—A report from an American consulate states that a commission agent in a part of a European country where the manufacture of textile goods is flourishing would like to hear from manufacturers of textile machinery and supplies who desire a representative for the district. He would also consider an agency for any textile goods that have a prospect of success.

**No. 8911. Library furnishings.**—An American consul has forwarded a report on library furnishings which will be required to carry out a plan for the collection of certain historical and other documents relating to a certain foreign country. The undertaking will include the preparation of the building, equipment with shelves, furnishings such as chairs, tables, desks, writing materials, stationery, etc. Copy of the complete report and plans which accompanied it can be obtained from the Bureau of Manufactures.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

**No. 664. Dredging.**—Sealed proposals for dredging Rouge River, Mich., will be received at the United States Engineer Office, 337 Federal Building, Detroit, Mich., until June 28, 1912. Information on application to C. McD. Townsend, Colonel, Engineers.

**No. 665. Subsistence stores, etc.**—Sealed proposals will be received by the medical officer in command, United States Marine Hospital, Pittsburgh, Pa., until June 4, 1912, for furnishing subsistence stores, etc., required at the hospital during the fiscal year ending June 30, 1913, in accordance with a list of articles and specifications, copy of which may be had on application to the officer named.

**No. 666. Brick storehouse.**—Sealed proposals will be received at the United States Engineer Office, 920 Seventeenth Street, N.W., Washington, D. C., until June 12, 1912, for furnishing materials and erecting complete, a brick storehouse on Potomac Park. Information on application to W. C. Langfitt, Lieutenant Colonel, Engineers.

**No. 667. Dummy armament and fire-control stations.**—Sealed proposals for the installation of dummy armament, fire-control stations and accessories in the projected armory of the Eighth Coast Artillery district, New York City, will be received at the United States Engineer Office, Room 707, Army Building, New York, N. Y., until June 4, 1912. Information on application to S. W. Roessler, Colonel, Engineers.

**No. 668. Cable.**—Sealed proposals, in duplicate, will be received at the office of the Chief Signal Officer, War Department, Washington, D. C., until June 10 for furnishing the Signal Corps with various quantities and types of cable required. Specifications and particulars can be obtained from the office named. (Proposal No. 590.)

## ENGLISH WOOLEN AND WORSTED INDUSTRIES.

[By Consul Augustus E. Ingram, Bradford.]

While conditions in the woolen and worsted industries of the West Riding district of England were better last year than for 1909, there was a decline in the trade compared with 1910. There were marked difficulties throughout the year, due to industrial disturbances at home, unsettled political conditions in a number of foreign countries, tariff legislation in Japan, the uncertainty as to tariff revision in the United States, and the high price of wool.

This decline in the woolen and worsted trade, however, was not seriously felt owing to the diversity in the business of the district. Indeed, the leading business men stated that the past two and one-half years have been probably the most prosperous in the history of the district. As a Yorkshire publication remarked, in part:

The interdependence of interests is not so close that when one branch suffers the rest suffer with it. In fact, interests in some cases are diametrically opposed, so that what is lost by one section is gained by another. While the dress-goods manufacturers enjoyed less than a fair share of fortune's favor last year, due to the unusually hot summer, the same cause operated in favor of the cotton-goods trade, and Bradford cottons had a record year.

The building trade, which is said to be the most sensitive industry, the first to feel depression, and the last to recover, seems to have enjoyed a good year. A fair number of new dwellings were erected in the district, while there was considerable activity in the erection and enlargement of mills and factories.

### Exports to the United States.

The declared value of the merchandise invoiced at the Bradford consulate for shipment to the United States during 1911 showed a decrease of \$3,720,330 compared with 1910 (accounted for chiefly in the items of raw wool, stuff dress goods and linings, and textile machinery). Of the total shipments of wool to the United States from the Bradford district last year, amounting to 10,454,757 pounds, valued at \$2,443,012, British wool represented 3,852,305 pounds, valued at \$945,867, and colonial and foreign wool 6,602,452 pounds, valued at \$1,497,146.

The articles and their value for 1910 and 1911 are given in the following table:

Articles.	1910	1911	Articles.	1910	1911
Alpaca hair.....	\$63,798	\$47,379	Rice flour.....	\$6,825	\$1,721
Automobile accessories.....	2,407	308	Rubber manufactures.....	2,780	3,226
Camel's hair, tops and noils.....	111	1,345	Sheepskins, pickled.....	447,555	526,204
Card clothing.....	64,286	62,682	Silk goods:		
Carpets and rugs.....	48,931	79,517	Silk and silk and cotton piece goods.....	1,964	4,846
Chemicals.....	2,379	2,096	Silk seals, plushes, etc.....	13,631	9,235
Cotton cloths:			Silk noils and waste.....	89,183	192,549
Dress goods.....	605,629	619,628	Spindle bands.....	10,511	10,585
Linings.....	1,407,227	1,547,299	Stuffs:		
Cotton waste.....	8,644	5,952	Dress goods.....	2,084,476	1,247,368
Craped wool, hair, etc.....	63,538	35,999	Linings.....	1,661,870	933,873
Groase, etc.....	25,515	20,329	Tape, braid, etc.....	7,077	3,847
Hair cloths.....	797	7,989	Tapestry, damasks, etc.....	11,343	13,565
Hemp bagging, etc.....	3,406	3,438	Wire (iron, steel, etc.).....	482,813	362,971
Household effects.....	5,986	3,674	Wool:		
Jute waste.....	16,737	63,331	British.....	2,126,633	948,867
Leather, and manufactures of:			Colonial, etc.....	2,007,724	1,407,145
Butts, bends, etc.....	157,950	189,119	Wool waste.....	5,006	3,582
Belting, manufactured.....	5,469	9,912	Woolen cloths.....	101,469	18,624
Linens.....	1,617	515	Worsted coatings.....	728,106	435,089
Machinery.....	1,208,261	515,639	Yarns:		
Mohair (goat's hair).....	140,220	70,166	Silk.....	962,245	1,234,274
Noils.....	16,203	95,636	Cotton.....	284,148	118,653
Paper.....	31,439	14,226	Worsted and mohair.....	10,319	15,346
Plants.....	2,318	376	Other.....	6,653	126
Rags (new woolen clip-pings).....	75,630	12,450	All other articles.....	7,097	9,367
			Total.....	15,016,483	11,296,153

The exports to the Philippine Islands were valued at \$14,326, against \$18,007 for 1910, and consisted principally of cotton linings and noils. Stuff dress goods amounting to \$316 worth were the only exports to Porto Rico, and there were no shipments to Hawaii.

#### Prices and Wool Supplies.

First and foremost of all industries in Bradford is wool. It is stated that four-fifths of the wool manufacturing of Great Britain is carried on in the West Riding of Yorkshire. There were but slight fluctuations in the price of the raw material. One report gave the price of merino wool at the close of the year as only 5 per cent lower, and crossbred 5 to 7½ per cent lower than for the same period 12 months previous. This was remarkable in view of the fact that the imports from Australasia, South Africa, and South America were some 150,000 bales in excess of 1910, and that the market had practically had no support from the United States, and at times the Continent showed weakness. It indicates conclusively that the consumption of wool is steadily on the increase, a fact that the American woolgrowers should bear in mind. The latest available statistics estimate that the world's sheep stocks have only increased from 522,584,083 in 1895 to 582,722,789, or 11 per cent, while the world's wool-using population increased in the same period from 520,336,225 to 635,457,578, or 22 per cent.

At the London wool sales in January, 1911, though there had previously been a strong "bear" movement made at Roubaix and Antwerp, prices were maintained. Prices at the March sales were aided by the heavy consumption needed to complete Japanese orders before the imposition of the new import duties on textiles in that country. In September prices began to decline, but at the London

November and December sales there was a reaction and prices hardened, in part due to the purchases for the United States.

In regard to merinos, one report stated that a feature of the demand for these wools during the year was—

the keenness with which really fine-haired parcels were sought after. Year by year the supply of these grades is becoming more limited, so many of the Australian growers having turned their attention to the production of a larger and heavier fleece of a rougher quality than formerly. This change has given the South African farmers their opportunity, of which many of them have quickly availed themselves, and of recent years by careful selection and breeding they have effected a vast improvement in the quality of the wool.

The more progressive growers are also paying more attention to the classing and skirting of their fleeces. Crossbreds, and especially those light shrinking wools most favored by the United States, suffered most owing to the absence of American purchasers.

#### **Mohair Industry—Trade in Wool Tops and Noils.**

In spite of the fine weather during the summer of last year, conditions in the mohair industry were unsatisfactory. It is stated that the competition of other bright materials made of luster wools, and particularly mercerized cotton, has had a serious effect on the sale of mohair goods. The exports of mohair (goat's hair) to the United States last year decreased to nearly half the quantity for 1910.

Wool combing or top making, and the trade in this prepared wool, are among the most important industries of the district. The export trade of tops has greatly developed in recent years, the shipments from the United Kingdom in 1900 being 28,031,200 pounds; 1905, 35,386,300 pounds; and 1910, 42,129,400 pounds. The exports last year, however, decreased to 38,145,400 pounds. Germany takes the largest share of these tops, followed by Japan, Sweden, Italy, Belgium, and other continental countries. There are no shipments to the United States. The bounty granted by the Australian Government to the top-making industry of that country is having its effect on the Bradford industry, as the Australian shipments to Japan are increasing.

The total exports of noils from the United Kingdom last year were 17,073,000 pounds, a slight decrease compared with 1910. In wool waste the exports reached the record total of 12,592,500 pounds. The shipments of noils from the district to the United States in 1911 showed a marked increase over the previous year, cashmere noils and cardings forming a large part of the exports.

#### **Shipments of Woolen and Worsted Yarns.**

The output of woolen and worsted yarn last year is said to have been one of the best. Spinners of botany yarns were busy throughout the year and the consumption of hosiery yarns was phenomenal, owing to the popularity of knitted coats, jerseys, etc. Mohair yarns suffered, the prevailing fashions not being favorable to their consumption, and moreover artificial silk is proving a serious competitor.

The total exports of worsted yarns from the United Kingdom were 59,621,900 pounds, of which Germany took 35,642,400 pounds. Woolen yarns reached a total shipment of 5,751,700 pounds, while in mohair and alpaca yarn, out of a total export of 15,992,100 pounds, there were sent to Germany 11,669,800 pounds. The exports of wool or hair yarn not enumerated also amounted to 9,638,700 pounds,

making an aggregate total of 91,004,400 pounds of yarn exported from the country. The exports of worsted and mohair yarns to the United States from this district, amounting to \$15,346, consisted mostly of fancy yarns.

#### **Cotton Spinning.**

Cotton yarns are largely consumed in this district, being used not only for Venetians, poplins, waterproofing cloths, mercerized fabrics, and voiles composed of cotton and artificial silk, but also for warps in cotton coatings, linings, and other wool cloths. The cotton-spinning and doubling industry in Yorkshire is overshadowed by its proximity to Lancashire and by the importance of the worsted industry of the West Riding. The number of cotton spindles in Yorkshire is in excess of 2,500,000, as compared with 3,500,000 of worsted spindles, and approximately 1,500,000 of the carded woolen trade. The preponderance of these Yorkshire cotton spindles are, however, "doublers" or consumers of single yarn from Lancashire. It is said that the spinning range includes both American and Egyptian cotton and extends to 120s counts. The export of cotton yarns from this district to the United States last year amounted to \$418,863, the largest total recorded. These yarns were mostly mercerized and of fine counts.

#### **Shipments of Silk Noils and Waste.**

The outstanding feature of the year in the silk-spinning trade, which is so largely carried on in Bradford and the neighboring town of Brighouse, was the high range of values. The United States was the largest customer. The exports to all countries of silk noils and waste from the district last year were valued at \$1,234,274 against \$962,345 for 1910. Those to the United States were \$192,549 and \$89,183 for the two years, respectively. The increase in the shipments of silk noils and waste to the United States last year was due to the decision of the customs authorities that silk noils from cocoons or from waste silk should be classified as silk partly manufactured and be dutiable on entrance to the United States at 35 cents per pound instead of as silk waste free of duty. It is stated that American manufacturers had been importing these noils in order to produce a woolen cloth with a raised face, soft handle, and silken luster, suitable for overcoatings. The difficulty at the customhouse is said to have arisen from some firms importing "noils" of such a length as to resemble drafts suitable for spinning, and consequently a limit of length, 2 inches, has been placed on silk noils to be free of duty. Shippers claim that this length is prohibitory, and shipments have now practically ceased.

#### **The "Hobble" Skirt and the Dress Goods Trade.**

The greatest adverse influence in the dress-goods trade during last year was the "hobble" skirt fashion. Not only did it greatly reduce the demand for dress material, but it also cut off a large portion of the underskirt, petticoat, and lining trade. The small quantity of material in these narrow skirts also allows a heavy fabric to be worn without the weight becoming unduly burdensome. The long knitted coats so much worn recently by women have also injuriously affected the dress-goods trade, though benefiting the soft knitting-yarn trade.

While stuff goods are the principal production in Bradford, great developments have been made in the manufacture of high-class cotton goods, notably heavy cotton poplins, gaberdines, etc., and of fancy cotton and artificial-silk fabrics.

**Decreased Exports of Worsted Coatings to United States—Cheviots.**

The worsted coating trade enjoyed a good year, but owing to high prices of raw material and increased manufacturing expenses it is said that profits were small. Corkscrews, used for morning coats, have apparently gone out of fashion, the popular cloths now being the plain and fancy twills. The passing of the frock coat and the black morning coat, which is so marked especially in England, has also seriously affected the sale of trouserings. The exports of worsted coatings to the United States during 1911 decreased \$293,017 in value compared with 1910, but the shipments of late years are insignificant compared with the years 1895, 1892, and 1889, when the shipments to the United States amounted, respectively, to \$8,561,228, \$5,302,701, and \$6,564,304.

A feature of the year was the use for women's cloaks or mantles of thick cheviots, double faced, with contrasting and often brilliant color effects. These reversible cloths were originally made in Batley and the Colne Valley, but they are now being tried in worsteds. They are said to be favored by the makers, as no linings are necessary. Being practically a double cloth, they are proportionately dearer.

**Trade in Cloth Caps, Cloths for Cravenetting, etc.**

It is said that the manufacture of cloth caps, which are now so extensively worn in the United Kingdom, consumes a large amount of material consisting mostly of woollen tweeds. Some local manufacturers now specialize in producing cloths for this purpose. These caps are made larger than formerly, and instead of retailing at 13 to 42 cents each the price is now 36 to 60 cents each.

The output of warp-faced cloths for cravenetting—the so-called gaberdines—is said to have been large, as these are used for men's and women's raincoats, which have become so popular. The over-coating trade suffered by the competition of these cravenette cloths. The increased use of automobiles has been responsible for a large increase in fabrics known as proofings, and also in cotton linings used in the manufacture of rubberized cloths for the hoods of vehicles.

The bright goods manufacturers did not have a good year. "Permos" (made from the best wool and mohair) were rather neglected, and the American trade in Sicilians was small. Heavy-weight mohairs, such as are used for summer coats, waiters' jackets, etc., are always a staple article, and the same kind of material is now also being used for dust cloaks and rugs for motorists.

**Use of Artificial Silk—Popularizing British Fabrics.**

There was a good trade in cotton and artificial silk fancies, tasteful designs in striped voiles and all-over effects being produced. Nothing has been more striking than the progress made in the use of artificial silk, and now that the difficulties in producing even yarn and in finishing the woven fabric have been gradually overcome, artificial silk is a most important feature in the manufactures of this district. Large

quantities of these cotton-warp and artificial-silk web fabrics are made not only in Bradford, but also in Bingley, Keighley, etc. They are chiefly made for the export trade. Many of these light fabrics are not piece dyed but merely finished. An artificial-silk plant is being established in Bradford, and possibly before long the demand for these yarns may be supplied locally.

Silk goods also form an important branch of the Bradford trade. The silk goods woven in Lancashire, like the cotton fabrics, are sent to Bradford to be dyed and finished. Of the 22 firms in England engaged in silk spinning, 14 are in Yorkshire, mostly at Brighouse. There are at least 13 firms in Bradford using silk, 1 firm alone employing over 5,000 people, where not only silk spinning but also the manufacture of silks, velvets, silk plushes, etc., are carried on.

The Ladies' All-British Fabric and Fashion Association is reported to have been active in endeavoring to popularize all-British fabrics. As a result of its efforts in theatrical circles, many thousands of dresses have been made from all-British fabrics.

#### **The Lining Trade.**

Lining manufacturers had a good year, and their turnover was large. It is stated that owing to the demand for tailor-made costumes for ladies and the light colors prevailing in men's clothes, there was a big trade in colored linings, including both italians and mohairs, the latter chiefly for export. In cotton linings manufactured, or at least finished, in Bradford there was a distinct increase in the home and continental trade, mainly in the higher-grade finishes.

The mercerized cotton linings have in many cases been adopted in place of union linings and the more expensive silk. Such a perfection has been reached in the finish of these cloths, such as the satin and italian cottons with the marquise, schreiner, or other finish, that the silk effect can be purchased for the price of cotton linings. The shipment of stuff linings to the United States fell off considerably last year, but in cotton linings there was a slight increase.

#### **Establishment of Dyeing Branch in United States—Carpet Trade.**

One of the dyeing firms of Bradford has established a branch in the United States (Bradford, R. I.), and it remains to be seen if, in order to save duty, goods in the gray will be exported from this district to be dyed and finished in the United States.

It is stated that the output of carpets and rugs in the United Kingdom last year exceeded that of any previous year, although the increased use of linoleum is an important adverse factor. There was a growing demand for the better qualities of carpets. Although prices were slightly advanced early in the year, owing to the increased cost of raw materials, profits are said to have been small. This is due to the keen competition of the many British manufacturers and the foreign imports. An English publication stated that "a fabric is being perfected which when placed on the market must prove a serious rival to some of the oriental carpets which so long have been in favor."

#### **The Iron, Machinery, and Tool Industries.**

The firms engaged in the iron, machinery, and tool manufacture had a good year, several factories working overtime. At Keighley the worsted-spinning machinery trade experienced a steady demand, although there was a considerable falling off in the shipments to the United States.

At Otley, where printing machinery is manufactured, business was brisk and the export trade is being greatly developed. This machinery is not only shipped to the British colonies and to most of the European countries, but also to South America and to China and Japan. The shipments of printing machinery to the United States last year were valued at \$6,788. According to a press report, a device has been inserted on the printing press manufactured at Otley whereby the sheets are removed from the press without the aid of flyers and without anything touching the printed surface, thus obviating all chance of smearing.

#### **Increased Sales of American Goods—Automobiles.**

The sale of American goods continues to increase, and the introduction of new lines from time to time indicates that the British public are always ready to purchase foreign products which appeal to them. Statistics showing the imports from the United States into this district can not be obtained. A large percentage of American goods sold here are obtained from branch houses or agencies established in one of the principal cities, where stocks are carried ready for immediate distribution.

There was an increase in the sales of American automobiles last year compared with the previous year. In certain makes the demand was greater than the supply. Since the Government has raised the tax on motor cars according to horsepower, the demand for the higher-priced car has declined, while the medium and lower-power cars of 15 to 25 horsepower are in demand.

During the past year a new motor vehicle, called cycle car, has been developed. It is in reality a light four-wheeled runabout seating two passengers and with engines up to 8 horsepower. There are several makers experimenting with belt, chain, and shaft drives in endeavoring to place on the market a popular vehicle which can be produced to sell under \$480. The greatest drawback appears to be the high cost of a differential in the back axle, and various attempts have been made to do without it.

#### **Demand for Dental Appliances, Hardware, Electrical Appliances, etc.**

American dental appliances are used to some extent by most of the leading practitioners in the Bradford district. The education committee of the city recently established a clinical department, and all school children have their teeth examined periodically. In artificial teeth both the American and English make are used in combination, the incisors of the former being preferred, owing to their more natural appearance.

The demand for American hardware was normal. American engineers' and woodworking tools are recognized as the best on the market. When times are good and workmen have the money they invariably purchase high-class tools, realizing that they give better results.

American vacuum cleaners are selling well in this district. Among other American products favorably received are brass valves, unions, engine packing, carborundum, and lawn mowers.

Business in electrical accessories was good during 1911, but American wares have not made much headway in this market. The standard requirements are said to be more stringent in Bradford than in any other city in the country, and American goods have been

at a disadvantage. To overcome this disadvantage lamps should be made with bayonet connections in place of the screw, and switches in tumbler instead of the thumb styles.

#### **American Organ Installed—Canned Goods.**

A large electric organ, valued at over \$10,000, was purchased from an American firm and erected for exhibition purposes in the establishment of a leading musical firm. Great interest was manifested in the instrument, and in a short time it was disposed of to a local purchaser, and there is every probability of further sales.

American canned fruits, especially apricots, peaches, pears, and pineapples, have been selling well on this market; also certain canned vegetables, such as tomatoes and asparagus. Prices in American hog products have been so high that the demands for the Russian and Danish products were stimulated. There were increased receipts of canned meats from South America and Australia, owing to the high prices of the American product.

#### **Decreased Trade in Leather Shoes but Increased Purchases of Overshoes.**

The demand for American shoes on this market has declined considerably. A large number of British firms manufacturing on a large scale have retail establishments in the principal cities and towns of the country. Shoes are retailed in this district at as low as 95 cents per pair, though only suitable for dry weather. A serviceable pair can be obtained at \$1.70, but the popular price is \$2.55, and there are stores which confine themselves exclusively to this figure.

A good trade continues to be done in American overshoes, which sell at 46 cents to \$1.20 per pair, the principal demand being for those selling at 85 to 90 cents per pair. This demand is said to be owing to the neater appearance of the American shoe as compared with other makes and to the manner in which it holds its shape and fits more perfectly to the foot.

#### **American Shooks and Packing Cases, Soap, Toys, and Wall Papers.**

American shooks and packing cases for shipping textiles continue in demand, and direct importations are regularly made. American-made flat rolling boards and round wooden rollers for use in folding or rolling cloths are in demand in the district.

American cottonseed hard soap is extensively used in this district for scouring purposes. The superiority of this soap has been so fully demonstrated that a market for it is assured if exporters desire to extend their sales.

American toys, such as dolls, balloons, sledges, wagons, etc., were in demand during the last year. The dealers are always on the lookout for novelties and anything new which meets the popular fancy is quickly taken up.

American wall papers are being supplied by the leading decorative houses and are said to compete favorably with the British product. During last year there was a fair sale in medium and better class qualities and it is anticipated that business will increase. Stocks are carried in London and sample books showing the various designs are supplied to the decorators from which their customers make selections.

**Cooperation of Consulate in Extending Sale of American Goods.**

Among the numerous inquiries addressed to this consulate from American firms desirous of obtaining information are a number which appear to have been sent to probably every consulate asking for particulars which could often be readily and fully answered by one consul in each country. While attention is gladly given to every letter received, it would certainly be a saving of time and labor if some method could be devised whereby such unnecessary duplication could be avoided.

Rarely do American firms notify the consul as to the results which accrue through information given in letters sent to them as to local conditions, and at times even an acknowledgment of the receipt of such letters or reports is never received at the consulate. This is unfortunate, for whenever such further correspondence is received it is of mutual advantage and interest; supplemental information can be furnished by the consulate to overcome any difficulties or correct any mistakes, and, furthermore, the experience in one case is valuable when dealing with another and perhaps similar case.

Almost without exception the catalogues received at this office have the prices of the goods stated in dollars, which is a serious drawback, as in many cases the foreign merchant will not take the trouble to convert the prices into his own currency. Also the frequent practice of quoting prices f. o. b. at the American factory or seaport is another drawback with firms that are not familiar with trans-Atlantic freight rates.

---

**INTERNATIONAL BUILDING EXHIBITION.**

[From Vice Consul Rudolph Fricke, Leipzig, Germany.]

Plans have been completed for the International Building Exhibition to be held at Leipzig from May to October, 1913. It is expected to demonstrate the surprising progress which the art of building has made in the past 20 or 30 years. The official participation of foreign Governments and the great influx of foreign visitors anticipated, especially of State and municipal officers and experts, will afford exhibitors superior opportunities for making valuable connections. The classification plan for exhibits embraces eight sections, as follows:

- (1) Architecture.
- (2) Literature of architecture and building; technical educational institutions; office requisites for architects and engineers.
- (3) Building materials, their manufacture or preparation and use.
- (4) Machines, tools, and apparatus used in building.
- (5) Sale and purchase of building land; building finance; estate agencies; insurances in connection with dwelling houses; bookkeeping for builders and architects.
- (6) Sanitation for dwellings, factories, and streets; protection of workers from injury, first aid and other provisions for their health and comfort; precautions against fire; old-age and invalid insurance.
- (7) Gymnastics, games, and sports.
- (8) Testing of building materials, technical demonstrations.

The exhibits in the various groups may include parts or actual buildings or constructions, and demonstrations as well as models, drawings, photographs, and other appropriate representations.

Further information concerning the exhibition may be secured from the management—No. 1, Windmuehlenweg, Leipzig, Germany.

**MEXICAN TRADE STATISTICS.**

According to Mexican official statistics, the imports into that country for the last six months of 1911 showed a decrease in value of \$6,873,319 compared with the same period the previous year. The exports out of the country, however, showed a slight gain.

The United States supplied 57 per cent of the total imports into Mexico for last year's period, against 55 per cent for the 1910 period. Of the total exports out of the country during the last six months of 1911, 74 per cent, against 77 per cent in 1910, were destined for the United States.

**Trade by Countries.**

The following table shows the total value of the imports into and the exports out of Mexico, by countries, for 1910 and 1911:

Countries.	Imports.		Exports.	
	1910	1911	1910	1911
United States.....	\$29,109,226	\$26,153,839	\$53,992,323	\$52,350,092
Austria-Hungary.....	594,773	365,585	6,929	22,440
Belgium.....	1,226,535	971,554	1,617,994	1,516,037
Canada.....	264,299	143,296	321,523	247,596
Central America.....	14,549	17,308	404,309	449,502
China.....	118,104	80,411	3,970	—
France.....	4,658,193	3,602,090	2,027,792	1,796,796
Germany.....	6,700,519	6,043,257	1,667,714	1,859,091
India.....	536,918	503,340	—	—
Italy.....	531,077	399,315	13,181	49,508
Japan.....	127,880	149,682	6,280	78
Netherlands.....	153,364	127,340	4,738	32,467
Spain.....	1,460,711	1,201,981	413,640	737,905
South America.....	438,425	214,491	8,344	5,181
Switzerland.....	341,888	870,973	940	2,448
Other countries.....	6,426,706	5,535,407	9,256,916	11,149,621
Total.....	52,753,167	46,879,848	69,646,573	70,219,691

Of the total imports into the country for the last half of 1911, merchandise valued at \$17,474,178 entered by the port of Vera Cruz, followed by Tampico with \$9,630,296, Nuevo Laredo \$4,814,321, Ciudad Juarez \$3,796,232, Progreso \$1,934,290, Ciudad Porfirio Diaz \$1,334,142, and Coatzacoalcas \$1,134,822.

**Principal Mexican Purchases.**

The following table shows the principal imports and their value into Mexico for the last six months of 1910 and 1911:

Items.	1910	1911	Items.	1910	1911
Animal products.....	\$4,679,408	\$4,416,292	Vegetable products.....	\$10,975,634	\$6,943,370
Arms and explosives.....	674,431	1,543,230	Vehicles.....	2,229,666	1,339,110
Chemical products.....	3,170,571	2,937,326	Wines, spirits, etc.....	1,009,341	1,447,521
Machinery and apparatus.....	6,336,196	6,468,224	All other.....	2,497,705	2,308,750
Mineral products.....	12,847,130	12,543,928	Total.....	52,753,167	46,879,848
Paper and manufactures of.....	1,503,440	1,177,034			
Textiles and manufactures of.....	6,229,745	4,697,053			

**Products of the Country Exported.**

Mineral products represent the principal exports out of the country, the total of which amounted to \$45,937,103 for the last six months of 1911, against \$42,603,411 for the same period the preceding year. The shipments of vegetable products amounted to \$17,475,427, a

decrease of \$4,024,166 compared with the 1910 period. The following table shows some of the principal exports from Mexico during the last six months of 1910 and 1911:

Items.	1910	1911	Items.	1910	1911
<b>Animal products and live stock:</b>			<b>Vegetable products:</b>		
Hides and skins, untanned.....	\$3,818,707	\$1,408,599	Beans, kidney.....	\$463,253	\$346,392
Honey.....	51,309	28,013	Coffee.....	1,447,580	1,472,010
Live stock.....	1,399,057	2,539,782	Chickie.....	490,795	447,645
Other animal products.....	256,081	905,525	Chick peas.....	487,652	1,508,946
<b>Mineral products:</b>			Dyewood.....	64,837	130,807
Antimony.....	420,982	436,846	Indian corn.....	33,364	35,766
Copper.....	6,345,457	8,640,284	Lumber.....	739,291	972,153
Gold.....	14,696,318	12,854,496	Rubber.....	9,613,649	5,254,814
Lead.....	1,482,728	1,479,399	Vanilla.....	407,748	626,612

Zinc.....	170,359	226,825	All other articles.....	1,017,813	1,473,879
Other minerals.....	162,267	574,798	<b>Total.....</b>	<b>60,646,573</b>	<b>70,219,091</b>

Of the total exports for last year's period merchandise valued at \$20,834,808 was shipped by way of Tampico and \$19,661,510 worth by way of Vera Cruz. The exports through Ciudad Porfirio Diaz were valued at \$5,061,957, Progreso \$4,372,140, Ciudad Juarez \$3,344,829, Laredo \$2,969,930, and Nogales \$2,564,962.

### THE IRON MINES OF NORMANDY.

[From Consul James E. Dunning, Havre, France.]

Numerous requests for information regarding the iron-ore deposits in this district have reached the Havre consulate in response to a trade opportunity appearing in the February 10 issue of Daily Consular and Trade Reports. Although the quantity of ore produced by the majority of the mines is at present comparatively small, great efforts are being made to increase the output, and in most cases augmentations of production of at least 100 per cent are predicted for 1913. In addition to the mining companies, there has been formed a society which is now erecting blast furnaces in Caen to treat the low-grade ores, the high-grade ores being reserved for export.

The port of Caen, which up to the present has carried on only a small trade in dairy products with the British Isles, is not sufficiently developed to cope with the enormous increase in tonnage which the export of large quantities of iron ore will represent, but active measures are being taken to enlarge the docks and to deepen the channel of the canal leading from the sea to the city. At the time of writing [Apr. 19] the canal can admit vessels up to 3,000 tons burden.

American firms desirous of offering mining or other machinery to the companies referred to [and whose names may be obtained from the Bureau of Manufactures] should do so through their Paris representatives; or in case they have no such agents, it could be done direct by sending catalogues with an accompanying letter in French. Operations are bound to become very large within the next two or three years, and this is one of those numerous cases where direct methods employed in the right quarter should accomplish much. Due notification will be given by this consulate of any opportunity arising for American firms to bid on harbor works at Caen.

[An article by Consul Dunning on the iron-ore deposits of lower Normandy was published on Jan. 26, 1912.]

**HUGE EGYPTIAN DRAINAGE PROJECT.**

[From Consul D. R. Birch, Alexandria.]

One of the most costly and comprehensive drainage projects for the reclamation of lands undertaken by any Government in the world, and certainly the greatest enterprise of its kind in Mediterranean countries, has just been begun by the Egyptian Government to make cultivable one million acres of fertile land in the delta of Lower Egypt. The reclaiming of these lands will necessitate an expenditure approaching \$15,000,000 for drainage and approximately a like amount for irrigation. The work as planned will require over four years and will be brought to completion about the end of 1915. The principal object of the project is to redeem a tract of unproductive land and bring a fertile but now worthless region of the delta under cotton cultivation. When this is done it is roughly estimated that the increase in value of the reclaimed and improved land will approximate \$100,000,000. The land to be reclaimed is 90 per cent Government owned.

The two projects, known as the West Behera and Gharbia drainage systems, while entirely separate and distinct and many miles apart, will, nevertheless, be proceeded with coincidentally. A feature of the western or Behera plan is the draining of Lake Mariout, which covers an area of over 35,000 acres. This lake, an ancient historical site, will thus disappear forever and be replaced by fertile cotton-producing fields equal to those found anywhere in the world.

**The Behera Project.**

Considering the Behera project separately, the total land to be placed under effective modern drainage approximates 480,000 acres, of which 330,000 acres are classed as cultivated. The latter area, however, is at present poor in producing qualities, and it is the theory of the Government that when properly drained it will equal for cotton-growing purposes the best of the delta. The remainder is unfit for cultivation of any kind, and comprises the 35,000 acres of Lake Mariout, its arm, Lake Mallaha, and the low swampy land bordering on these lakes. All the territory covered by the Behera project is that which is now drained into Lake Mariout, which in turn is kept 3 meters (9.84 feet) below sea level by pumps at the station at Mex, just west of Alexandria. Lake Mariout is separated from the Mediterranean Sea by a narrow strip of land and is approximately 1 meter (3.28 feet) deep. Twelve high-speed centrifugal pumps will be installed at the Mex pumping station and these will drain the lake and keep the subsoil water to a depth of 5.6 meters below sea level. Each of these pumps is of 1,000 brake horsepower and has a lift of 6 meters.

**The Gharbia Project.**

The Gharbia project contemplates the draining of 470,250 acres, one half of which is unfit for cultivation of any kind, and in the region comprising the other half and classed as cultivated the only crop raised is rice. All the land in this section is above water and the drainage channels will convey the water down deep drains to Khassa, near Balteem, and there pumped into Lake Borollos, which opens into the Mediterranean. The pumps to be used in this section will probably be of the slow speed turbine class having a lift of 2.5 meters. It

is planned to install 15 such pumps of 350 horsepower each, possibly operated by steam, which is considered as more satisfactory for slow speed. [A map indicating the area of the two sections to be drained will be loaned on application to the Bureau of Manufactures at Washington.]

#### **The Construction Program.**

The scope of the work in both districts includes the remodeling of all existing drains and the construction of new trunk drains leading to the pumping stations. All drains will be at a uniform depth of 6 meters; the new ones to be constructed to that depth and existing drains to be lowered 3 meters below their present level. The layout of the drainage system when finished will insure that no individual plot of land is more than 2 kilometers ( $1\frac{1}{2}$  miles) away from a public State-maintained drain; and it will further insure that the water surface in such drains will always be at least 1.5 meters (5 feet) below the adjacent cultivable land. Practically every acre of land in the two sections now uncultivable owing to deficient drainage will be provided with a thorough drainage system, and the improvement of the channels of existing drains will facilitate their subsequent maintenance in a high state of efficiency at moderate cost.

The first cost of the work in the West Behera district is estimated at \$6,950,000 and the maintenance of the drains when completed will approximate \$660,000 annually. In the Gharbia Province the first cost will be \$5,960,000 and the yearly expenditure for maintenance \$390,000.

This huge work, so important to the culture of Egyptian cotton, is conjectured to be but the first of a series of similar projects which in years to come will be carried out in Lower Egypt to bring the entire delta under cotton cultivation. It is believed that upon completion of the present work, providing the success hoped for is achieved, that other and larger lakes bordering on the Mediterranean will be drained in the same manner as Lake Mariout and converted into cotton fields.

The necessity for some such project as now begun has long been recognized by the Government. It was one of the first matters to engage the attention of Lord Kitchener, who in November last urged the immediate start of the work and arranged that the Government's 1912 budget provide money from the reserve fund for the preliminary work. Sir William Garston and Mr. A. L. Webb, who act at times as consulting engineers of the Egyptian Government, were called from England and made a careful investigation of the scheme as outlined, and the work will now be carried out as approved by these experts.

The present drainage project is regarded in importance to the future of Egypt as second only to the Assuan Dam. This year will see the completion of the Assuan Dam to its new level, which will mean that in 1913 the dam will hold about two and a quarter times as much water as hitherto and thus provide ample water supply for the irrigation of the land now to be drained.

#### **The Yield per Acre Question.**

The prosperity of Egypt lies almost entirely in its cotton crop, which approximates a value of \$100,000,000 annually, and the Government is consequently always alive to the importance of extending the cotton-growing area. At present the cotton fields of Egypt

cover 1,603,266 acres, most of which are in the delta. The crop of 1911 was 650,000,000 pounds, but there has within the past few years been a falling off in the yield of cotton per acre. Several years ago the acre gave 525 pounds of cotton, whereas the same land to-day averages only 440 pounds. One of the problems of the Irrigation Administration concerns the movement of subsoil water. In the lands now to be drained the subsoil water reaches, even on those now classed as cultivable, to within 4 or 5 feet below the ground surface, and thus the feeding root of the cotton plant, which extends  $1\frac{1}{2}$  to 2 meters into the ground, is immersed in subsoil water. When the drainage projects are completed the subsoil water in every acre of land in the drained districts will be kept more than  $1\frac{1}{2}$  meters below the level, and thus the cotton plant freed from its deleterious influences.

[Some further details concerning pump and dredger outfits for these drainage works may be had from the Bureau of Manufactures at Washington.]

---

### PRODUCTION AND INCREASING USE OF PETROLEUM.

[From the Berlin Export; translated in the Bureau of Trade Relations, Department of State.]

The English coal strike has brought up the question of how and to what extent coal can be replaced by liquid combustibles or other sources of power. The most-favored countries in this respect are probably the Scandinavian, possessing, as they do, in their waterfalls a great source of power. Lately it has been found that the method worked out by a Swedish inventor of firing locomotives with pulverized peat is practical and economically just as advantageous as coal.

However, the use of these resources, water power and peat, is confined to certain countries. It is different with petroleum, which is one of the generally available products of the world.

The total production in America in 1911 was approximately 83,000,000 barrels. In Russia the slackening of the output of the wells in the Baku region became decidedly apparent last year, showing a decrease from 478,000,000 to 427,000,000 poods (57,382,953 to 51,260,504 barrels). The total production of Russian petroleum declined as compared with 1910 by 28,000,000 poods (3,361,345 barrels), and amounted to 554,000,000 poods (66,506,603 barrels). Roumania produced in 1911 somewhat more than 1,500,000 tons (30,785,000 barrels), and exported about 700,000 tons (5,033,000 barrels). As is well known, the industry is carried on almost exclusively with foreign capital, only 10,000,000 of the 280,000,000 marks (\$66,640,000) employed being Roumanian. Germany controls 58 per cent of the total capital.

If coal shall be replaced by petroleum to a considerable extent, it is clear that energetic measures will be necessary to provide suitable ships for the colossal transportation which may be expected. In England there are being built at present not less than 45 tank steamers with 800,000 tons loading capacity, but the demand for petroleum is increasing to such an extent that it hardly can be satisfied. England, for instance, imported last year 343,000,000 gallons (8,166,667 barrels), or 22,000,000 gallons (523,810 barrels) more than in 1910. The way in which these increasing amounts of petroleum are being used may be gathered from the fact that the imports of illuminating oil have decreased 20 per cent, whereas the imports of petroleum for power purposes have increased 150 per cent. The largest imports come from America, Russia being second, and Roumania third.

[A review of the world production of petroleum in 1910 was published in *Daily Consular and Trade Reports* on Feb. 3, 1912.]

---

### Bound Volumes of Daily Consular and Trade Reports.

The Government Printing Office will supply regularly in quarterly volumes, with complete 32-page indexes, bound sets of *Daily Consular and Trade Reports* from January 1, 1912. The price is \$1.50 per volume or \$6 per year, in order to cover the cost of the index and binding. Those desiring the bound volumes should write to the Superintendent of Documents, Government Printing Office, Washington, D. C.

**ROUMANIAN BUREAUS OF COMMERCIAL INFORMATION.**

[From American Minister John B. Jackson, Bucharest.]

There is transmitted herewith a copy of a pamphlet entitled "Réglement Concernant l'Organisation et le Fonctionnement des Bureaux Régionaux d'Informations Commerciales," which I have just obtained from the Roumanian Ministry of Industry and Commerce. The 11 "regional" bureaus of commercial information referred to in this booklet have been organized with a view to their working in connection with local chambers of commerce to obtain and disseminate information tending to develop Roumanian commerce. They are ready to furnish such information to all interested persons and to give indications in regard to the commercial standing of merchants at home and abroad—always without accepting any responsibility in the premises.

The booklet gives the following statistical information relating to Roumania:

*Principal products.*—Cereals, vegetables, grains, lumber, and petroleum (the production of petroleum was 1,418,518 tons in 1911).

*Government-aided industries.*—Fixed capital, \$53,481,922; products, \$66,778,000, divided approximately as follows: Textiles and manufactures, \$3,492,000; foodstuffs, \$23,932,000; paper and cellulose, \$2,702,000; chemical and electrical articles, \$14,089,000; miscellaneous products, \$17,563,000.

*Foreign commerce in 1910.*—Imports, \$79,075,106; exports, \$118,985,440.

*Railways.*—Length, 1,980 miles; amount actually expended, \$166,570,674; nominal capital, \$183,392,261; net revenue, \$6,021,538.

*Navigation.*—State River service on the Danube, 127 ships, of which 11 are for passengers. Roumanian maritime service (belonging to the State), 12 vessels, of which 5 are mail boats carrying passengers and 5 are freighters.

*Rural cooperation.*—2,656 rural banks, with a paid-up capital of \$11,773,000.

*National bank.*—Statistics for 1911: Notes issued, \$98,352,242; metal reserve, \$30,559,197; gold drafts, \$11,843,777.

[The pamphlet referred to in the foregoing report, which is printed in French, will be loaned upon request by the Bureau of Manufactures.]

**CONSULAR TRADE CONFERENCES.**

Francis Miltoun Mansfield, American consular agent at Toulon, France, now in the United States on leave of absence, will be pleased to meet business men to discuss trade conditions in his district. Mr. Mansfield is familiar with road conditions in Europe affecting the type of automobile best suited to various localities and can especially inform those interested in regard to the market conditions in France for American automobiles. His address until June 15, 1912, is Hotel Avon, Thirtieth Street and Lexington Avenue, New York City.

**SEAL FISHERY OF NEWFOUNDLAND.**

[From Consul James S. Benedict, St. Johns.]

The sealing voyage for 1912 closed May 11, with the discharge of the last of the fleet of 23 steamers engaged in the fishery. The total number of seals landed was 175,128, valued at \$329,104, which is only about half an average voyage. The catch is 129,463 seals short of last year and \$164,530 less in value. The loss to the suppliers is almost unprecedented, while practically half the crews made less than the cost of supplies advanced them; 4,176 men were engaged in the fishery, and every man returned safely to port.

## FOREIGN TRADE OPPORTUNITIES.

(Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.)

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8912. Pumps and dredging.**—An American consul reports that an excellent opportunity is open to American pump manufacturers and dredging contractors in connection with a scheme begun by a foreign Government to reclaim a vast amount of land. It is roughly estimated that \$30,000,000 at least will be spent by the Government within the next four years in the drainage and irrigation work on this tract of land. The Government officials have expressed a hope that American firms will submit bids for both the machinery required and for the dredging to be done. Copy of the complete report, giving further detailed information, will be sent to interested firms by the Bureau of Manufactures; also map of the region to be drained.
- No. 8913. Electrical signs.**—The Bureau of Manufactures is in receipt of a communication from an American forwarding firm stating that one of its correspondents in a European country has written that it is interested in electrical moving signs. Houses making a specialty of this class of work are requested to send catalogues and any other information that would prove useful. Communications, etc., should be sent direct to the foreign firm.
- No. 8914. Railway supplies and steel building material.**—A foreign Government will at an early date solicit bids for a large quantity of rails, fishplates, and rail rests for both its broad and narrow gauge roads. The exact date will be determined on shortly. An American consul has had several conferences with the official in charge of this matter and the latter has manifested a keen desire that American firms should take part in submitting proposals, and, if possible, to secure the order. Other construction work is being contemplated in the country in question, and proposals will be received in the near future for the construction of port works, bridges, etc. Considerable quantities of steel building material will be needed, and the securing of this contract will undoubtedly open a vast field for American steel products, in addition to other articles which will be required. Copy of the complete report, specifications which accompanied it, and other particulars can be obtained by interested firms upon application to the Bureau of Manufactures.
- No. 8915. Iron bridges.**—Supplementing a previous report on the demand for iron bridges and road machinery in which a foreign Government is interested, an American consul now reports that detailed information concerning the cost of iron bridges is desired by an official at the earliest possible date. Catalogues and other information should be sent direct to the official, and it would be well also to communicate with another person whose name is given in the report.
- No. 8916. Petroleum, benzine, and heavy oils deposit.**—An Italian company proposes to erect a new deposit for petroleum, benzine, and heavy oils in proximity to an important Mediterranean seaport. It is proposed to keep in stock 12,000 cubic meters of petroleum and 2,000 cubic meters of benzine and heavy oils, subject to increase in proportion to the successful operation of the enterprise. The plant is to consist of eight departments, as follows: General offices; pumping appliances; weighing apparatus; storeroom for timber and tinplates; workshop for the manufacture of tins and wooden packing cases; room for filling petroleum tins; room for filling benzine tins; and storeroom for filled tins. The company desires to communicate with American concerns able to furnish the oil and eventually disposed to invest capital. In the latter event the company would intrust the American firm with the technical management and supervision of the plant.
- No. 8917. Cotton goods, phosphates, metals, copper plate and wire.**—An American consular officer in a European country reports that a business man in his district desires to represent American firms dealing in cotton goods, phosphates, metals, copper plate and wire.
- No. 8918. Trunks and handbags.**—A business man in a Mediterranean country informs an American consulate that he desires to communicate with American manufacturers of trunks and handbags. American goods of this class are unknown at present, but the inquirer, who is an American, believes they can be introduced. Goods of cheaper grades are desired, and prices should be quoted c. i. f. point of destination. Correspondence in English.

## TRADE OF DUTCH PORTS.

### AMSTERDAM.

[By Consul Frank W. Mahin.]

In spite of the strike of the seamen and dock laborers and the remarkable heat and drought of the summer, all the industries in this region were unusually active and reasonably profitable during 1911, with the exception of the hotels, boarding houses, and the shops which depend on the tourist trade. Owing to the excessive heat and the interference with transportation caused by the strike, the number of visitors in Amsterdam was about 20 per cent below the 1910 figure. This discouraged the project broached in 1910 for a new first-class hotel, which then seemed to be much needed. The Turco-Italian war had no appreciable effect on the business of this district. Although business generally was active, the percentage of unemployed workmen was relatively high in this district.

The Amsterdam Stock Exchange was relatively quiet during the year. The interest in American securities, in which Amsterdam generally invests more heavily than in those of any or possibly all other countries, decreased. Petroleum shares figured actively on the stock exchange, while mining shares declined. Shares of Dutch colonial industries were generally profitable and there was a particularly strong market for sugar and tobacco stocks. The profit on both the Sumatra and Borneo tobacco crops was about 40 per cent higher than that of 1910. The high prices of sugar naturally affected sugar stocks. The increased colonial activity raised the prices of shares of the East Indian tramways. An effort was made to press tea shares last year, but too frequent emissions and other unfavorable circumstances put them again in the background. Dutch national securities and those of South American countries maintained steady prices, but those of China, Japan, and some European countries ruled low. In

contrast to the stock branch of the exchange, the produce branch was uniformly lively during the year.

**Harbor Improvements—Shipbuilding.**

Several important improvements to the Amsterdam harbor were completed during 1911, providing a considerable increase of dock room. Other projects, still unfinished, will provide new quays and materially enlarge existing basins, with special reference to the accommodation of the largest type of steamers, for which the dock facilities are now inadequate. Accessory to these improvements, plans were framed for greater locks at the sea entrance of the North Sea Canal, to admit the largest vessels that may be expected at this port. This improvement will be made as soon as the necessary preliminaries are completed.

During 1911 the arrivals of seagoing steamers at Amsterdam numbered 2,165, of 10,001,864 cubic meters capacity, and sailing vessels, 195, of 111,879 cubic meters capacity, an increase of 8 steamers and 65 sailing vessels over 1910. The substantial increase in the number of entrances and clearances of Dutch ships seems to justify the claim that they are displacing foreign ships in the home trade. The arrivals from every other country, except the United States, Denmark, Spain, Russia, and Italy, decreased, and the combined increase of those five countries amounted to only 19 vessels. One American ship arrived and cleared in 1911, none in 1910.

Further evidence of the shipping revival in the Netherlands is the great activity in Dutch shipyards, which could not fill all the orders offered them in 1911. In several cases ships were built in British yards, as the orders could not have been filled here for a year or more. More ships were under construction in Dutch yards in former years, but never so large a volume of tonnage.

The principal shipbuilding firm in Amsterdam finished in 1911: Two steamers of 2,000 and 8,076 gross tons, respectively; a floating dry dock of 12,000 tons; a steam tug of 184 tons; and a motor ship of 372 tons. At the end of the year the same company was building seven steamships, ranging from 160 to 9,000 tons; two motor tank ships of 2,400 and 4,500 tons, respectively; a dredging machine of 1,700 tons; a steel floating dry dock of 14,000 tons; and a floating steam crane with a lifting capacity of 12 tons.

**Motor Warships—New Passenger Steamers—Canal Navigation.**

At the Government navy yard here, three coast-defense motor vessels of 540 tons displacement, armed with 4-inch guns, were under construction at the end of the year. The Netherlands is said to be the first country to build motor warships.

A number of smaller ship and boat building concerns turned out a large number of craft of various kinds during 1911 and were busily engaged at the end of the year. Two mail steamers, of 14,000 tons and carrying 1,800 passengers each, are to be built for a shipping company for the South American trade, with a speed that will reduce the time of voyage to 14 days. These are expected to be launched in 1913.

The principal entrances to the harbor of Amsterdam are through the North Sea Canal, the Zuider Zee, and the Merwede Canal connecting with the Rhine River. Through the locks at the mouth of the North Sea Canal, 2,268 steam and 12,280 sailing vessels passed in 1911;

through the Zuider Zee locks near Amsterdam, 25,798 steam and 44,017 sailing vessels; and through the Merwede Canal, 5,616 steam and 21,547 sailing boats. Navigation was at no time interrupted by ice.

#### **The Diamond Industry.**

The demand for diamonds was good in 1911; brokers received their usual percentage and general dealers realized fair profits. The diamond workers fared well, as wages were steady and employment regular, though two strikes during the year made the number of idle workmen unusually large at times.

On the other hand, the proprietors of diamond-cutting factories describe 1911 as a particularly bad year. It is common report that they all lost money, though none failed. It is said that no actual failure has occurred in this industry in Amsterdam for many years. The diamond-cutting firms are forced to continue operations even at a loss or lose valuable customers, who would go elsewhere and perhaps never return, and lose their skilled workmen, whom they might not be able to replace.

The difficulty besetting the cutting industry last year is charged to the London rough-diamond syndicate, which fixes not only the primary but also the ultimate price of diamonds. An Amsterdam diamond expert writes as follows on this and other points:

The London syndicate puts continuously higher prices on the rough goods, or sells goods of an inferior quality at the same prices. Consequently the polished diamonds ought to be sold at much higher figures.

There is no doubt but that the diamond business is on a good basis. There are of course always certain articles the prices of which are subject to more or less important changes, but the principal articles, especially large goods, are at least 15 to 20 per cent higher than in the beginning of 1911, and in the near future we will see much higher prices.

The bigger exports from Antwerp to the United States which are shown by the statistics are not a consequence of a larger business, but many goods bought in Amsterdam are taken along by the buyer to Antwerp and shipped from that city to New York. On top of that, many Amsterdam brokers and dealers go to Antwerp every week and sell goods there which are also shipped from Antwerp and thus enlarge the amount of the exports.

Generally speaking, the medium qualities of diamonds were preferred in last year's trade. The rose branch was rather quiet.

#### **Diamond Markets—Labor—New Diamond Exchange.**

While Amsterdam's diamond trade with the United States showed a slight decrease, the trade with European countries increased, though no statistics are compiled showing the volume of that trade.

The expectation, some time ago, that there might be an overproduction of rough diamonds shows no signs of realization. The De Beers mines, by alleged careful limitation, produce a regular annual quantity, stated to be from 2,200,000 to 2,500,000 carats. Several years ago, a large and increasing output from the German South African mines seemed probable. Their production increased from 486,000 carats in 1909 to 798,000 in 1910, but as the 1911 product is reported to be much the same as that in 1910, the fears of overproduction from this source are allayed, and even a decrease in the output of these mines is predicted.

The number of organized workmen in the diamond trade of Amsterdam is now about 10,000, besides which there is a considerable number of unorganized workers. It is expected that over 1,000

apprentices will be admitted during 1912, most of them being children of diamond workers.

The large diamond-exchange building [described in Daily Consular and Trade Reports for Jan. 14, 1911] was opened in 1911. It contains a post office, safety deposits, assembly rooms, etc., and is daily visited by hundreds of people interested in the diamond business. Thus the entire trade, both wholesale and retail, rough and polished, is focused in one building.

#### Sugar Market Strong.

Although the drought of 1911 so affected the beet crops of Europe that the world's stock at the end of the year was short over 500,000 tons, the total beet crop of the Netherlands amounted to 1,720,000 tons, producing 252,000 tons of raw beet sugar, 39,000 tons more than the 1910 production. The shortage led to the importation of five ship-loads of raw cane sugar from Java, which had not occurred for many years. An effort is being made to establish a regular market for cane sugar here, such as formerly existed. The price of raw sugar in 1911 fluctuated between \$4.32 and \$8.04 per 100 kilos (220.46 pounds). In 1910 the range was from \$5.23 to \$7.24. The average price of refined sugar in 1911 ranged from \$6.23 to \$10.85.

The following table, prepared by the manager of an Amsterdam sugar refinery, gives the consumption, production, imports, and exports of sugar in the Netherlands for the past two years:

Varieties.	1910	1911	Varieties.	1910	1911
<b>CONSUMPTION.</b>			<b>IMPORTS.</b>		
Raw.....	<i>Met. tons.</i> 435	<i>Met. tons.</i> 365	Raw.....	<i>Met. tons.</i> 177,544	<i>Met. tons.</i> 190,534
Cane.....	3,073	2,700	Cane.....	62,230	48,069
First marks.....	13,687	10,130	Bastard.....	48,535	78,134
Refined.....	72,396	79,103	Total.....	288,309	316,737
Candied.....	2,087	2,213	<b>EXPORTS.</b>		
Bastard.....	13,243	11,743	Raw.....	186,128	183,181
Total.....	104,920	108,284	Cane.....	45,438	35,428
<b>PRODUCTION.</b>			Refined.....	141,948	200,753
Raw.....	177,341	210,658	Total.....	373,514	419,361
First marks.....	35,784	42,035			
Total.....	213,126	262,693			

#### Increased Use of Coffee Substitutes—Tea and Copra Markets.

The actual consumption of coffee is said to have decreased, despite the larger import in 1911, partly because of the advanced price and partly because of the greater use of substitutes for coffee. Factories producing these substitutes for coffee have largely increased in Europe in recent years, and the quantity of these substitutes consumed in the Netherlands is evidently important, although no estimate is made as to the amount. Several Dutch factories make coffee substitutes from chicory and various grains, while there are said to be 116 similar factories in France, 412 in Austria-Hungary, and 732 in Germany.

The imports of tea into Amsterdam in 1911 totaled 26,274,600 pounds, of which 13,260,800 pounds came from Java. The 1910 total was 30,237,500 pounds. Most of the exports of 15,251,600 pounds went to Germany and the British Isles. The value of the tea ex-

ported to the United States was declared at this consulate as \$35,448, but it is said that a large amount of tea for the United States is shipped through London.

The amount of copra marketed in Amsterdam in 1911 was much larger than that sold in the preceding year and was valued at \$20,100,000.

#### **Leather and Shoe Trade—Other Industries.**

Of the 15 or 16 tanneries in this consular district, 2 are very large and several others are important. The larger tanneries work especially on leather belting for export to the British Isles, while the smaller cater only to the local trade. The past year was a trying one for these tanneries, as the prices of hides were very high in proportion to the prices of leather. The trade in hides was about normal, most of the exports of cowhides going to Germany, Belgium, and France, while the calfskins were mostly sent to the United States.

The shoe manufacturers complained of the high prices of both leather and labor, and some reduced the quality of their products. It is predicted, however, that those who maintained their quality and raised their prices will do better in the future. Some manufacturers make good profits by exporting their goods.

The usual quantity of American shoes were sold here during the past year. Besides an American shoe store, many shops display American shoes prominently in their windows and others display shoes marked "American patterns," etc. A "Sorosis" store is soon to be opened here.

The timber and lumber market was lively in 1911, largely on account of the building activity. The prices of Russian and Swedish wood varied little, but that of American fir rose steadily.

The hot, dry summer made 1911 a remarkably good year for the breweries, of which there are some 200 in this district. The great demand for hops caused an increase in their price. Cigar manufacturers did well in the export business, but orders from the local dealers were comparatively few on account, it is said, of a tariff pending in the Netherlands Parliament changing the taxes on tobacco products.

The bicycle and automobile trade is reported to have been both large and profitable last year. The use of automobiles is spreading rapidly in Holland, and the output of all the local factories was completely sold in 1911. They are expected to increase their capacity and product in 1912. American automobiles grew in favor, and the imports, while small, showed a strong tendency to increase toward the latter part of the year. Most of the imported automobiles come from France, Germany, and Belgium.

#### **Exports to the United States.**

According to the invoices declared at this consulate, the exports from Amsterdam to the United States in 1911 showed an increase of \$1,197,102 over those of 1910, due to the increased shipments of tobacco, made chiefly on account of the higher prices prevailing. The fluctuations in the values of the other articles practically balanced each other.

Exports of coffee, linoleum, oils, rags, and tin have increased in value for several years past, as the demand in the United States has increased and the resources of this market have become better

known. The exports of kapok, rice, and tapioca flour have been declining for a long period, owing to a decreasing demand from the United States.

The principal exports to the United States during the past two years, as declared at the Amsterdam consulate, are shown in the following table:

Articles.	1910	1911	Articles.	1910	1911
Antiquities.....	\$37,211	\$42,809	Paintings.....	\$65,086	\$105,083

The exports to the Philippine Islands for 1911 were valued at \$41,394, a decrease of \$1,929 compared with the previous year. The principal articles for 1911 were as follows: Margarin, \$19,031; cheese, \$18,975; and cotton goods, \$2,365. The exports to Porto Rico amounted to \$58,908, compared with \$71,391 for 1910, and consisted practically entirely of cheese.

#### Imports of American Flour—Office Appliances—Cost of Living.

On the whole, direct and indirect imports from the United States to Amsterdam were greater than in 1910, though the statistics are not sufficiently specific to give detailed figures thereof. The aggregate import of flour decreased last year, but a larger quantity came from the United States than in 1910. The import from Germany decreased in about the same quantity as the American increased. According to the explanation of a local dealer, certain export inducements of the German Government were so modified that importing flour from that country was made relatively unprofitable in 1911.

The manager of an American office-supply company here reports a flourishing and expanding business with an American typewriter in which his firm specializes, but states that continental factories are making both flat and roll-top desks substantially as good as the American product, but at prices so much lower that his company is obliged to deal in them to hold its general trade. All the well-

known American typewriters are specially represented here, and they lead all others in use and popularity. An international exposition of office supplies in Amsterdam in 1911 brought American typewriters, adding machines, and calculating machines into comparison with similar products of the other countries, to the advantage of the American products.

The general upward tendency of the prices of commodities during the past 15 years was sharply accentuated in 1911 by the drought and excessive heat of the summer. Nearly all foodstuffs advanced in price, some vegetables rising 100 to 500 per cent. Bread was an exception, being a little cheaper at the end of the year than at the beginning. Fresh beef advanced 5 to 10 per cent, but veal, pork, and mutton remained practically stationary. Fresh fruits advanced somewhat in price, although not as much as vegetables, and the prices of canned and bottled fruits and vegetables also rose 10 to 20 per cent. Butter and cheese increased about 10 per cent, while eggs and poultry remained at about normal prices.

#### General Import Trade.

The table following shows the official Government records of the principal imports and exports at the port of Amsterdam during 1911. Germany was the largest single source of imports, supplying most of the agricultural and other machinery, nearly half of the drugs and paints, four-fifths of the coal, half of the dry goods, two-thirds of the stone, metals, and metal products, and most of the raw sugar. Belgium ranked second. The United States led in the flour imports, with more than one-third of the total; Russia led in grain imports; and Roumania sent as much corn as was credited directly to the United States. Other important items from the United States were fine woods, margarin, cottonseed oil, petroleum, lard, and fruit. (The metric ton is 2,204.6 pounds.)

**Farming—Land Values—General Statistics.**

The general drought throughout Europe benefited the farmers of most of the Netherlands, as their low-lying, irrigated farms produced crops of a fair quantity which brought unusually high prices. This prosperity did not extend to the live-stock industry, as the drought seriously impaired the pastures and reduced the yield of hay. To increase the difficulties of the cattle breeders, the foot-and-mouth disease broke out in the early summer and ran its course in spite of strenuous attempts to check it, dying out toward the end of the year. The disease is said to have come from Russia via Germany.

Land values have increased considerably in this vicinity in the last two years, \$400 per acre being a not unusual price for farm land, and rents of \$18 to \$20 an acre are not uncommon.

The population of Amsterdam was 581,000 at the close of 1911, a gain of 7,000 during the year. The city has grown at about the same rate for the past 10 years, this being substantially the difference between the births and the deaths. Immigration and emigration practically offset each other. The annual birth rate per 1,000 in Amsterdam is about 24 and the death rate 12. The number of houses built during the year was 1,100, a gain of over 100 over 1910. The total number of emigrants from Amsterdam in 1911 was 3,403, an increase of 212 over the previous year. Of these, 80 went to the United States and 3,226 to South America. Only 411 of the emigrants were Dutch.

The municipal tramways of Amsterdam carried 78,521,600 passengers in 1911, against 70,788,946 in the preceding year. The receipts in 1911 amounted to \$1,501,552, an increase of \$101,552 over 1910.

Of the 103,850 travelers registered at the 13 most important hotels, 14,129 were Americans, more than from any other country except Belgium. No compilation is made of the registrations at the many smaller hotels and pensions, which must far outnumber those of the 13 hotels.

There were 11,384 subscribers to the municipal telephone service at the end of 1911, an increase of 927 over 1910.

At the municipal abattoir 37,950 beeves, 33,387 calves, 9,296 sheep, 68,336 hogs, and 6,246 horses were slaughtered for food during the year. This was a decrease in beeves and an increase in all the other animals, in comparison with 1910. The figures indicate that mutton, although cheaper than beef, is a relatively unpopular food. At the present rate of increase, the horses slaughtered at the municipal abattoir will soon outnumber the sheep.

The municipal plants supplied 87,135,661 cubic meters (cubic meter = 35.3 cubic feet) of gas, 23,464,143 kilowatts of electric current, and 20,687,944 cubic meters of water. There were 1,454 fires in Amsterdam during the year, against 1,232 in 1910.

**Foreign Trade of Harlingen.**

Harlingen, a seaport on the Friesland coast, behind the chain of islands separating the Zuider Zee from the North Sea, does a brisk business and is the chief outlet for the products of the farms and paper and pasteboard factories of Friesland and the neighboring Provinces. The strike of the seamen and the drought reduced the volume of trade at this port during 1911. The steamer arrivals in 1911 numbered 378, of a gross capacity of 937,151 cubic meters, against 408, of 1,040,829 cubic meters, in 1910. Practically all the exports

from this port are products of the Netherlands. The following table shows the principal imports and exports at this port during 1911:

### ROTTERDAM.

[By Consul General Soren Lisoe.]

The city and port of Rotterdam, in the main, prospered in 1911. The uncertainty in trade caused by disturbances in various countries acted as a drawback on merchants and shippers, and the drought affected trade as well as prices. As beet-sugar contracts were based on the lower values, only the speculators profited by the rise caused by the drought. Unfavorable weather in the producing regions also advanced the price of rice, but the quality suffered and the imports may give the traders cause for regret.

#### American Import Trade Increasing.

The imports of the usual staple articles from the United States increased in quantities and values during 1911, and dealers state that the importations of American machinery, machine tools, kitchen ranges, and high-grade bathroom articles have increased materially. Lumber and staves have also been imported in increased quantities. The imports of American flour and meats at this port are on the decline, however. Reliable information places the imports into the Netherlands of dry-salted meats (pork) in 1911 at 4,000 boxes and 250 barrels, of casings at about 300 tierces, and of canned meats at between 6,000 and 7,000 cases. American canned meats, which until recently had practically a monopoly on this market, are suffering from the keen competition of canned goods from Argentina, and American packers are advised to take the necessary steps to meet this competition if they wish to retain control of the European markets.

A prominent importer of American machinery and machine tools writes this office as follows:

The present trade in American machine tools seems to be progressing gradually, and it appears that Dutch manufacturers who did not formerly always look for the best and most economical machine are now asking more for quality than for price. German competition against high-class American machines is growing. The German manufacturers copy the best American makes, make them a little more substantial, try to give them good workmanship, and sell them at much lower prices. However, American machine tools are asked for by leading firms in the Netherlands on their good name and reputation. It is regrettable that some American manufacturers are selling poor stuff on the good name of their fellow manufacturers, which hurts the business of the first-class makers.

If American manufacturers want to sell their goods readily in our market, they should take all possible steps to get a stock here for exhibition and sale. They should also study carefully and constantly the situation here in order to keep their share of the business.

## General Exports and Imports.

The following table shows the imports and exports of the principal articles at Rotterdam in 1910 and 1911, in tons of 2,000 pounds:

## Lumber and Timber Imports.

One of the largest importers of American lumber in Rotterdam gives the imports from the United States as 80,333,435 superficial feet of lumber and 25,622,617 superficial feet of timber in 1911. The corresponding figures for 1910 were 73,932,089 and 22,276,102 superficial feet, respectively. Prices in 1911 were steady up until late in the fall, when they increased. As stocks on the Continent have been considerably lowered, there should be numerous transactions as soon

as improved shipping facilities are provided. The following were the prices per standard paid at the end of 1911 (standard=165 cubic feet): Prime lumber, 11-inch and up, \$92; prime lumber, 8, 9, and 10 inch, \$82.50; heart face floorings, 1 by 6 and 1 by 4 inches, \$80; kiln-dried saps, 1 by 6 inches, \$70.50; kiln-dried saps, 1 by 4 inches, \$65.50. Sawn pitch-pine timber sold for \$18.25 per load of 50 cubic feet.

#### Exports to the United States.

The principal exports to the United States during 1910 and 1911, as invoiced at this consulate and its agencies, are shown in the following table:

Cheese to the value of \$170,088 in 1910 and \$194,612 in 1911 made up the total exports from Rotterdam to Porto Rico. The exports declared from this port for the Philippines amounted to \$39,648 in 1910 and \$48,425 in 1911. The principal items in the latter year were: Cheese, \$17,948; earthenware, \$4,178; electric lamps, \$2,787; rubber tires, \$2,010; cedar wood, \$9,784; red Turkish yarn, \$4,706.

#### **New Warehouse and Salesrooms.**

A large office and warehouse building covering an area of 26,666 square feet was erected in 1911 by a prominent importing firm at Rotterdam which does a large business in American goods. It has arranged large, well-lighted showrooms for the American trade, where goods may be displayed, and has provided bonded stores to enable manufacturers to store their goods here for distribution to European points. Rotterdam, with its unique facilities for transporting merchandise to all of Europe by rail and water, is an excellent center for the storage of bonded goods.

#### **Shipping and Shipbuilding.**

The shipping and forwarding interests showed a decided gain in 1911, and Rotterdam maintained its position as second only to Hamburg among the seaports of continental Europe. The arrivals numbered 9,562 vessels, of 18,309,542 tons gross, as against 9,368 vessels, of 17,682,707 tons gross, in 1910. The harbor dues collected in 1911 amounted to \$1,021,200.

The shipyards, which make a specialty of building small vessels for river trade, were busy during the latter months of 1911, and orders for ocean vessels came to the larger establishments so fast that they could not all be filled. Early in March, 1912, there were 20 steamers on the stocks of the Rotterdam shipyards.

The two steamship lines carrying passengers to the United States carried 18,707 cabin and 30,105 steerage passengers in 1911. A new passenger steamer of 32,000 tons has been ordered in Ireland by the Holland-American Line.

The population of Rotterdam on December 31, 1911, was 436,015, an increase for the year of 9,127.

---

### **STIMULATION TO FARM PRODUCTION.**

Secretary of Agriculture Wilson has announced plans to be instituted for farm-management study and work in the North, for which both Houses of Congress have made provision in the agricultural appropriation bill. This plan, on which the Secretary and Dr. B. T. Galloway, Chief of the Bureau of Plant Industry, have been working for several months, corresponds to the cooperative demonstration work in the South. The Federal Government, through its agents, who will act in cooperation with State and local inspectors, proposes to make a comprehensive study of the farms of the country, with a view especially of carrying to the farmer information which will show him why a certain branch of his industry is unprofitable, and how he can make it pay, or, if not, why he should drop that branch. "We will carry the agricultural school to the farmer," said Secretary Wilson. "Ordinarily, only one man in a large number can go to school to study farming. We must take the school to him."

**CONSTRUCTION WORK ABROAD.****JAPAN.**

[From Consul General Thomas Sammons, Yokohama.]

**Improvement of Yokohama Gas Works.**

A \$600,000 loan has been negotiated for improving the municipal gas works at Yokohama. Considerable quantities of iron pipe are being used, and a further supply will be required.

**Application for One Million Electric Lights at Tokyo.**

The Japanese Government has rejected the application of the municipal authorities of Tokyo for permission to increase the capacity of the electric-light department of the city to approximately one million lights. The municipality of Tokyo is now engaged in the lighting business through the ownership of the electric street-railway lines. The Tokyo Asahi states that the reason for rejecting the application is that when the establishment of the Nippon Electric Light Co. came up for approval last year, the Government, after investigation, ascertained that there was ample room for the operations of three companies—the Tokyo Electric Light, the Nippon Electric Light, and the Electric Light Department of the Tokyo Railways (now the Electric Bureau of the Tokyo municipality)—and granted the Nippon Electric Light Co. the right to furnish electric light to the amount of 11,000 kilowatts. If the Government were now to sanction the new scheme of the Tokyo municipality for 17,000 kilowatts (or actually 20,000 kilowatts), despite the fact that there has been no particular increase in the demand for electric light in the city, the grant to the Nippon Electric Light Co. would become meaningless.

**Fireproof Materials for Tokyo.**

Owing to numerous devastating conflagrations, the municipality of Tokyo proposes to enforce regulations requiring fireproof buildings, the same to be constructed of stone, concrete, or brick. In connection with this movement, buildings containing inflammable materials are to be provided with water pipes having fusible heads, such as will be liquified under heat and thereby automatically release the water supply.

---

**MANCHURIA.**

[From Consul Albert W. Pontius, Dalny.]

**Character of City Buildings.**

Private capital invested in buildings in Dairen (Dalny) up to January 1, 1912, totaled \$5,724,000, according to the local Japanese civil administration. This includes 80 brick godowns completed and 32 under construction, the 5-story railway hotel, still building, and 1,369 flat buildings completed and 147 under construction. In brick construction the 1-story flat buildings predominate and were apparently erected at an average cost of \$1,570. The buildings most in favor are evidently those of 2-story construction, the average cost being \$4,200.

The cheapness of the frame structure places that style of building, however, in most common use, although the practice of erecting hundreds of these flimsy and unsightly structures is now beginning

to impress the contractors as being just the opposite from economical. The local frame structures do not in any way compare with the substantial wooden frame buildings in common use in the United States. They are constructed chiefly of lath and plaster, both interior and exterior, and are soon affected by the wind and rain.

Practically all of the residential buildings erected in recent years were designed and constructed by Japanese architects and contractors, and although the buildings are meant to be of foreign pattern, in many cases the impractical interior arrangement leaves much to be desired. Some of the houses have been erected without chimneys, and considering the zero temperature prevailing during the winter months, surprise must be expressed at this apparent oversight. The lack of chimneys or the impractical nature of those installed has the result of making scores of buildings most unsightly in appearance during the cold winter months, as stove pipes have to be stuck out of windows and elevated to a "safe" sky line.

With the exception of the defects mentioned the building operations in Dairen brought to completion are a credit to the many enterprising contractors who have shown great energy in their work of contributing to the construction of a model city.

---

#### MEXICO.

[From Consul Luther T. Ellsworth, Ciudad Porfirio Diaz, the name of which city has been officially changed to Piedras Negras.]

##### **Railway Extension to the Rio Grande.**

The Mexican National Railways have given the grading contract for their Allende Station to Las Vacas line to Señor Marcos Hernandez, manager of the Don Lorenzo Estate. At Las Vacas connection will be made with the St. Louis, Kansas City & Orient Railway, which is being extended to Del Rio, Tex., opposite Las Vacas. Señor Hernandez has started the work. He resides at San Carlos, Coahuila, Mexico, and may be addressed in English or Spanish. The chief engineer of this railway extension has established headquarters at Allende, Coahuila, and will lay the track as rapidly as the grade work is finished.

---

#### CANADA.

##### **Huge Hydroelectric and Water Supply Enterprise.**

It is announced from Toronto that the government of Saskatchewan has made a contract by which the Canadian Pacific, Canadian Northern, and Grand Trunk Pacific Railways will spend \$20,000,000 diverting the South Saskatchewan River to supply water to Regina, Moose Jaw, and Weyburn, and other cities, and also in developing 30,000 electrical horsepower. A commission has been appointed to prepare plans.

---

#### BRAZIL.

[From Consul Southard P. Warner, Bahia.]

##### **City of Bahia to be Improved.**

Elaborate plans for the improvement of Bahia have been drawn up by the municipal authorities here. A broad avenue is to be constructed through the lower, or business portion of the city, and several of the most important streets in the upper city are to be broadened and

improved generally. These improvements will necessitate the demolition of a very large number of old buildings which are to be replaced by more modern structures. The construction of these new buildings will mean a great increase in the importation of building materials and hardware of all sorts, but as there are several foreign firms located here which make a specialty of importing this class of material, whereas not a single American firm of this nature exists here, it is more than probable that the great majority of the forthcoming orders will be placed in Europe.

---

#### ARGENTINA-CHILE.

[From a report by the British Legation at Buenos Aires.]

##### **Proposed Trans-Andine Railway from San Antonio to Valdivia.**

The engineer who has been surveying the country between Port San Antonio (Argentina) and Valdivia (Chile) has reported favorably on the possibility of constructing a Trans-Andine railway connecting these ports. The Government railway under construction from San Antonio to Nahuel Huapi would be used for about 300 miles, 200 miles of which have already been completed, and the line would then proceed for about 60 miles up an easy valley where the Andes are much lower to cross than they are further north.

---

#### ITALY.

[From report of British consul at Syracuse.]

##### **Harbor Works—Building Material.**

Owing to the lack of sufficient wharves and harbor accommodation at Syracuse, and to the increasing traffic as a result of the annexation of Tripoli and Cyrenaica, the Italian Government has under consideration a project and estimates for the carrying out of extensive harbor improvements, and the construction of a new railway station, customhouse, and post office for sorting letters, etc., arriving at Syracuse from Tripoli. There are also projects for harbor improvements at the port of Augusta, and during the year 1911 a large area of land near the wharf was leveled to be utilized as a depot for coal.

---

#### NETHERLANDS.

[From Consul Frank W. Mahin, Amsterdam, Netherlands.]

##### **Increased Dry-Dock Facilities at Amsterdam.**

During the last two years the dry-dock facilities of Amsterdam's harbor have been materially increased to accommodate the greater number and growing size of the ships using this port. But even this enlargement is now found to be insufficient, and the Amsterdam Dry Dock Co. is accordingly planning further extensions. A fifth dry dock is to be added to the four now in use; and the Juliana Dock, only beginning service last year, is to be lengthened from 460 feet to 600 feet and broadened in proportion and have a berthing capacity for vessels of 16,000 tons instead of 12,000 as at present.

---

#### AUSTRIA.

[From Consul J. I. Brittain, Prague, Bohemia.]

##### **Building Material for Prague.**

Many of the bricks used in Prague are yet made by hand, both women and men working in the yards. Practically all the buildings are constructed of brick and plastered on the outside. The bricks are larger than those commonly used in the United States and not so well finished, not being used for facing the outside walls. The ordi-

nary building bricks sell at about \$8 per thousand. Many new buildings are being erected, which makes the brick business one of the best in the city. Large quantities of brick and stone are brought to Prague from points up the River Moldau, as labor is not so well paid in these more distant villages. [The names of the leading architects and the brick makers of Prague may be had from the Bureau of Manufactures at Washington.]

---

### BRITISH INDUSTRIAL NOTES.

[From Consul Benjamin F. Chase, Leeds.]

#### Farthings to Reduce Cost of Living.

A local newspaper, in commenting on an experiment of considerable interest to students of the cost-of-living problem, whereby an attempt is being made to introduce the farthing (one-half cent in value) into general circulation, says:

Mr. Robert Armitage, M. P., managing director of the Farnley Iron Co. (Ltd.), has conceived the idea that if the farthing were more generally used the cost of living would be considerably reduced to the working classes. Briefly, his argument is this: People of the poorer classes buy their goods in small quantities. If an article is 19 cents a pound, they have to pay 10 cents for half a pound; consequently, they are overcharged to the extent of 1 cent on every two half-pounds they buy. In the same way 4 cents has to be paid for half an ounce of 7-cent tobacco, and 2 cents for a gill of milk when the price is 3 cents per pint. It is fairly clear, therefore, that if farthings were used there would be a considerable saving to the purchaser in the course of a year.

By way of experiment, Mr. Armitage has arranged that a portion of the wages of every man employed at the iron works shall be paid in farthings each week, in order to get the coins into circulation in the district.

#### Improper Use of Cloth Patterns.

The Yorkshire Post is authority for the statement that a circular addressed to the principal woolen merchants in Great Britain and on the Continent has been issued by the Fine Cloth Manufacturers' Association of Huddersfield, Leeds, Bradford, and Halifax, together with the Scottish Manufacturers' Association, setting forth that the interests of both merchants and manufacturers have suffered considerable loss from the misuse of patterns which have frequently been obtained by competitors and pattern dealers shortly after their production and before the pieces have been manufactured and delivered. The journal referred to states:

The associations are convinced that it is essential, in order to protect the makers and dealers in fine British cloths from this evil, that a trade custom should be universally acknowledged that all patterns sold or submitted to any merchant or tailor are manufacturers' and merchants' trade secrets until the goods are delivered to the merchant, and must be treated as such. On the best legal advice obtainable the associations consider that once a trade custom is established, it would be easier to prevent and punish the misuse of patterns.

---

*The over-sea trade* of New Castle, New South Wales, for the quarter ended March 31, 1912, according to Consul G. B. Killmaster, of that Australian port, amounted to \$3,744,196, compared with \$3,560,647 during the first three months of 1911. Over-sea imports aggregated \$1,102,641, against \$1,100,855 in 1911, and over-sea exports totaled \$2,641,555, in contrast to \$2,459,792 in the previous year. Coal formed nearly the whole of the past quarter's shipments, having a value of \$2,572,520, against \$2,033,395 in the first quarter of 1911.

**FOREIGN TARIFFS.****ARGENTINA.**

[From Boletín Oficial, Argentina, Mar. 13, 1912.]

**Regulations for Customs Storage.**

When goods imported through the customhouses of Argentina remain more than four months in the customs storage they shall be subject to an extra charge of 50 per cent of the regular storage rates; after eight months this extra charge will be 100 per cent of the regular storage rates. The period for which goods may be entered in the customs storage is one year from the date of the entrance of the vessel on which they arrive; on special request presented before the end of the one-year period the limit for the customs storage of the goods may be extended for another year. Goods, the subject of dispute before the customs or judicial authorities, are not affected by the above provisions.

When the period for which the storage may be allowed has expired the customs will not only not be responsible for loss or damage of goods, but they will demand the payment of all charges that may be due on such goods, regardless of their condition at the time. At the expiration of the time for which customs storage is allowed, goods will be disposed of at public sale, and from the proceeds of the sale all charges that may be due on the goods will be deducted; any surplus that may remain will be at the order of the owners or consignees of the goods for a period of one year, at the end of which time it shall become forfeit to the treasury.

---

**CHILE.**

[From Consul Charles L. Latham, Punta Arenas.]

**Consular Invoices for Shipments to Punta Arenas.**

Care should be taken by exporters and shipping companies to provide all shipments to Punta Arenas, Chile, with formal Chilean consular invoices. This requirement is important because of the tariff law providing for customs duties upon certain classes of goods when introduced into Magallanes Territory and establishing a customhouse in this port.

Until April 13, 1912, the date upon which this law became effective, imports into Punta Arenas and Magallanes Territory were entirely free of customs duties.

---

**CUBA.**

[Gaceta Oficial, Cuba, Apr. 30, 1912.]

**New Regulations for Explosives, Arms, and Ammunition.**

By a decree of April 24, 1912, there were established new regulations for the manufacture, storage, transportation, importation, sale, and use of explosives, arms, and ammunition in Cuba. These regulations take effect 30 days from the date of publication. [A copy of the new regulations, in Spanish, is on file in the Bureau of Manufactures.]

---

**JAMAICA.**

[From Consul Nicholas R. Snyder, Kingston.]

**Reduction of Customs Duties.**

The rate of the customs duty for articles not specially provided for in the tariff of Jamaica has been reduced from 16½ per cent ad valorem

to 10 per cent ad valorem, the reduced rate to go into effect July 1, 1912. Among the principal articles affected by the reduction are dry goods, boots and shoes, hardware, and drugs.

[From Consul Julius D. Dreher, Port Antonio.]

#### **Revenues and Tariff Reduction.**

As the Jamaican revenues, which have exceeded the necessary expenditures for several years [for 1910 report see Daily Consular and Trade Reports, Jan. 10, 1912], increased to a little more than \$5,000,000 for the last fiscal year, and as the condition of the colony seems to assure the collection of fully as much, if not more, revenue in each succeeding year, the Government felt that the time had come to reduce the customs duties. It was estimated that after meeting all regular expenditures and setting aside \$500,000 (in round numbers) for the maintenance of main roads and bridges, and as much more for new roads, bridges, and schools, there would still remain in the colonial treasury a surplus of \$783,500 for the current fiscal year. The Government accordingly proposed to the Legislative Council that the customs duties be so reduced as to yield about \$400,000 less a year, and that this should be effected by reducing the duty on flour from \$1.94, which is an average of about 40 per cent ad valorem, to 97 cents a barrel; on rice from 73 cents, an average of about 30 per cent ad valorem, to 48 cents a hundred pounds; and on bread and biscuits from \$1.01, an average of about 25 per cent ad valorem, to 81 cents a hundred pounds, thus making an average duty equivalent to about 20 per cent ad valorem on these three important articles of food; and it was further recommended by the Government that the present ad valorem duty of 16½ per cent be reduced to 12½ per cent.

The Legislative Council of Jamaica, which is composed of the Governor, as presiding officer, 5 ex officio, 10 nominated, and 14 elected members (1 for each of the 14 parishes), discussed for two days the proposals for the reduction of the tariff. Under the constitution of the colony 9 elected members may defeat a strictly financial measure; in this case the elected members voted almost unanimously against the reduction of the duty on flour, rice, and biscuits (crackers). These members took the position that there was no popular demand for reducing the duties on these articles of food, which are not in general use throughout the island, and that such a reduction would result in lessening the attention paid by the natives to their crops of "ground provisions" (chiefly yams and potatoes), on which the people depend mostly for food. To show that they were in favor of tariff reduction these members then proceeded to vote to reduce the ad valorem duty from 16½ per cent to 10 per cent, instead of to 12½ per cent as recommended by the Government. This reduction is to take effect on July 1, 1912.

#### **Principal Articles Affected.**

The chief articles on which only 10 per cent ad valorem duty will be paid after July 1, 1912, are as follows: Automobiles and motor cars; brass and copper goods; books (not printed); brick; bicycles; canned meats, fish, fruits, and vegetables; carriages, wagons, etc.; chemical products; clocks and watches; clothing; cotton, linen, silk, woolen, and worsted goods; hosiery, haberdashery, millinery, etc.;

cottonseed and prepared food for animals; confectionery; cordage, twine, etc.; farinaceous foods; firearms and ammunition; fresh meats, fish, and vegetables; fruits, fresh, preserved, and dried; furniture, of wood or metal; galvanized-iron roofing; glass, china, and earthen ware; gold and silver plated and gilt ware; hardware and cutlery; hats, felt and straw; hides; hops; iron and steel bars and manufactures of iron and steel generally; jewelry; lamps and lanterns; leather and leather goods, saddlery, harness, etc.; lime; medicines, drugs, etc.; musical instruments; molasses; paints and colors; perfumery; pickles and condiments; pictures; printing presses, type, etc.; pumps; rubber goods; scientific and surgical apparatus; shoes, boots, etc.; steam engines (not for agricultural purposes); tallow and animal greases; tin and zinc plates and sheets; turpentine; umbrellas; wall papering; writing paper, stationery, etc.; and wire.

While it is to be regretted that the Legislative Council failed to reduce the high duty on flour, it seems almost certain that the large reduction in the ad valorem rate of duty on so many important articles will be conducive to the increase of American trade with Jamaica. With Jamaica the United States has been doing an increasing import and export business for years. The official statistics for 1910 (the latest available) show that for that year the United States furnished 45 per cent of the total imports into Jamaica and received 54 per cent of the total exports from the island. With such intimate business relations with the States it is not probable that this colony will seriously consider the question of entering into a reciprocal trade agreement with Canada. Jamaica was not represented at the recent trade conference at Ottawa, and the question of reciprocity with Canada did not enter into the discussion of the proposals to reduce the customs duty in the session of the Legislative Council of Jamaica just closed.

---

#### RUSSIA.

[From Consul General John H. Snodgrass, Moscow.]

#### Government Assistance for Agricultural Machinery Industry.

The finance committee of the Imperial Council of Russia, after consideration of the projects for the change in some of the tariff rates on agricultural machinery and implements passed by the Duma, adopted the following resolutions: "The proposal of the finance committee of the Duma regarding the free importation of lathes for the equipment of works for the manufacture of the kind of agricultural machinery which may be imported free of duty is accepted; the proposal that spare parts for agricultural machinery should be admitted at reduced rates only when imported together with the machinery, and not when imported separately, is accepted."

The last question under discussion related to encouraging the manufacture of agricultural machinery in Russia by means of bounties. The committee decided to establish the following bounties: For the construction of traction engines, 1.25 rubles per pood (\$1.78 per 100 pounds); for the construction of complicated steam-driven thrashing machines, harvesting machinery, and binders, a bounty of 1 ruble per pood (\$1.43 per 100 pounds). [See Daily Consular and Trade Reports for Apr. 23, 1912.]

**SALVADOR.**

[From Diario Oficial, Salvador, Apr. 29, 1912.]

**Extension of Surtax.**

The legislature of Salvador has approved in part the Executive decree of September 19, 1911, by which the surtax of 20 per cent which had been previously created was reduced to 14 per cent. A feature of the Executive decree of September 19, 1911, was that the surtax was declared not to apply to flour and to materials for the manufacture of soap and candles. This exception the legislature has now done away with, providing that "this surtax shall be made to extend to those articles to which it was not formerly applicable." [See Foreign Tariff Notes, No. 4, p. 111.]

**SWEDEN.****Reduction of Duty on Pork.**

American Minister Charles H. Graves, at Stockholm, has reported that the Swedish Parliament has reduced the tariff on cured pork of all classes 40 per cent, thus making the present rate 4.8 cents per kilo, or 2.2 cents per pound. The former rate was 8.04 cents per kilo, or 3.65 cents per pound.

**WHAT PARIS PAYS FOR PUBLIC AMUSEMENTS.**

[From Consul General Frank H. Mason, Paris, France.]

There are in Paris four theaters (the Comédie Française, Odéon, the Opéra, and Opéra Comique) which receive subventions from the Government, and 40 regular theaters, among which are included the Châtelet, Gymnase, Gaîté, and Palais Royal, which receive no subvention. There are besides 12 large cinematograph theaters, 38 café concerts, 8 music halls, 10 skating rinks, velodromes, and circuses, among which are included the Magic City and Luna Park, both originally American enterprises; 6 permanent balls or dancing places, including the Bal Tabarin, Bullier, and Moulin Rouge; and finally 3 classical concerts, viz, the Concert Lamoureux, Colonne, and the Conservatoire; in all 121 regular places of amusement.

From the report of the municipal administration for 1911 it appears that the total receipts collected during that year by these various groups of theaters, etc., were as follows: The 4 subventioned theaters, \$1,839,438; 40 theaters of the Gaîté class, \$4,538,659; cinematographs, \$541,097; museums and expositions, \$123,361; café concerts, \$1,330,752; music halls, \$1,366,257; skating rinks, circuses, etc., \$840,287; balls, \$189,714; artistic concerts, \$114,373; various other concerts, \$457,221; total, \$11,341,159.

For the support of the poor (droits des pauvres), the municipality collects a uniform tax of 10 per cent of the gross receipts of regular theaters and daily concerts, 5 per cent of the receipts from casual concerts given by artists or musical associations, and 25 per cent of the receipts of balls, races, and certain other amusements. The total revenue thus derived for the poor fund in 1911 was \$1,225,013.

The steady growth of Paris and the devotion of its people and the constant throng of foreign visitors to theatrical and musical entertainments are shown by the fact that the receipts of 1911 from these sources exceeded those of any previous year, not excepting even the years 1878, 1889, and 1900, when international expositions of world wide interest were held in Paris.

**TRADE OF CANARY ISLANDS.**

[By Consul W. W. Kitchen, Tenerife.]

The year 1911 was a notable one in the Canary Islands because of the number of improvements in various lines. Work on the mole, or Government breakwater, was continued, 80 meters left over from 1910 being completed and 32 additional meters being built. This structure, begun soon after the arrival of the Spaniards in the fifteenth century, has been since then the greatest single source of expense to the Government and the municipality because of the frequent damage caused by storms. Until the present century it was a comparatively small affair. It has been gradually extended, however, and when completed will have a length of 2 miles and form a closed basin for the harboring of about 50 of the deepest-draft vessels. About half of this length has already been completed. The work requires a considerable degree of engineering skill, the mole being built of huge cement blocks, with a 12-foot edge and a beveled incline to the sea.

**Cable Services of Canaries.**

The past year saw an improvement in the service of the German-South American Cable Co., partly perhaps because of the completion of the new wireless company. The various cables from the Canary Islands have been laid since 1884. In that year the Spanish National Submarine Cable Telegraph Co. obtained a 10-year concession from the Spanish Government to lay the first island cables between Cadiz and Tenerife (860 miles), Tenerife and Las Palmas (57 miles), Tenerife and La Palma (69 miles), and Las Palmas and Arecife, Lanzarote (164 miles). Upon the expiration of this concession the Spanish Government took the lines over, and has since worked them through a Government staff. In 1908 new cables between all these points were laid to replace the old lines. In 1885 an English company laid a cable from Tenerife to St. Louis, Senegal (896 miles), under a 15-year concession from the Spanish and French Governments in agreement. Upon the expiration of this concession the company dissolved, after previously handing over the cables to the French Government, which subsequently transferred its holdings to the South American Cable Co. (Ltd.), to be used as an extension to its regular system from Pernambuco to Dakar. The St. Louis station thereupon was closed and the terminus of the old Tenerife line moved to Dakar. Messages for Europe and North America by this cable go via the Dakar-Brest cable now.

In 1909 the German-South American Telegraph Co. laid a cable under a 50-year contract with the Spanish Government, assisted by liberal German governmental support, between Tenerife and Emden, and in 1910 another cable between Tenerife and Monrovia, Liberia. The latter has since been extended from Monrovia to Pernambuco.

The rates per word to Europe or North America by the German-South American Co. and by the Government cable are practically the same.

**New Wireless Company—Road Improvements.**

The Marconi Wireless Co. has completed and put into operation its installation, after a considerable delay in fulfilling the stipulations of the Spanish Government. While this company will compete with the cable company, there is no anticipation of war between them.

Where similar service can be performed by each the rates are similar. The four towers are each 185 feet high.

Considerable money was spent last year in road improvements, but their condition still leaves much to be desired. A road from Teneriffe to Laguna is in first-class repair and is being improved still further and extended to Buena Vista. A branch of this road runs to the towns of Guimar and Tasnia, in the southern end of the island, and will probably be carried around the island. The best road on the island runs from Laguna to Tegueste and Tejina, 5 and 9 miles, respectively, connecting with the road from Tejina to Tacaronte. There is also a fair road, built at enormous expense because of the blasting necessary, between Teneriffe and San Andres, a distance of about 6 miles. If the proposed railroad around the island should become a reality, it would utilize a fair proportion of the roads mentioned.

#### **Tree Planting—Building Boom.**

In the last year or two 8,000 trees have been planted in this vicinity, at a total cost averaging 50 centesimos (9 cents) each. A great many of these were planted at a cost of about 1 cent each, while about 100 cost as much as \$30 each, being planted in holes 10 feet deep and 5 feet in diameter blasted out of the solid volcanic rock.

There has been a considerable boom in building in this city, both in public and private structures, the most important of the former being the combined museum and art school. This is of stone, two stories in height, and cost \$100,000. About 100 modern, sanitary residences have been built and are in great demand and a boulevard was begun in 1911, along which several trees were planted. The first horse-drawn street sprinkler recently made its appearance here, having been imported from England.

The discovery of water in the hills of Las Mercedes at a height of about 2,500 feet made possible the establishment of a pressure system. The water is brought to large reservoirs outside the city and distributed through meters at a very reasonable cost.

#### **Public-Service Corporations.**

The local telephone company, which is Swedish, is considering the installation of a new and modern system. The present line runs from Teneriffe to Laguna and Tacaronte, with about 300 subscribers on the books in Teneriffe and 100 in Laguna.

Transportation is afforded locally by a single tram line and by old-fashioned cab, the rates being very reasonable, though the service is slow. There has recently been inaugurated a public automobile service, which at the low rates charged is so popular that the number of cars is not equal to the demand. The tram company was recently affiliated under the name of *Compañia Electrica Industrial de Teneriffe*, with the electric-light company, which a short time ago extended its service to Laguna and now supplies the light for both cities from a greatly enlarged and modern plant, completed in 1911. Electricity is used almost exclusively for lighting except by the poorer people, though the wealthier people living in the country houses have their own acetylene-gas machines.

#### **Conditions in Import and Export Trade.**

No exact figures on the total value of the foreign trade of the Canaries are obtainable, but the estimated 1910 total of about

\$20,000,000 was not materially increased in 1911. The exports exceeded the imports by about 15 per cent, Great Britain taking about 85 per cent of them, Germany, France, and Spain together 10 per cent, and the United States, Porto Rico, Cuba, and Italy the remainder. Great Britain also furnishes 80 to 85 per cent of the imports, which consist largely of manufactured articles and food-stuffs. Increases were noted last year in hardware, glassware, gasoline, petroleum, and tobacco leaf, but beer and lumber have fallen off. The proportion of the trade in these two articles enjoyed by the United States has declined largely, perhaps because of the better shipping facilities of Germany and Norway.

The principal imports into the port of Tenerife and the principal countries from which they came were as follows:

Articles.	Germany.	Great Britain.	United States.	Total, 1911.	Total, 1910.
Alcohol.....gallons..	37,662	783	.....	110,551	76,312

This table does not include coal, which is imported in large quantities for coaling the vessels calling here.

The principal export of the islands is bananas. The following table shows the amounts of bananas, tomatoes, and potatoes exported in 1910 and 1911:

Articles.	1910		1911	
	Quantity.	Value.	Quantity.	Value.
Bananas.....crates..	2,700,352	\$3,780,492	2,648,378	\$3,972,567
Tomatoes.....bundles..	1,013,806	2,027,612	991,047	1,982,094
Potatoes.....boxes..	384,703	336,616	506,032	454,278

#### Trade with United States and Porto Rico.

Most of the imports from the United States, even since the establishment of direct steamship service, come by way of Liverpool or Hamburg. For this reason there is a greater import trade in American goods than is apparent on the surface. The variety is surprisingly large, ranging from very minor articles to agricultural machinery. American articles for which a certain market exists here include flour,

soap and perfume, sugar, automobiles, stationary engines, confectionery, biscuits and crackers, boots and shoes, furniture, corsets, haberdashery, hardware, plumbing materials, cash registers, stationery, and patented novelties. This consulate desires to obtain a good supply of literature and catalogues (preferably printed in Spanish) in all these lines, and samples could also in many cases be put to good use.

Declared exports to the United States and Porto Rico from Teneriffe in 1910 and 1911 were as follows:

Articles.	1910		1911	
	Pounds.	Value.	Pounds.	Value.
<b>UNITED STATES.</b>				
Almonds.....				\$1,110
Cochineal.....	16,990	\$4,668	16,577	2,813
Dollies.....		708		285
Drawn work.....		4,732		1,294
Embroidered linen.....		314		
Household goods.....		3,000		
Onion seed.....	36,471	\$5,984	32,506	30,733
Pumice stone.....	88,029	1,384	77,852	1,557
Total.....	141,499	50,800	127,100	37,812
<b>PORTO RICO.</b>				
Almonds.....			1,032	174
Garlic.....	3,300	111		
Onions.....	220,385	2,968	286,238	6,139
Onion seed.....	734	511	2,193	1,504
Potatoes.....	276,382	2,099	850,985	20,902
Umbrellas.....		570		1,560
Waterproofs.....		542		752
Total.....	500,801	6,786	1,140,458	31,123

From Las Palmas the declared exports to the United States consisted of almonds \$881, and cochineal \$23,672, with \$344 worth of returned American goods. To Porto Rico the declared exports amounted to \$30,769, as compared with \$15,009 in 1910, and were made up of garlic, \$348; onions, \$19,118; potatoes, \$6,489; stone fillers, \$88; and umbrellas, \$4,725.

#### Coaling Ships Most Important Industry—Shipping Figures.

The industry connected with shipping is by far the most important on the islands. At the two principal seaports, Teneriffe and Las Palmas, thousands of steamers and sailing vessels, with tonnage running into the millions, call annually to discharge and load cargo, and with the completion of the Panama Canal this traffic is likely to increase immediately.

Las Palmas has six and Teneriffe four coaling firms, all English but one. Some of these have been represented here for the greater part of a century. The total sailing and steam vessels entering the ports of Teneriffe and Las Palmas in 1910 and 1911 were as follows:

Ports.	1910		1911	
	Number.	Tonnage.	Number.	Tonnage.
Las Palmas.....	6,170	9,230,974	6,460	13,401,568
Teneriffe.....	3,681	6,424,046	3,700	7,137,487
Total.....	9,851	15,655,020	10,160	20,539,055

These figures indicate that Teneriffe, the capital and social center, is not the most important port commercially. Although there is a fine harbor there, which does not have to be dredged like the one at Las Palmas, it is not so well protected against the sea, and the mole has to be continually repaired. The nationality of the ships entering the port of Teneriffe in 1911 was as follows:

Nationality.	Number.	Tonnage.	Nationality.	Number.	Tonnage.
Belgium.....	56	298,472	Spain.....	2,256	1,061,251
France.....	156	539,392	United States.....	1	1,000
Germany.....	410	1,760,897	Other countries.....	■	62,366
Great Britain.....	698	3,067,206			
Italy.....	39	132,028	Total.....	3,790	7,127,487
Norway.....	140	304,865			

The entire coal supply for these ships, except a small quantity brought from Germany, was imported from the Welsh mines.

#### Emigration Continues.

The past year saw a continuation of the heavy emigration of 1910, chiefly of the most sober and thrifty working class. This is due largely to low wages, aggravated in the island of Hiero last year by the drought. Although the Government at Madrid took measures to relieve the distress, it was unable to do so, and the exodus continued. From Teneriffe a total of 3,671 people emigrated, as compared with 3,474 in 1910, 3,081 going to Cuba and 399 to Argentina. The emigration of all the other islands is estimated to have been about the same as for Teneriffe alone.

### MEXICAN BUSINESS NOTES.

[From the Daily Herald, Mexico City.]

**Salt mining.**—The Department of Fomento has entered into a contract with Rali Moreno giving him a concession to work the Navidad salt pits in Jalisco at a fixed rental.

**Sinaloa's new capital.**—It was officially stated at the Ministry of Gobernacion that the capital of the State of Sinaloa will be removed to-day (May 21) from Culiacan to Mazatlan.

**Proposed Railway.**—The Mexican Construction Co. has applied to the Department of Communications for a concession to construct a railway from Pachuca to Netzitlan, opening up a large district in northern Hidalgo, which now lacks means of rapid communication.

**Wheat imports.**—The British steamer *Cape Antibes* on May 20 arrived at Vera Cruz from Buenos Aires with a cargo of wheat, consisting of 89,000 bags, weighing 5,000 metric tons, which was discharged at the big stone pier direct into cars for transportation to the interior, the greater part being consigned to the flour mills in Puebla and other places in that vicinity. While the barley crop was very heavy this season in the Puebla district, the wheat harvest was almost a total failure.

### WATER AND COAL AT PANAMA.

[Announcement of Isthmian Canal Commission.]

The Panama Railroad Co. has discontinued supplying water to vessels at Balboa, Colon, and Cristobal except in quantities that may be needed to reach the next port, and has notified the steamship companies that it may become necessary to stop supplying any water at all. The sale of coal, which was discontinued on account of the strike of bituminous workers, has been resumed.

**HOP GROWING IN ITALY FOR BREWERIES.**

[From Consul General James A. Smith, Genoa.]

Experiments in culture of hops have been conducted in Umbria, Italy, the past four years, and official reports state that the results are successful. This is important, since Italy is dependent on other countries for hops, importing in 1911 582,520 pounds, valued at \$211,700; in 1910, 326,260 pounds, valued at \$114,488; and in 1909 over 733,000 pounds, valued at \$283,220. The consumption of beer in Italy is said to be almost 26,000,000 gallons a year. Beer imports in 1911 were over 2,500,000 gallons.

Hops were planted on 1½ acres of alluvial soil, about 990 feet above sea level, at Orvieto, Umbria, near the Paglia River, in March, 1908. The outcome was so favorable that the experiments were continued and are now in the fifth year. The soil is fertile and adapted to hemp growing.

Studies had been made of hop cultivation in Belgium, Germany, and Austria, and previous experiments had been tried on a small scale in Italy at the Royal School of Agriculture at Brusegana and at Macerata, with about 100 samples of hops at each school. These results were also favorable.

**Favorable Results Attained.**

In the recent experiments at Orvieto hop plants were imported from Popperinge, Belgium, and the indigenous hop of Italy was also used and shown to be adaptable for beer. The first year's results were satisfactory, and the hops obtained were passed upon by experts as of commercial value. The Versuchsanstalt für Brauerei, of Berlin, pronounced the product satisfactory as to floral cones, aroma, and strength. The only unfavorable comment made by reports is that the hop scales were yellow and partly chestnut colored, while the best hops of commerce have a uniform pale-green color.

Particularly interesting to brewers in Italy are the results obtained from experiments with the indigenous hop. Tests were made with the Italian hop, both alone and crossed with the foreign variety. At a near-by brewery, Ditta Sanvici e Dell'Orso e Co., of Perugia, beer of the Pilsen type, brewed from indigenous hops crossed with foreign hops, resulted no less successfully than that prepared from foreign hops alone. Official reports to the Italian Minister of Agriculture state that it has been demonstrated that the indigenous hop can be used for beer and that it possesses intrinsic qualities more valuable than would be expected from its exterior appearance.

**Experiments on Table-Lands.**

On account of the difference in the climate of the hop-raising regions of other States in Europe from that of Orvieto, where the experiments were conducted, new crops of hops were planted in Italy, where the climate more nearly corresponds with that of other hop-raising regions. Thus, hops were grown on the table-land of Alfina, between Orvieto and the basin of the Bolsena, at a height of 1,650 feet above sea level. Here the ground is of a volcanic nature.

The distance between the rows of planted hops was reduced to 4.95 feet. Last year 200 cuttings of the hops of the Popperinge variety, which had thrived best at Orvieto, were planted at Alfina. In addition, hop cuttings from Prague were planted.

In spite of the unusually dry and warm season last year, the hops in Alfina thrived, especially those transplanted from Orvieto, which flowered unusually well, with uniform development and rich hop content. Hop growing on the Alfina table-land proved more successful than at Orvieto. Experiments are to be continued in both places this year.

At Orvieto the second and third year crops on the 1½ acres netted 330 pounds, which were sold at \$86.85. The annual expense for the 1½ acres is about \$135.10 or \$270.20 per hectare (2.47 acres). An average crop of 1,323 pounds is counted on, and at \$57.90 per quintal (220.46 pounds), it is figured that \$347.40 per hectare would be received from the sale of the product, so that a profit of \$77.20 would be made on a hectare. These figures represent the estimates for the fifth season of experiment.

The commission conducting the experiments, in summing up the experiments for the Minister of Agriculture, shows that the indigenous hop possesses qualities desired by the brewing industry of Italy. A gold medal has been conferred on the conductor of the experiments, Dr. Claudio Faino. It is now expected that experiments will be carried on with barley in an effort to supply malt for the Italian brewing industry.

---

### EUROPEAN PEAT EXPERIMENTS.

[From Consul General Ernest L. Harris, Stockholm, Sweden.]

The problem of making Sweden independent of foreign coal has lately been receiving much attention, and experiments have been made with peat from bogs in northern Sweden. The peat was permitted to dry for one summer and then crushed to a fine powder. This is further dried in ovens containing several sections, the hottest section being on top. Heating requires 20 minutes, which makes the pulverized peat black and reduces the water content to 15 per cent. The ovens have a capacity of 25 tons daily, and are fired with the powder, which sells at the factory for \$2.27 per ton. It may also be used for boilers, and the State railway authorities are experimenting with it. Generally, however, the tests have not proved satisfactory from an economic and business point.

[The United States Bureau of Mines has issued a comprehensive 240-page book on "The Uses of Peat," which contains a large map showing the deposits of peat, etc. Copies may be had free on application to the Bureau of Mines, Washington, D. C.]

[From the London Times.]

### British Invention for Utilization of Peat.

A new process for the utilization of peat, invented by F. H. Nixon, of London, consists of cutting the turf, after it has been air dried, into corrugated blocks, which are sprayed with petroleum so as to form firelighters. The blocks are subsequently given a coating of highly inflammable material which also strengthens them and prevents them from breaking easily. It is claimed that this process overcomes the obstacles associated hitherto with the combination of peat and petroleum which have been connected mainly with the employment of a briquetting machine that is not only difficult to work, but also expresses too much of the petroleum from the finished blocks. It is stated that the process enables the firelighters to be produced at a cost which has not been approached before. It is proposed also to employ the method for the production of fuel on a larger scale.

### THE QUININE SITUATION.

"For the first time in more than three years domestic manufacturers of quinine salts have decided to advance their quotations from the seemingly stereotyped bulk basis of 14 cents per ounce," states the Oil, Paint, and Drug Reporter in its April 15 issue. In a later number this journal reviews the quinine situation as follows:

As a very firm undertone had been noted in the principal markets for cinchona bark since the auction held on March 28, no surprise was manifested at the news that bark sales from Java to Europe for April amounted to only 872,000 Dutch pounds (Dutch pound=1.09 pounds avoirdupois), or at the result of the bark auctions held May 2 when a price unit was reached more than 1 cent above that obtained at the previous sale. As this new unit showed an uplift of about 30 per cent, a corresponding advance in prices of the salts was immediately looked for.

This commensurate marking up of quotations on the salts carried the first hands' price on sulphate and bisulphate to a basis of 19½ cents in 100-ounce tins and raised that on 50-ounce tins to 20 cents. Quotations on other packages were similarly advanced to 20½ cents for 25-ounce tins, 21½ cents for 5-ounce tins, and 24½ cents for 1-ounce tins. Prices asked by the manufacturers for the alkaloids and minor salts were also raised proportionately, and in some instances domestic manufacturers are now offering 60-day contracts with protection against decline. As it is now evident that shipments of the bark from Java are being curtailed by a group of Dutch interests, still further advances in prices of the bark and salts are expected within the near future. As yet, however, quotations on cinchona sulphate and on cinchonidia sulphate have been left unchanged at 5 cents and 10 cents, respectively.

#### Java's Monthly Shipments to Europe.

Bark shipments from Java to Europe for April were 60,000 Dutch pounds more than those for March but 50,000 pounds under those for February. A basis for comparison is furnished by the following summary of monthly shipments:

Month.	Quantity, in Dutch pounds.			
	1909	1910	1911	1912
January.....	1,021,000	1,167,000	1,421,000	638,000
February.....	1,061,000	900,000	946,000	922,000
March.....	845,000	1,376,000	1,493,000	812,000
April.....	1,279,000	1,578,000	1,037,000	872,000
May.....	1,310,000	1,368,000	1,450,000	
June.....	992,000	2,348,000	1,516,000	
July.....	1,728,000	1,642,000	942,000	
August.....	1,420,000	1,849,000	1,728,000	
September.....	2,016,000	1,814,000	1,772,000	
October.....	1,360,000	1,064,000	1,534,000	
November.....	1,104,000	1,590,000	1,588,000	
December.....	1,345,000	1,357,000	1,188,000	

Some conception of the extent of the falling off in shipments from Java since the outset of 1912 is obtainable from the fact that shipments for the first four months of this year reached only 3,244,000 Dutch pounds, compared with 4,897,000 pounds for the corresponding period of 1911; 5,029,000 pounds in 1910; and 4,206,000 pounds in 1909.

At the London bark auctions held May 21 an advance of 1s. 8d. was recorded, the new unit being 7s. 8d. as compared with an average price of 4d. obtained at the previous sale and with the unit of 9s. 16d. which had been in force for more than two years prior to April 23.

### DECREASING AMERICAN USE OF QUININE.

[Review by Bureau of Statistics, Department of Commerce and Labor.]

While quinine has long been a staple product of importation into this country, no marked growth in its imports has occurred in the last quarter of a century. In 1882, for example, over 5 million pounds of cinchona bark were imported; in 1892, 3½ million pounds; in 1902, 3¼ million pounds; and in 1912 the imports will probably be about 3¼ million pounds. In 1882 the imports of quinine and the various salts of

quinine amounted to 795,000 ounces; in 1884, 1½ million ounces; in 1892, 2½ million ounces; in 1902, 2½ million ounces; in 1906, 4½ million ounces; and in 1911, 3½ million ounces; while the rate of importation in the 9 months of the current fiscal year for which figures are at hand point to a total of about 3 million ounces in the 12 months ending with June.

The decrease in imports of quinine, despite the growth in population meantime, is ascribed to a variety of causes. The drainage of swampy districts, the better screening of homes, and the discovery of the relation between mosquitoes and fevers generally, have had a large part in reducing the prevalence of diseases for which quinine was and is still largely prescribed, while the development of the chemical industry has brought into use a number of coal tar and other preparations which share with quinine its popularity as a remedy of fevers and as a general tonic in professional and domestic practice.

#### Sources of Imports.

Cinchona, or Peruvian bark, is the generic name of a number of trees indigenous to Peru, Ecuador, and Bolivia, formerly the chief producers of that article. In the seventeenth century, however, it was first imported into Europe, where its value was quickly recognized and its use largely extended. Later the cinchona tree was transplanted from South America to Java, India, Ceylon, and certain other countries and its cultivation developed until Java and the British East Indies have become the world's chief producers of cinchona bark. With this development of its culture in the Orient has come a marked change in the source of the cinchona bark imported into the United States in the last 30 years. In 1882, when the annual imports exceeded 5 million pounds, nearly 3 million pounds were imported from Colombia, 1½ million pounds from England, about 600,000 pounds from South America, exclusive of Colombia, 106,000 pounds from Mexico, and smaller quantities from the British West Indies, the British East Indies, Central American States, France, Germany, and the Dutch West Indies. In more recent years, however, Netherlands is nominally the source of practically all the cinchona and other quinine-bearing barks imported. In the fiscal year 1911 the total imports of the class named were 3,826,000 pounds, of which 3,769,000 pounds were stated as from Netherlands, nearly 38,000 from Germany, and the remaining 19,000 pounds from England. Presumably a large part of the cinchona imported from Netherlands is originally from Java, whose exports of that article, chiefly to Netherlands, amounted to 18 million pounds in 1910.

Germany is the chief source of the quinia and the various salts extracted from cinchona bark imported into the United States. Of the 3,219,000 ounces imported in the fiscal year 1911, 1,958,000 ounces came from Germany, 946,000 ounces from Netherlands, 207,000 ounces from the Dutch East Indies, 83,000 ounces from England, and 25,000 ounces from France.

---

#### PREVENTING SHORT-PAID POSTAGE.

In connection with reports on short-paid postage, which have appeared from time to time in Daily Consular and Trade Reports, the Bureau of Manufactures recently received two letters, one from California, the other from Illinois, in which the same method of preventing short payment of postage is suggested. Each firm advises the use in foreign correspondence of envelopes differing in color from those employed for domestic mail. One firm writes:

All stenographers are trained from the time they begin work at our place to use for domestic mail United States light-colored stamped envelopes. All letters addressed to foreign countries must have a blue envelope without a postage stamp on it. Every evening the clerk who has charge of attaching stamps takes the letters in blue envelopes, and after first selecting those that go to foreign countries where 2 cents is sufficient, such as Mexico, Canada, Cuba, Great Britain, and Germany, he affixes 5-cent stamps to all other blue envelopes.

As has been stated in previous articles on this subject, the mere adoption of some system such as that suggested above will not suffice unless constant care is exercised. A system once adopted should be rigidly adhered to, for if those in charge of affixing stamps are allowed to become indifferent or careless complaints are sure to follow.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8919. Railway supplies and port improvements.**—An American minister in a foreign country reports that a local government official would like to receive communications from American manufacturers of railway supplies of all kinds. Considerable railway extensions and port enlargements are contemplated within the next few months. In the meantime the official in charge of these matters would like to hear directly from any firms that would be interested in having specifications and invitations to bid sent to them.
- No. 8920. Electric car lines.**—An American consul in a Latin American country has forwarded a report on a proposed concession for new electric car lines in his district. Copy of the complete report, containing detailed information regarding this contemplated road, will be sent to interested firms by the Bureau of Manufactures.
- No. 8921. Chairs and accessories for shoe-shining establishments.**—A business man in a European country informs an American consulate that he wishes to be placed in communication with American manufacturers of chairs and accessories used at public stands for cleaning and polishing shoes.
- No. 8922. Roll-top desks and sectional bookcases.**—A report from an American consul states that a resident of his district would like to correspond with American manufacturers of roll-top desks and sectional bookcases.
- No. 8923. Floating dock.**—Plans are being prepared by a foreign Government and bids will be invited within a few weeks for a floating dock. The official in charge of this matter would be glad to communicate with interested firms in the United States in regard to this matter. An American minister reports that the idea is to have a dock large enough to accommodate such vessels as visit Black Sea ports, made in three detachable parts, so that only one part need be used in case of small vessels.
- No. 8924. Cheap window shades.**—A merchant in a Mediterranean country informs an American consulate that he desires to be placed in communication with American dealers in cheap window shades. Correspondence may be in English, and prices should be quoted c. i. f. port of destination.
- No. 8925. Railway sleepers and other materials.**—A report has been received from an American consul relative to the importation of crossties and other railway materials into the country in which he is located. Correspondence from a firm that is interested in this proposition and which seems to be in close touch with the railway officials also accompanied the report, as well as specifications covering the material needed and other information that would be valuable to firms interested in the matter. All the foregoing papers, names of firms, etc., will be sent to interested firms in the United States by the Bureau of Manufactures.
- No. 8926. Tobacco and cigarette machinery.**—An American consular officer reports that an organization in a European country requests that American manufacturers of special machines for tobacco manufacturing, especially cigarette machinery and machinery for packing cigarettes and cut smoking tobacco, submit catalogues, price lists, and other particulars.
- No. 8927. Electric transporters.**—The American consul at Montevideo, Uruguay, reports that tenders have been called for furnishing and erecting 24 electric transporters, to be used at the port of Montevideo. Bids will be received until July 13, 1912. Plans and specifications may be seen at the office of the Minister of Public Works; the cost of the plans is \$5.17.
- No. 8928. Water-power driven machinery for making various tools.**—An American consular officer in a European country reports that a steel-tool factory desires to be placed in communication with American manufacturers of machinery, to be driven by water power, for the manufacture of hatchets, shovels, hoes, hammers, etc. It is requested that persons interested write direct in German to the firm referred to.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

- No. 669. Generators and converters.**—Sealed proposals for turbine generators, condensers, synchronous converters (or motor generators), and voltage regulator will be received at the United States Engineer Office, New London, Conn., until June 15, 1912. Information on application to A. E. Waldron, Captain, Engineers.
- No. 670. Navy Department supplies.**—The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., will receive bids until June 18, 1912, for the following supplies. Firms interested therein should make application to the Bureau of Supplies and Accounts, giving the schedule numbers desired: Schedule 4599, gondola cars, duplex steam air compressor, vertical feed-water heater, direct-current electric locomotive, centrifugal machines, hydraulic press for powder. Tenders are invited until June 25, 1912, for the following: Schedule 4613, guncotton press cloth, hydraulic-pressure gauges, steel rails, steel pieces; schedule 4608, American crash, curled hair, upper-deck fire hose, wash-deck hose, red, white, and black cotton thread, linen thread, cotton twine; schedule 4602, convertible steel plate or coast shell fans; schedule 4600, furnishing and installing steam return line; schedule 4614, Klinger gauge glasses, rolled naval brass, rod brass, soft sheet brass, composition pipe fittings, malleable-iron pipe fittings, seamless drawn copper pipe, brass gate valves; schedule 4609, bake-oven grates, ash oars, oak-tanned rigging leather; schedule 4615, tin-plate bunker lamps, cylinder brass oil syringes, brass bolts and nuts, steel bolts and nuts; schedule 4611, sounding navigational machines, illuminated dial peloruses; schedule 4598, paving approaches to new storehouse with vitrified brick; schedule 4617, new pattern safes, safes for use of mail clerks; schedule 4608, green sewing silk; schedule 4612, switch ties, white pine; schedule 4604, steel bolts and nuts, cards, hammers, pickaxes, steel screw clamps, twist drills, hickory handles, snap hooks with rings, calking irons for wood, hydraulic jacks, steel tape measures, bronze drawer pulls, machinists' hand taps, painters' gasoline torches, alligator wrenches, pipe wrenches, screw wrenches; schedule 4601, oak or laurel boat knees, Oregon pine, white pine, white plank spruce; schedule 4607, bronze plates, round bolt copper, medium spelter solder, medium galvanized bar steel, medium bar steel, medium round rivet steel, lead pipe; schedule 4610, pig lead, fire hydraulic, cast-iron pipe, steel pipe, iron gate valves; schedule 4606, medium galvanized steel angles, steel plates; schedule 4603, paint drier, sperm mineral oil, black asphaltum varnish; schedule 4616, lubricating mineral grease, sperm oil; schedule 4605, globe and angle valves.
- No. 671. Fabricated structural steel framing.**—The Mississippi River Commission, 1307 Liggett Building, St. Louis, Mo., will shortly invite bids for the fabricated steel framing for a shop building 70 feet by 160 feet, with truss roof. Specifications and blank form of proposal will be furnished on application.
- No. 672. Subsistence stores and other supplies.**—Sealed proposals will be received at the United States Marine Hospitals, Stapleton, N. Y., and Louisville, Ky., until June 10 and 12, respectively, for furnishing subsistence stores and other supplies required at the hospitals during the fiscal year ending June 30, 1913, in accordance with lists of articles and specifications, copies of which may be had on application to the surgeon in charge of each hospital.
- No. 673. Brush, piles, stone, and spalls.**—Sealed proposals will be received at the United States Engineer Office, customhouse, St. Louis, Mo., until June 15, 1912, for furnishing 50,000 cords of brush, 20,000 piles, 80,000 cubic yards of stone and 20,000 cubic yards of spalls. Information on application to Chas. L. Potter, Lieutenant Colonel, Engineers.
- No. 674. Reinforced concrete floor.**—Sealed proposals will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 29, 1912, for a reinforced concrete floor, balcony, stairs, railings, etc., at the United States Naval Magazine, Fort Lafayette, N. Y. Plans and specifications can be obtained on application to the bureau or to the Inspector of Ordnance, in charge naval magazines, New York district, Iona Island, N. Y.
- No. 675. Medical and hospital supplies.**—Sealed proposals for supplying medical and hospital supplies required by the Medical Department, United States Army, will be received at the Medical Supply Depot, 543 Greenwich Street, New York City, until June 24, 1912. Schedules of supplies, etc., can be obtained at the address referred to.

**DEVELOPMENT WORK IN VENEZUELA.**

[From Consul John A. Ray, Maracaibo.]

For the last few months the region back of Lake Maracaibo, consisting of the States of Tachira, Merida, Trujillo, and Zulia, has been suffering from a plague of grasshoppers. The situation has become so alarming that the government of the State of Zulia has decided to take measures to destroy the grasshoppers. Various methods are being tried in the hope of obtaining relief. The plan from which most is expected is one tried with success in some of the western States of the United States, viz, destroying the grasshoppers with poisoned grain.

As a result of this plague the corn crop of this section is practically a total failure. Corn is quoted on the market of Maracaibo at 48 bolivars a fanega—approximately \$2 a bushel. It seems probable that corn will have to be imported from the United States.

**Sugar Mill Proposed—Electric Light Installations.**

In spite of the distress caused by the loss of the corn crop, plans are under consideration for several enterprises of importance. The most extensive is the proposal to erect a sugar refinery or "central" at Bobures, on Lake Maracaibo, with offices in Maracaibo. The capital stock will be 800,000 bolivars (\$154,000), most of which has already been subscribed locally. The machinery will likely be purchased in the United States.

The towns in the Andes back of Maracaibo are showing considerable activity in installing electric-light plants. At present light plants are being erected in Tovar and Valera, and plans are being formulated for another at Betijoque. Merida, San Cristobal, and Rubio have electric lights, the only important town of the district without such equipment being Trujillo. All these plants are run by water power, and the machinery is of American make and installed by American engineers.

**Street Car Lines, Savings Banks, and Road Making.**

The street railways of Maracaibo seem to be entering upon a new period of development, after having undergone a severe crisis. One line—the Las Delicias line—has ceased operations and the track has been torn up. The Bella Vista line seemed to be about to suffer a similar fate. The creditors of the line have taken over the property, however, and decided to revive it. An order for new equipment has just been sent to the United States. The Bella Vista cars are run by steam power, while the other lines have only mule cars.

Hitherto Maracaibo has had no savings bank. The Sociedad Auxiliar de Artesanos has organized a savings bank for laboring people, modeled after the American dime savings banks. The bank has not yet opened for business, but the success of the project seems assured.

The Venezuelan Government is constructing a macadam road in the State of Tachira. It is thought that this road will aid greatly in the development of that region. The Minister of Public Works is now on a tour of inspection of the road. The machinery used in constructing the road is of English manufacture.

# DAILY CONSULAR AND TRADE REPORTS

## ANNUAL MEETING OF BRITISH CHAMBERS OF COMMERCE.

[From Consul General John L. Griffiths, London.]

At the fifty-second annual meeting of the Association of Chambers of Commerce of the United Kingdom, held in London in March, many questions, bearing not only upon the trade and commerce of the British Empire but of the world at large, were discussed.

Satisfaction was expressed that the British Government "is taking steps to bring about conventions with foreign and colonial Governments in regard to the recognition of commercial arbitration awards," and the hope was signified that "such awards will be made enforceable in all countries entering into these conventions."

### Protection of British Trade-Marks.

The following resolutions were unanimously adopted to protect British trade-marks:

Where instances occur outside the United Kingdom of goods being manufactured or sold or offered or advertised for sale with or under marks or descriptions of such a character as to injuriously affect the rights of a community or trade in the United Kingdom as distinguished from the rights of a private individual, the British Government ought in proper cases, and where legally possible, to take proceedings outside the United Kingdom for the repression of the evil, and further when offenses of a similar character are committed within the United Kingdom, the British Government ought also to take proceedings against the offending parties.

Whereas the interests of British manufacturers are seriously injured by the prevalent practice of marking goods of Continental origin with English names and phrases of a nature to give rise to the false supposition that they are English goods, and whereas the municipal law of France is inadequate to secure for British manufacturers the protection against this practice to which they are entitled under the Madrid convention of 1891; it is resolved that His Majesty's Government be invited to enter into negotiations with the French Government with a view to obtaining such protection for British marks in France; and that His Majesty's Government be requested to make, in any future treaties or arrangements, the protection of foreign marks in the United Kingdom conditional upon a reciprocal protection being extended to British marks, in the country where such foreign marks originate.

### Substitution of Goods.

In the course of the discussion upon the foregoing resolutions, one of the speakers stated:

The question is a much wider one than probably the members realize, there being a huge substitution of goods on the markets of the world that were never made in England. Sheffield is a name peculiarly valuable as a community name, and in

investigations by the people of Sheffield they found many other towns in England also deeply affected. No chamber has been more active in following up the substitution of fraudulent foreign-made goods sold as English goods than the Paris Chamber, and the association owes a great debt of gratitude to that chamber for the work they have done, particularly in pointing out the substitution of needles not made in Redditch, but sold as English goods. In Vienna it is possible to find straw hats marked "London" that never came from Luton, and Belfast knew to its cost how many cotton goods went out with "Shamrocks" on them that were sold as best Irish linen. The evil is exceedingly widespread. For instance, they knew in Sheffield that files which were sold in northern Italy were nearly all of German manufacture. Those files, instead of having centimeters on them, were labeled in inches, and were described as "flat," "bastard," and "half round" in English words. That is an evil which is inflicting a grievous injury upon British commerce. It injures this country in more than one way, because it not only robs it of orders, but goods not intended to be sold under the name of the man who produces them are not usually of very high quality, and the kind of article gotten up for a fraud is generally a discredit to the people who are supposed to father it. Therefore they tend to a diversion of trade by the undermining of the reputation of English goods in the markets of the world.

The conference held last May in Washington did something to remove some of the difficulties. [The result of the proceedings appeared in Daily Consular and Trade Reports for Sept. 2, 1911.] That conference recognized, on behalf of all civilized countries, that the consumers' interests, as well as the producers' interests deserved protection, and the various delegates went back to their countries pledged to recommend to their various Governments that the law as to false marks of origin should be strengthened in those countries where it is deficient. The point has now been reached that the evil is recognized by the representatives of the various Governments, and that legislation is required. It is quite true that possibly not much can be done in many countries until that legislation is put into force, but if the British Government shows an active interest in the question by conducting prosecutions even in a deficient state of law, and uses the fact that defeat followed, as a strong diplomatic argument, as a reason for the various Governments to pass the legislation to which they were pledged at Washington, those prosecutions will be an effective missionary effort in promoting alterations of the law. So strongly does Sheffield feel in regard to the matter that a fund of £11,000 (\$53,531) has been subscribed by the manufacturers for no other purpose than prosecution for fraudulent use of the word "Sheffield" abroad, and in doing so they have given an earnest of their endeavor to stop this particular form of fraud.

#### **The Trans-Atlantic Cable Question.**

A resolution was introduced, but afterwards withdrawn:

That, having regard to the American control of all trans-Atlantic cables touching British territory, this association urges upon His Majesty's Government the necessity, on national and imperial grounds, for cooperation with the Governments of the Dominions—especially Canada—with a view to the establishment of an independent and strictly "all-British" trans-Atlantic cable and land line connecting with the imperial Pacific cable.

In the course of the discussion it was stated by the Parliamentary Secretary to the Postmaster General:

There is no monopoly in the cables as they now stand. There are two groups of cable companies at present, the Western Union group, which works with British companies, and the Commercial Cable group, which works with certain Continental companies. Those two groups have independent land communications carrying on their cable messages; they compete at present actively with one another for business, and there is no reason to suppose that those two groups will ever combine together for control or for raising of rates. But apart from the question of monopoly there is the very important question of control of cables, especially in times of emergency, whether through war or any other cause. At present there are 13 cables crossing the Atlantic, every one of which start on this side from British territory and land on the other side of the Atlantic on British territory. All except one goes direct from British territory on this side to British territory on the other side, the one exception being a cable which touches the Azores on the way. It is perfectly evident that, in case of emergency, the country which controls both ends of the cable controls the cables absolutely, and from that point of view these cables, although operated by private companies, are for practical purposes as completely in the control of this country as if they were actually owned by this country.

**Calendar Reform.**

It was the unanimous opinion of the conference that a fixed date for Easter should be established by international agreement and that the British Government should be requested "to appoint a committee to investigate and report on the three bills now before Parliament on calendar reform."

**Railway Consolidation.**

The recent railway amalgamations and agreements of the United Kingdom were considered, and it was moved and carried:

(1) That while this association is not adverse to the principle of railway amalgamations and agreements which result in the elimination of wasteful competition and unnecessary duplication, provided that proper safeguards and guaranties are inserted for the protection of the interests of the trading community, it views with grave apprehension the increasing restrictions, the withdrawal or limitation of reasonable facilities, and the growing tendency to arbitrary and unfair treatment of the trading community, which, it is alleged, have resulted from the private agreements and understandings already arrived at.

(2) That it is essential to the protection of the interests of the trading community that all amalgamations, agreements, and arrangements between two or more railway companies should be made illegal, unless approved by Parliament; and that no such amalgamations, agreements, or arrangements should be approved unless proper and adequate safeguards are inserted for the protection of the commercial community.

(3) That the president of the Board of Trade be requested to receive a deputation to urge upon him the necessity for immediate action in connection with the matters referred to in this resolution.

**The Freight Problem.**

It was moved and unanimously carried:

That the president of the (British Government) Board of Trade be urged to appoint a strong departmental committee, on which the trading community shall be adequately and effectively represented, with the widest possible terms of reference, to inquire into and report upon the many important questions that have from time to time been raised between railway companies on the one hand and the traders and the general public on the other.

That the president of the Board of Trade be also informed that no proposed solution of the railway question can be regarded as satisfactory which does not confer upon the Board of Trade similar powers with regard to classification, rates, charges, and conditions to those which were conferred upon the board by the railway and canal traffic act of 1888.

In reference to the detention of private owners' wagons (cars) by the railways it was moved and carried:

That the present regulations governing detention of traders' wagons ignore short-distance traffic and deny the trader the right to claim for unreasonable delay, and that this matter ought to be arranged upon a mileage basis, in the same way that railways remunerate themselves for use of their own wagons—for example: On distance up to 20 miles, 1 day; on distance over 20 and not exceeding 100 miles, 2 days; on distance over 100 and not exceeding 200 miles, 3 days; on distance over 200 miles, 4 days, excluding day of departure and arrival.

**British Seamen for British Vessels.**

Attention having been directed to the number of foreign sailors in the British merchant navy, it was moved and unanimously carried:

Considering that there exist no national schools for the efficient technical training of seamen and petty officers for the British mercantile marine, and considering the acknowledged decrease of the number of British seamen and petty officers and the large increase of foreign sailors manning the British mercantile marine, this association is of opinion that the decrease of British and increase of foreign sailors in our merchant navy constitutes a grave national danger, and calls on the Government to take speedy measures for remedying the same.

**Sugar Convention Opposed.**

It was moved and carried:

That this association welcomes the approach of the time when the sugar users of this country will have at their disposal the sugar supplies of the world untrammelled by the terms of the Sugar Convention of 1902, and earnestly requests His Majesty's Government not to entertain any proposals for the renewal of the convention.

That the executive be asked to place this expression of the opinion of the association before the Prime Minister.

The majority in favor of the resolution was so small, however, that the president said that while it had been carried "it could not be put into effect, as the majority was not sufficiently large."

**A Department of Commerce Urged—Marking Merchandise.**

It was the unanimous opinion of the British Chambers of Commerce:

That representations be made to the Prime Minister urging that effect be given to the proposal of the Government (as foreshadowed in the King's speech on the opening of Parliament in 1905) to introduce a bill for the establishment of a Ministry of Commerce, and the desirability of carrying out this necessary and long-delayed reform during the present session of Parliament.

It was moved and carried that a memorial should be addressed to the president of the Board of Trade urging him to recommend the Government to do what it could to secure the enactment of further legislation in reference to the marking of merchandise. It was stated that the purpose of the bill now pending in Parliament was that in future all goods which were manufactured in the British Empire and were imported into the United Kingdom should bear that description, and if they were not manufactured in the British Empire they must be described as "not British."

**Alteration in Fiscal System—Daylight Bill.**

It was unanimously carried that:

Having regard to the conflicting opinions of commercial men in this country on the desirability of an alteration in our fiscal system, it is advisable that the fullest light should be thrown on the subject, and that His Majesty's Government be urged to appoint the strongest possible royal commission to inquire into the whole question and thus lift the consideration of the question above party politics.

Also:

That in the opinion of this association the nominal exemption from income tax at present enjoyed by cooperative societies constitutes a serious injustice to those private traders with whom such societies enter into competition, and that steps be taken to bring them under assessment.

And lastly:

That this association approves of the proposed daylight saving bill, and, believing that the adoption of the principles therein embodied would be of incalculable benefit to the community generally, and especially to those engaged in commerce and industry, desires to express the hope that His Majesty's Government may give early attention to the measure, and that a recommendation to this effect be forwarded to the president of the Board of Trade.

---

**German Mausoleum Work Abroad.**

A Bavarian marble works has just erected in the Greek Catholic Cemetery near Cairo, Egypt, a beautiful mausoleum of red Assuan granite set off with polished blue-colored Bavarian syenite. The success of the German firm in this work had good results, for it soon received another important order—the erection of a mausoleum in Byzantine style in the Jewish graveyard in Cairo. This imposing structure is constructed of light silver-colored Bavarian granite.

**INTERNATIONAL CONFERENCE ON RADIOTELEGRAPHY.**

It is announced that an International Conference on Radiotelegraphy, at which all the countries of the world will be represented, except those having no seaboard, will assemble in London on June 4, and is expected to last for four weeks. There will be about 150 delegates. This is the third international conference that has taken place on the subject of wireless telegraphy, the first being a preliminary and the second a formal conference, held at Berlin in 1906. The third conference was to have been held last year, but was postponed until 1912. On this occasion the British Government will be the hosts and will entertain the delegates at an inaugural banquet. The object of the conference is to make regulations for wireless telegraphy as carried on by means of ship to shore messages, and its discussions will have no reference to long-distance wireless services nor to the scheme of British imperial wireless stations which is now being carried out. The existing regulations will be brought up to date in view of the great developments which have taken place since the last conference. The sittings of the conference will be held at the Institute of Electrical Engineers. The details of the program are not yet complete, as the various countries to be represented are submitting resolutions which have still to be embodied in the general program. The main object of this and the preceding conferences is to secure uniformity of working among all vessels licensed for wireless installations and the shore stations.

**American Delegates to Conference.**

A list of American delegates who will attend the London Radiotelegraphic Conference follows:

*Navy Department.*—Rear Admiral John R. Edwards, U. S. Navy, general inspector of machinery and naval vessels built on the Atlantic coast, chairman of the delegation; Lieut. Commander David W. Todd, U. S. Navy; Louis W. Austin, Ph. D., in charge radio experimentation, Navy Department.

*War Department.*—Maj. George G. Squier, Signal Corps, U. S. Army; Maj. Edgar Russell, Signal Corps, U. S. Army; Maj. Charles McK. Saltsman, Signal Corps, U. S. Army.

*Department of Commerce and Labor.*—Mr. John I. Waterbury, of New Jersey (who represented the Department of Commerce and Labor at the preliminary conference at Berlin in 1903; at the Berlin Conference of 1906, and secured the adoption of the supplementary agreement requiring interchange of wireless messages "without distinction of the wireless telegraph system" adopted by wireless stations on shipboard); Prof. Arthur Gordon Webster, professor of physics, Clark University, Worcester, Mass.; Mr. John Hays Hammond, jr., New York City; Mr. William D. Terrell, United States wireless ship inspector, Department of Commerce and Labor, New York, N. Y.

*Department of Agriculture.*—Prof. Willis L. Moore, Chief, United States Weather Bureau.

*Treasury Department.*—Constructor John Q. Walton, United States Revenue-Cutter Service.

---

*The Russian coal mines* and their main offices have been listed by Consul General John H. Snodgrass, of Moscow. The list will be loaned on application to the Bureau of Manufactures at Washington.

**COMMERCIAL REVIEW OF BIRMINGHAM.**

[By Consul Albert Halstead.]

The industrial activity of Birmingham during 1911 was the greatest experienced in a number of years. Although manufacturers in this English district are somewhat hampered by difficulties of access to the sea and comparatively high freight rates, there is no evidence of any falling off in their enterprise or activity, but instead a continued improvement of the methods of manufacture.

It is impossible to give any official statistics of the imports of American products into the Birmingham district, as this city is not a seaport; but, judging from the American goods seen in the shops and elsewhere here, and the increasing number of inquiries from potential British purchasers, there is apparently a gradual growth in the purchases from the United States. This trade growth seems also to be indicated by the inquiries from American manufacturers, which have probably doubled in the past five years, and which are more frequently followed by further letters showing that successful business has resulted from the investigations made.

**Increasing Utilization of the Consular Service.**

American manufacturers are showing a greater recognition of the real value and helpfulness of the consular service and of the genuine desire of American consuls to assist them in the introduction of their products. While a consul can not be informed of every opportunity in his district, he can usually give advice that is of material assistance. American trade methods also appear to be improving, and there is a better understanding of not only the differences between American customs and those of foreign countries but of the methods of obtaining foreign business. While the sale of goods f. o. b. American ports or c. i. f. British ports is still adhered to by the average American manufacturer, in a number of recent instances firms communicating with this consulate have shown a desire to make their terms and conditions correspond as nearly as possible to those prevailing in the United Kingdom.

Another feature, showing a different view of the duties of consular officers, is the growing tendency of American merchants to ask consuls for the names of manufacturers of products that they think will sell in the United States. British consular officers are not permitted to furnish the names of foreign manufacturers, and the supplying of such information, with the view to aiding imports from abroad, is not one of the duties of consular officers of the United States.

**Effects of British Patents Act.**

The British patents and designs act has been in operation for about four years, but it is impossible to give complete facts or many definite instances of its effect upon American manufacturers. This act requires foreign owners of inventions patented under the British law to manufacture or license the manufacture of their product within the United Kingdom within two years of the date of patent, on penalty of forfeiture. As a result of this act, a large American firm manufacturing a machine for which it has master patents is preparing for the organization of a company in the United Kingdom, to operate in the Birmingham district.

The effect of this act is also apparent from an inquiry recently received from an American who desired to dispose of the British patent rights to a certain tool. Had the owner of this patent not been apprehensive of losing his patent rights in England, he would have exported the product from the United States. As it is, the necessity of selling within a certain time will probably hamper him in obtaining a satisfactory price for his patent. In some instances, American owners of patents have licensed the manufacture of their products in this district.

A British firm with no American capital is now manufacturing in the United Kingdom a typical American product which had been introduced most successfully into England. This article was covered by a number of patents, the most important of which, it is understood, were abrogated because of failure to comply with the provisions of the patents act of 1907. The trade name of the American product is well known, however, and the American company is meeting the competition by advertising and excellent sales methods. Complaints have been made in the case of one article which is now being made in the United Kingdom, that the British product is not equal to the American.

#### **Opportunities for American Goods—Fuel Economy.**

There appear to be no strikingly new openings for the sale of American manufactures here. The coal strike in the early part of 1912 drew renewed attention to the use of fuel other than coal for supplying power for manufacturing. Many gas-engine users who have depended on the gas-supply authorities for their gas are disposed to adopt oil engines, while attention is being devoted to economy in the use of fuel, to the improvement of engines using crude or unrefined oil, and to other kinds of fuel or power that will make manufacturers less dependent upon coal. There might develop openings for American devices that will permit the use of substitutes for coal or greater economy in coal consumption. Alcohol can not be economically used here on account of the excise laws.

The preference of the British purchaser for articles of domestic origin, which has frequently been noted in the past, shows no abatement, but there is a steady market for many products made in the United States, provided the field is assiduously cultivated, supplies are always available, and British customs and prejudices, which include quick deliveries, are fully considered. The American manufacturer has an important field in Birmingham, because of the immense amount of manufacturing here, requiring machinery, raw materials, and semiraw materials in great quantities. This field is difficult, however, because practically everything that can be offered for sale from the United States is manufactured within the district.

#### **Automobile Industry.**

Probably half of the motor cars manufactured in the United Kingdom are made within a radius of 25 miles from Birmingham. This industry profited splendidly in 1911, and the demand necessitated the increasing of most of the larger factories. British cars showed an improvement in design and an average reduction in price.

Some British manufacturers have attempted to put on the market equally good cars at prices approaching those of the American makes,

but without equal success. There is now some talk of a combination of British manufacturers to make possible the production of good cars in larger quantities at prices similar to those of the American cars. British manufacturers and capital, when they see a public demand discovered by foreign competitors, generally manage to meet that competition with considerable success. Frequently the foreigner has done the missionary work and reaped the first harvest, and then found his goods partly supplanted by British products of a similar type. Automatic machinery, machine tools, typewriters, and cash registers, however, are striking exceptions to this rather general rule.

American automobiles of the highest grade, equal to the best British or other makes, have not, with perhaps two exceptions, been introduced into the British market, as the American demand consumes all the product of the American factories turning out this grade of cars, while British purchasers prefer the British or Continental make.

There is as yet no British demand for electric automobiles. A few of this class are obtainable in London, but they are not up-to-date, compared with the American types. There is probably but one British firm now making electric automobiles. Several firms turn out gasoline-electric vehicles, which are employed to a small extent on railways and promise to come into wider use. There is not and never has been any large demand for electric automobiles in England, as the gasoline car is preferred, and seems to meet all requirements.

Private companies and municipal authorities selling electricity have given little attention to increasing the demand for current by making low rates for charging batteries, establishing charging stations, and going after this potential business in a serious way. Before electric vehicles can be successfully introduced electricity for charging purposes must be made generally available. Because of their design and efficiency American electric automobiles may ultimately succeed in the United Kingdom, but British makers are then certain to produce similar types, with slight changes intended to make them more suitable for the British market.

#### **Commercial Automobiles—Motor Cycles and Bicycles.**

British makers of commercial motors last year had more than they could do to keep pace with the demand, and many new companies engaged in this line of manufacture. One of the principal passenger motor car makers in Birmingham is about to build commercial cars as well. American commercial motors have made little headway in the United Kingdom, though one company that uses its passenger chassis with a special body is steadily increasing its sales for light delivery purposes, while another light delivery wagon, such as is used by the department stores in the United States, is offered for sale. None of the latter are to be seen in Birmingham. British manufacturers of commercial vehicles and British technical papers assert that the heavy British commercial motor is superior to any made in the United States.

The increase of \$81,233 in the exports of motor cars and parts from Birmingham to the United States represented almost entirely shipments of sleeveless-valve engines and parts invented by an American

and adopted by one of the large automobile works in Coventry. The engines shipped are apparently used by several American manufacturers, and such shipments are not unlikely to decrease as their manufacture in the United States increases.

A majority of the motor cycles made in the United Kingdom are produced in the Birmingham district, and the industry developed remarkably during 1911. Many bicycle makers added the making of motor cycles as a branch, and the branch often became the most important part of the business. This industry is not hampered by competition, as the motor cycles made in the United Kingdom are superior to those made on the Continent. Only one American firm has had any success in selling motor cycles in this country, and it is doubtful, considering the character and excellence of the British motor cycles and the great productive capacity of the British firms now engaged in the trade, if other American firms could do as well here. The firm mentioned did a good business last year and captured some important racing prizes against serious British competition.

The local manufacture of bicycles continues to be important, and the makers in the domestic field had one of their best years in 1911.

#### **Metallic Bedsteads—Leather and Gloves.**

The manufacturers of metallic bedsteads 10 or 15 years ago were able to export their products in large quantities to the United States, but that market has been almost entirely lost through the development of bedstead manufacture at home, although bedstead parts are still exported in comparatively small quantities. The most striking feature of this trade in 1911 was the formation of a combination for the regulation of prices, which is believed to have ended that bitter competition which was proving so disastrous to the industry. A combination was formed some years ago, but this did not hold together, because it was impossible to penalize bedstead makers who broke the regulations. With deposits made by various members of the combination as earnest of good faith, it will become increasingly unprofitable for any manufacturer to violate the present agreement.

Despite high prices for raw and dressed leather business in the leather trade during 1911 was the largest for a number of years. There was a striking revival in the harness and saddlery industry from the decline which followed the introduction of the automobile. The fancy leather trades grew satisfactorily during the year. The demand for leather goods for the motor trade was a prominent feature. Dealers showed a tendency to buy their fancy leathers for automobiles from manufacturers in Walsall and Birmingham instead of in Vienna and other continental markets. South Africa was the largest market for harness and saddlery, with South America next.

If the Birmingham consular district were to be credited with all the gloves manufactured here and shipped to the United States, the total would be over \$1,000,000, as most of the English gloves of well-known makes sold in the United States are made near Birmingham, but sorted, packed, and declared in London.

#### **Carpet and other Trades—Coal and Iron.**

The carpet and upholstery trade, which centers at Kidderminster, experienced an excellent home and export demand during 1911.

Except for the usual complaint of the high price of raw material, the manufacturers had every cause for satisfaction. They complained that there was considerable dumping of American products in the markets which they sought, which simply meant that the competition of the American manufacturers was felt. There was little unemployment at Kidderminster.

The demand for British hardware in Germany, France, and other Continental markets is less than formerly. The best markets for this trade were found in India, Australia, and South Africa, followed by Brazil, New Zealand, and Canada. The shipments to Argentina, Germany, France, Chile, and the Netherlands showed decreases. The shipments of hardware from Birmingham to the United States showed a considerable increase.

The 1911 demand for the best grade of guns was the best of any year in the present century, largely on account of the fine summer and better trade conditions. Although often sold under London names, high-grade guns are made almost exclusively at Birmingham. The manufacture of military supplies is also an important industry here.

The coal-mining industry in the Midlands, South Staffordshire, Warwickshire, and Worcestershire experienced greater extremes and fluctuations than in either of the two preceding years, the trade of the opening months showing an improvement in volume and being rather promising, with spring bringing a reaction and extraordinary stagnation. Autumn and winter saw a complete rebound, which increased the demand until it was in excess of 1910 and 1909. Toward the end of the year industrial activity and the fear of a coal strike increased the desire to secure coal to provide against emergencies, which enabled quotations to be put on a more satisfactory basis, and caused mines to be exceptionally busy.

The Iron and Coal Trades Review calls the year the most trying in the history of the South Staffordshire iron industry. Strong foreign competition, weak quotations, falling prices, and stagnation of demand came early in the year when there had been hopes of activity; but the iron and steel industry became sufficiently prosperous during the latter part of the year to make it the best since 1907, the improvement beginning about the middle of July, when foreign competition became easier. The transport strike in August disorganized business, but the year ended with general activity and prices substantially advanced, with most manufacturers sold well into the first quarter of 1912.

#### **Needles and Fishing Tackle—Jewelry and Silver.**

Business in the needle and fishing-tackle industry in Redditch was greater than in any other recent year and prices were well maintained. German competition has become important to the English needle makers and its general effect has been to cause improvements in methods of production through the more extensive use of machinery. As a result, some small firms were absorbed by larger ones and several of the large ones were amalgamated, so Redditch has maintained its hold on the most important markets of the world. The Redditch needle that sells best is almost without exception of the higher and medium quality. Though cheaper needles are made,

they are hit rather keenly by the German makers. Business was good almost uninterruptedly throughout 1911. Australia and Continental markets took their usual quantity, while Canada and South Africa showed an increased demand. In fishing tackle there was a recovery after several unfavorable seasons, and the business was active through the year. The growth of the fishing-tackle industry during the year was said to be largely due to the increased demand from Russia and Canada.

In the manufacture of jewelry and silverware 1911 gave no particularly good results. Manufacturing jewelers had a normal business, but as there had been expectations of a particularly fine year, disappointment followed. The jewelers benefited to a certain degree from improved general conditions, but not in any sense in proportion to the increase of British prosperity. Silversmiths had a better year than the jewelers and in the cheaper grades business was considerably above the average. The manufacture of electroplate in Birmingham has increased for some years and grew considerably in 1911. Much attention has been paid by jewelers and silversmiths to colonial and foreign markets, with good results.

#### **Glass Trade—Engineering and Machinery.**

In the manufacture of the various kinds of glass which are specialties of Birmingham and vicinity, the year was one of the most active and profitable experienced in some time. Purchases were made steadily, the home trade was good, and foreign and colonial demand was much increased, while in plate glass the shipments were a little below the previous year. In flint glass bottles and other sorts of manufacture there were considerable increases in the exports, and home demands showed decided improvement.

In the engineering industry in the Birmingham district, prices were more remunerative and the volume of work was greater than in 1910. The expansion of manufacturing exceeded the increase in works capacity in a number of lines, so engine builders, machinists, and tool makers had additional work. Manufacturers of American machinery enjoyed their share of this additional demand. Wages were advanced in the engineering trades during the year by 1s. (24 cents) per week on time rates and 2½ per cent on piece work. Exports were greater than in the previous year.

#### **Artificial Silk—Exports to the United States.**

The largest item of export from the Birmingham consular district to the United States in 1911 was wood-pulp yarn, or artificial silk. This industry was established in Coventry only a few years ago, and its owners have since organized a company and constructed a factory in the United States. The increased exports to the United States, in spite of the production of the yarn there, indicate the extent of the increase in the use of artificial silk. With cotton or wool added to give it strength, this material is said to make as beautiful a textile as all silk, and is perhaps more durable. Artificial silk is being used for making silk bindings, silk braids, silk embroidery, and silk lace for ladies' costumes.

The value of the principal exports from this district to the United States, as invoiced at the Birmingham consulate and the agencies at

Redditch and Kidderminster, is shown in the following table, for 1910 and 1911:

The exports from Birmingham to the American insular possessions during 1910 and 1911, respectively, were as follows: Philippine Islands, \$87,000 and \$76,264; Porto Rico, \$44,121 and \$31,118; Hawaii, \$1,787 and \$1,535.

The principal exports to the Philippine Islands in 1911 were: Hardware, \$11,848; metal sheathing, \$9,299; saddlery, \$10,528; iron and steel manufactures, \$6,729; and chocolate confectionery, \$6,202. To Porto Rico the principal exports were: Hardware, \$7,094; hoes, \$9,792; matches, \$7,354; and paint, \$3,205. The exports to Hawaii were made up of scientific instruments, valued at \$592, and screws, etc., at \$943.

### PARCEL POST TO ECUADOR.

[From Vice Consul General Robert B. Jones, Guayaquil.]

Shipping by express to Ecuador is very expensive. It would always be better to ship small packages by parcel post. Coming by express, a full set of customhouse documents must be made out, and lighterage, wharfage, storage for one month in the customhouse, handling on wharf and in the customhouse must all be paid for, besides the commission for dispatching same, all of which is avoided when sent by mail. Spanish is the language used here, but most houses have correspondents who understand English.

**NOTES FROM TAIWAN.**

[From Consul Samuel C. Reat, Tamsui.]

**Total Sugar Production.**

The total sugar production in Formosa (or Taiwan) for the 1911-12 season is 300,676 tons. The amount of sugar manufactured by the modern centrifugal process was 216,019 tons, while improved and native mills produced 84,657 tons. Practically all the sugar will go to Japan. At the beginning of the season a small shipment was made to Canada. Next season it is possible that white sugar will be made by the Formosan factories, providing some agreement be reached between the sugar manufacturers and refiners in Japan. With the proposed erection of two new factories—one by the Minami Nippon Seito Kaisha (South Japan Sugar Co.), the other by the Teikoku Seito Kaisha (Imperial Sugar Co.)—the total number of modern-system factories in Taiwan will be 34.

**The Mining Industry of Formosa.**

The mining industry of Formosa for 1911 was as follows: Number of mines—gold, 9; gold-copper, 1; gold dust, 27; copper, 2; mercury, 1; coal, 270; petroleum, 39; sulphur, 16. Production—Gold, \$1,065,400; gold dust, \$48,882; silver, \$32,525; copper, \$264,513; coal, \$468,317; petroleum, \$3,243; sulphur, \$22,950.

**Tea and Camphor Production—Ice Making.**

The tea season opened May 1, and while it is early to make predictions, yet many are hazarded. The prevailing sentiment is that the production will be larger and prices higher. At any rate, the small amount now offered (Apr. 23) is a slight advance over the same grade at this time last year. Exporters will be increased this year by the addition of a Chicago concern, making six American firms represented.

The production of the Camphor Monopoly for last fiscal year, 1911-12, amounted as follows: Camphor, 6,264,416 pounds; camphor oil, 7,272,580 pounds. This is a slight increase.

With \$100,000 capital, the Taihoku Ice Manufacturing Co. is being established in Taihoku. Promoters are T. Matsumura, S. Sawai, and others. The ice works will be located in Daitotei, Taihoku, Formosa.

**SHEEP INDUSTRY IN NEWFOUNDLAND.**

[From Vice Consul Henry F. Bradshaw St. Johns, Apr. 17.]

While there are but 130,000 sheep in Newfoundland at present, a material increase in that number is expected the coming season. There are no large stock farms or ranches in the colony, the sheep being scattered over the island in small flocks owned chiefly by fishermen-farmers. The St. Johns Agricultural Society plans to go into the business of raising sheep and is making arrangements to import about 500 animals during the next three months. The St. Johns Golf Link Club has about 100 sheep on its grounds to keep the links in good condition. A woolen industry has recently been established at St. Johns.

[An article relating to the efforts of the Canadian Government to interest the eastern Provinces in sheep raising, and one giving the results of an experiment carried out on a small group of neighboring islands appeared in Daily Consular and Trade Reports dated, respectively, Mar. 16 and Apr. 18, 1911.]

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8929. Ventilating fans and parts.**—An American consular officer in the United Kingdom reports that a business firm in his district has inquired for the names of American makers of ventilating fans driven by hot-air motors, to be fitted with Bunsen burners suitable for petrol air gas. The following dimensions have been suggested, but may be varied, however, within reasonable limits: Diameter, 12 to 24 inches; height, 20 to 40 inches; number of revolutions, from 600 for small to approximately 300 for large sizes; the net cost prices delivered in the country not to exceed about \$10 for small fans. The firm also states in its communication that it would like to receive prices for parts to be used for repairs.
- No. 8930. Asbestos products.**—A Japanese firm, with a number of branch offices, informs an American consular officer that it desires to be put in touch with American manufacturers of asbestos products. This firm has done considerable export business in the Orient in this line with Canadian products, but these have not proved entirely satisfactory either in quality or price, and it now desires to communicate with manufacturers in the United States, preferably those in a position to ship their orders via Suez from the Atlantic seaboard. Bank references are furnished.
- No. 8931. Agencies for American firms.**—A report from an American consul states that a firm of commission agents in his district would like to secure agencies for any business houses in the United States caring to do an export business with the country in question.
- No. 8932. Shelf covers, table braises, and stair and floor cloths.**—The Bureau of Manufactures is in receipt of a communication from a manufacturing firm in the United States stating that it has an inquiry from a customer in a European country for the names of manufacturers of shelf covers, table braises, and stair and floor cloths. American firms in a position to supply these articles should communicate with the firm in question as soon as possible.
- No. 8933. Glass preserve jars.**—An American consular officer in Canada reports that a resident of his district, who furnishes bank references, desires to receive quotations from manufacturers of 3-pound glass jars, known as "honey jars," and 10-ounce jars of a similar sort.
- No. 8934. Machines for grating coconuts.**—A report from an American consulate in a Latin-American country states that a local exporter to the United States desires to obtain catalogues of machines for grating coconuts. Manufacturers of such machines should forward catalogues in the Spanish language, if possible.
- No. 8935. Duplicating machines.**—A business firm in South Africa, dealing in typewriters and supplies, informs an American consulate that it is anxious to get in touch with American manufacturers of a good duplicating machine suitable for that market. The firm states that it could do considerable business with such a machine. Correspondence with the firm in question should be in English.
- No. 8936. Flour.**—A report from an American consulate in the United Kingdom regarding the market for flour in his district was accompanied by a letter from a local firm requesting to be put in touch with certain American shippers of this article. This firm has for 35 years been the representative of some of the leading American milling concerns. It desires to have connections, however, with one of the best shippers in each of the principal flour exporting States, and the only State not represented, and for which there are many openings in that market, is Nebraska. Correspondence is desired with any miller desiring to do an export business. Business terms give the shippers absolute security, as the drafts against which shipments are made have to be paid before delivery of the goods can be obtained. As this firm already has the agency for many milling firms in the United States correspondence is desired with shippers in the State of Nebraska only.

- No. 8937. Iron and steel products.**—An American consul reports that the manager of certain foreign metal-working factories desires to enter into correspondence with American manufacturers of iron and steel products with a view to purchasing medium quality boiler sheets, angle and bar iron, etc. The present demands amount to 500 to 800 tons per annum, and up to the present purchases have been made from Germany and Belgium. It is preferable that correspondence should be in Russian.
- No. 8938. Sewing machines, motors, boats, automobiles, etc.**—A business firm in a Mediterranean country informs an American consulate that it is in the market for the following articles: Sewing machines, marine motors, motor boats, steel and wood, knocked down; electric automobiles, small coupé type, two seats; and motor cycles. The firm is well rated and has large showrooms on the principal thoroughfare of the city in which it is located. American firms not represented in that region will be given preference, as the firm does not care to do business with middlemen.
- No. 8939. Aluminum ware.**—Some of the large wholesale merchants in an Asiatic city have requested an American consul to secure the names of American manufacturers of aluminum ware. They are willing to accept an agency in this line. Aluminum ware companies should send illustrated catalogues and prices c. i. f. point of destination to the merchants referred to, also to the consulate submitting the inquiry. Prices should be given in English currency.
- No. 8940. Automobiles.**—A report from an American consular officer in a Latin-American country states that a resident of his district desires catalogues and prices for the purchase of two 16-passenger automobile trucks, to be delivered in November. These trucks are to be used for passenger service that is to be established between two cities upon the completion of a boulevard now under construction. Another resident of his district desires catalogues and prices for a five-passenger touring car, to be delivered at once. Price of this car should not exceed \$1,500.
- No. 8941. Lubricating oils and greases.**—An American consul in a European country reports that a business man in his district has requested to be placed in communication with first-class American manufacturers of lubricating oils and greases. The inquirer does not desire to act as agent, but wishes to make direct purchases against cash. Preference will be given to firms which are not represented in the country in which he is located, as he does not care to do business through middlemen. Samples and quotations c. i. f. city of destination should be furnished as early as convenient to the person in question.
- No. 8942. Sugar exchange.**—A sugar association in a foreign country is considering a proposition for the erection of a central sugar exchange, and with this object in view a committee of the association desires information regarding the best means of storing and stacking white sugars, character of building which should be erected, best means of conveying sugar by machinery from railway tracks to building, best means of stacking sugar by machinery, and any other points on which the committee should be informed.
- No. 8943. Paper.**—A business man in a South American country informs an American consular officer that he would like to receive quotations c. i. f. city in which he is located for paper similar to samples which can be obtained from the Bureau of Manufactures, or of even better quality paper. This stationery is intended for the use of the Department of Justice in the country in question. Correspondence should be in Spanish.
- No. 8944. Automobiles.**—A member of a trade organization in the United States, who resides in a large city of the West Indies, desires to purchase several passenger auto busses, each capable of carrying 14 or more persons, to replace coaches in a passenger service between two cities. Specifications and conditions of service can be obtained by addressing the organization in question.
- No. 8945. Plant for manufacture of turpentine.**—A business man in Central America informs an American association that he desires to install a complete plant for the manufacture of turpentine by the direct distillation of wood. Further particulars regarding this plant can be secured by communicating with the association referred to.

**CALCUTTA-PACIFIC COAST FREIGHT CONFERENCE.**

[From Consul General George E. Anderson, Hongkong, China.]

The trans-Pacific freight trade, particularly that portion concerned in exports from Calcutta to the United States, is agitated by the severance of the connection with the Calcutta-Pacific Coast Freight Conference of the Nippon Yusen Kaisha, the subsidized Japanese company which maintains a trans-Pacific service from Hongkong to Puget Sound ports and has maintained a service between Calcutta and Kobe via Hongkong. The severance is by formal action of the Conference lines. The action grows out of the establishment of this Japanese Calcutta-Kobe service which sought chiefly to reach the trade in gunny bags for the United States. Upon the Calcutta-Hongkong Conference lines refusing to admit the Japanese line as a member, the latter announced that unless the Conference would admit its Calcutta service the company would withdraw from the gunny agreement of the Calcutta-trans-Pacific service. It appears, however, that previous to this announcement the company signed forward contracts for gunny business to the United States for the season commencing July 1, 1912, contracts made before the Conference had agreed upon rates for such season; and for this course the Conference took the action noted.

The result is expected to be a long and hard freight rate war on trans-Pacific freights and particularly upon goods from India for the United States by way of the Pacific. The chief commodity affected is gunny sacks, but the trade also includes large quantities of jute, hessian cloth, tea, kapok, iron, bone meal, pepper and condiments, coir hawsers and yarn, indigo, linseed and linseed oil, hemp, ocher, rape cake, myrobolans, tumeric, and various other products. The freight on tea at present (Apr. 20) from Calcutta to the Pacific coast is \$12 per ton; that on all other commodities except prison jute \$8 gold per ton; and on prison jute \$6 per ton—all cubic-foot tons and all subject to a deferred rebate of \$2 per ton. Apparently Conference rates on other goods have not yet been fixed.

---

**BRITISH CAPITALISTS TOUR CANADA.**

[From the Monetary Times, Toronto.]

A committee, composed of members of the Halifax, Nova Scotia, city council and board of trade, recently met and mapped out a program of entertainment for the visiting British capitalists who will arrive there on June 10.

This large party of British men of affairs constitute the "Financial News" industrial and financial commission, and represent \$1,250,000,000 British capital. These ambassadors of British industry, bent on a mission fraught with great imperial possibilities, include leading men in almost every branch of British manufacture. Armor plating and ordnance making, electrical engineering, and almost all other branches of engineering, the motor-car industry, printing, flour milling, biscuit making, and general confectionery, all kinds of food preparations, with many another typical British industry, are represented by this delegation. British chambers of commerce and insurance offices are likewise to the fore. These captains of industry who, on a tour extending over two months, are giving their time with the serious purpose in view of seeing how far each can contribute to the building up of Canadian industry.

# DAILY CONSULAR AND TRADE REPORTS

ISSUED BY THE BUREAU OF MANUFACTURES, DEPARTMENT OF COMMERCE AND LABOR

15th Year

Washington, Friday, June 7, 1912

## INCREASED CANADIAN COMMERCE.

[By Consul General John G. Foster, Ottawa.]

There was an increase of \$85,958,981 in the value of the foreign trade of Canada for last year compared with 1910. The figures for 1911 were \$828,614,120 compared with \$742,655,139 for 1910, \$642,943,657 for 1909, and \$562,293,281 for 1908. Of the total foreign trade last year, 55 per cent was with the United States against 52 per cent in 1910 and 49 per cent in 1909.

The imports into the country increased in value about 18 per cent over 1910. Those from the United States increased 26 per cent, from the United Kingdom 5.2 per cent, from Germany 27.35 per cent, and from France 3.39 per cent. There was an increase of only a little over 1 per cent in the exports from Canada, and those to the United States decreased 1.65 per cent, and to France 17 per cent. Those to the United Kingdom increased 4.9 per cent, and to Germany 24.8 per cent.

The amount of duty collected during the fiscal year ended March 31, 1911, was \$72,935,639. The average duty on dutiable imports from the United States was 24.737 per cent, and on those from the United Kingdom 24.561 per cent.

### Trade by Countries.

The following table shows the value of the imports into and exports out of Canada, by countries, for 1910 and 1911:

Countries.	Value of imports.		Value of exports.	
	1910	1911	1910	1911
United Kingdom.....	\$107,679,719	\$113,299,424	\$140,495,937	\$147,418,321
Other British.....	19,824,785	19,220,146	17,531,106	17,459,467
United States.....	270,644,736	341,192,612	117,145,555	115,203,454
France.....	11,376,879	11,763,291	2,728,627	2,257,799
Germany.....	8,782,174	11,184,790	2,717,301	3,393,213
Other countries.....	25,490,565	28,190,529	18,231,745	18,031,084
Total.....	443,804,868	524,850,792	298,850,371	303,763,328

### Purchases from the United States and Other Countries.

Of the total imports from the United States last year, merchandise valued at \$186,836,477 was subject to duty and \$154,356,135 worth

admitted free, against \$143,777,541 and \$126,867,195, respectively, for 1910. Of the imports from the United Kingdom, \$86,575,640 worth of merchandise was dutiable and \$26,723,784 worth was admitted free, compared with \$82,451,681 and \$25,228,038, respectively, for 1910. The following table shows the principal imports and their value from the United States, the United Kingdom, and other countries during 1910 and 1911:

Articles.	From United States.		From United Kingdom.		From other countries.	
	1910	1911	1910	1911	1910	1911

#### American Automobiles, Cotton, Clothing, Fruits, Shoes, etc.

The value of the automobiles imported from the United States last year was \$5,416,776, or a gain of 60 per cent over the previous year. The automobiles imported from the United Kingdom were valued at \$328,984, a gain of 30 per cent. The United States supplied prac-

tically all the corsets imported, which amounted to \$442,318 worth. The raw cotton imported from the United States last year amounted to 74,978,410 pounds, valued at \$9,810,955. There was an increase of 30 per cent in the receipts of clothing from the United States compared with 1910, the total last year amounting to \$1,091,341 worth. The imports of clothing from the United Kingdom were valued at \$1,677,322, or a gain of only 8 per cent. Of the total imports of dried fruits and nuts, the United States furnished about one-half, or about \$2,680,000 worth. In green fruit the American product was practically the only one imported, of which \$2,241,201 worth was dutiable and \$5,723,915 worth free. Gunpowder and explosives were imported from the United States to the value of \$391,562, and from the United Kingdom to the value of \$1,032,291. American boots and shoes imported were valued at \$2,257,792, an increase of \$696,462 over 1910. Dutiable musical instruments were imported from the United States to the value of \$1,125,648, from the United Kingdom \$69,979, and from other countries \$1,125,648. American agricultural implements also showed an increased importation, the total receipts for last year being valued at \$4,443,620. Engines other than locomotives, including boilers, were imported from the United States to the value of \$2,502,489. Of the total imports of iron and steel and their manufactures, amounting in value to \$98,165,443 for last year, the United States furnished \$81,014,029 worth, of which \$73,342,868 worth was subject to duty. Of the mineral oil valued at \$5,236,835 imported from the United States last year, \$4,203,323 worth was admitted free.

#### Exports of Canadian Produce.

Of the total Canadian exports last year, valued at \$303,763,328, \$279,446,816 represented home produce and the remainder foreign produce. The following table shows the value of the shipments of home produce to the United States, United Kingdom, and other countries during 1910 and 1911:

Agricultural products represent the principal Canadian exports, the shipments last year being valued at \$98,527,518, followed by animal products with \$50,045,005, mineral products \$41,121,688, forest products \$39,403,098, and the fishery products \$15,816,992.

**Exports of Wheat and Flour, Fish, Apples, Agricultural Implements, etc.**

The exports last year of Canadian wheat and wheat flour amounted in value to \$74,242,815, of which only \$364,995 worth was shipped to the United States. All the fresh lobster exports, which amounted to \$592,994, were sent to the United States. Canned lobsters were exported to the United Kingdom to the value of \$1,105,720, to the United States \$911,197, and to other countries \$1,092,158. The shipments of canned salmon were slightly less than for 1910, the exports to the United Kingdom being valued at \$2,670,000, to the United States \$13,692, and to other countries \$718,494. The shipments of green apples to the United Kingdom last year were valued at \$3,913,871, a gain of \$1,576,723 over the previous year.

Canada exported agricultural implements valued at over \$6,000,000, an increase of over \$1,000,000 compared with 1910. Only about \$500,000 worth was sold to the United States and the United Kingdom, the largest purchasers being Russia in Europe and Australia, the latter country taking \$1,239,714 worth. For the fiscal year ended March 31, 1911, Russia purchased harvesters from Canada valued at nearly \$1,000,000, and consisting of reapers, mowing machines, and other implements. The shipments of iron and steel and their manufactures amounted to nearly \$9,000,000, an increase of \$750,000 over 1910.

**The Dairy Industry—Field Crops—Live Stock.**

There has been a steady decrease in the shipments of Canadian butter during the past 10 years. The exports in 1901 were valued at \$3,295,663, while during 1911 they were only \$2,080,688, in spite of the fact that during the period the price of butter has increased 31 per cent. The exports of cheese during last year were valued at \$21,443,031. The latest official statistics available showing the output of Canadian factory butter are for 1910, which give the total output at 59,875,097 pounds, valued at \$15,682,564, and factory cheese 231,012,798 pounds, valued at \$21,620,654. There were, in 1910, 3,616 factories in Canada engaged in the manufacture of butter and cheese. There were 12 condensed milk factories in operation and the output was valued at \$1,839,871.

The field crops of the Dominion for last year occupied an area of 32,853,074 acres; and the value of the output, according to the average local market prices, was \$565,711,600. [Statistics on the field crops for 1911 were published in the Daily Consular and Trade Reports for Jan. 26, 1912.]

The number of live stock on the Canadian farms at the end of 1911 was as follows: Horses, 2,266,400; milch cows, 2,876,600; other cattle, 4,210,000; sheep, 2,389,300; and swine, 2,792,200.

**Output of Minerals, and Forest Products.**

There was a decrease of \$3,241,445 in the output of the metallic minerals of the Dominion compared with 1910 and \$1,290,492 in the nonmetallic minerals, the total production for 1911 being valued at \$46,197,428 and \$56,094,258, respectively. Coal was the principal product, the output being 11,291,553 tons, valued at \$26,378,477, followed by silver, nickel, gold, clay products, and copper. [Statistics

showing the output of minerals in Canada for 1911 were published in the Daily Consular and Trade Reports for Mar. 26, 1912.]

The latest official statistics of the output of Canadian forest products are for 1910. According to these data the production of lumber, square timber, lath, and shingles was valued at \$83,987,197, of which \$77,503,187 represented lumber. Advance figures indicate that a larger quantity of pulp wood was used in Canada during 1911 than in any previous year. The total output of this product last year was 1,520,227 cords, valued at \$9,678,616, of which 672,288 cords, valued at \$4,338,024, compared with 598,487 cords, valued at \$3,585,154, for 1910, represented the home consumption. The shipments of pulp wood to the United States last year were valued at \$5,340,592, a decrease of nearly \$870,000 compared with 1910. The shipments of wood pulp to the United States amounted to \$4,872,790 as compared with \$4,901,899 for 1910.

**Population—Land Sales—Immigration.**

The population of Canada, according to the census taken in June of last year, was 7,204,527, of which 3,820,887 were males and 3,383,640 females. The rural population was 3,924,083, and the urban 3,280,444. During the 10 years ended 1911 the urban population increased 63.83 per cent, while the rural population gained only 16.48 per cent. The total increase in the population for 10 years was 1,833,212. The four western Provinces gained in population 174 per cent, while the five eastern Provinces gained only 17 per cent. In the older settled parts of Canada there was a decided movement from the farm during last year, some moving to western lands and others seeking homes in towns and cities. The disproportionate growth of urban population has resulted in a large increase in the value of town and city properties.

The land sales of the Dominion Government during 1911 numbered 1,030, representing 54,741 acres, and the average price was \$3 per acre. The total number of homestead entries during the year was 38,909. The entrants from the United States numbered 10,863 compared with 14,704 for 1910, of which 5,922 went to Saskatchewan and 4,633 to Alberta. The sale of land by the Canadian Pacific Railway Co. for the year ended June 30, 1911, was 650,874 acres, of which 19,097 acres were irrigated land. The irrigated land brought \$33.63 per acre and the other land \$14.11 per acre.

Immigration into the Dominion during 1911 reached a total of 350,374, an increase of over 15 per cent over the previous year. The arrivals from the United States numbered 131,114, a gain of 6,512 over 1910. Of the immigrants from the United States, Minnesota furnished 17,029, Washington 15,217, North Dakota 12,194, Massachusetts 12,000, Michigan 9,754, and New York 9,359.

**Subsidies and Grants to Railroads—Canal Traffic.**

The total railway mileage in Canada for the year ended June 30, 1911, was 25,400, an increase of 669 miles over the previous year. Of this gain, 70 per cent was in the western Provinces. The cash subsidies paid for railway construction in the Dominion up to the end of June of last year were as follows: From the Dominion, \$148,217,071; from the Provinces, \$35,919,360; and from the municipalities, \$18,042,823. The land grants to the railways totaled 55,256,429 acres, of which 32,004,486 acres were given by the Dominion. In addition to these subsidies and land grants, the Federal and pro-

vincial Governments have during recent years given material assistance by the guaranteeing of bonds valued at \$148,336,357. The average revenue per passenger per mile for the year ended June 30, 1911, on the Canadian railroads was 1.944 cents, and for freight per ton per mile 0.777 cent. [Further data on the Canadian railways were published in the Daily Consular and Trade Reports for Feb. 21, 1912.]

The freight traffic on the Canadian canals during the 1911 navigation season was distributed as follows in tons: Sault Ste. Marie, 30,951,709; Welland, 2,537,629; St. Lawrence, 3,105,708; Chambly, 599,829; St. Peter's, 75,298; Murray, 163,457; Ottawa, 320,071; Rideau, 172,227; Trent, 57,290; and St. Andrews, 47,135. Of the 38,030,353 tons representing the traffic through the several canals of the Dominion, 30,237,446 tons originated in the United States and 7,792,907 tons in Canada.

#### **Industrial Development.**

It is estimated that there are about 20,000 industrial establishments in Canada and the capital employed amounts to nearly \$1,000,000,000. The wages paid annually amount to over \$250,000,000, and the annual output of the establishments is valued at about \$1,000,000,000. The exports of Canadian manufactured goods last year were valued at \$34,500,000. Montreal is the principal manufacturing city in respect to capital employed and value of production, followed by Toronto, Hamilton, and Winnipeg.

Industrial activity was greater in the Province of Quebec than in any of the other Provinces, and the possession of immense water powers makes still greater development in manufacturing probable in the near future. The available water power in Canada is estimated at 17,000,000 horsepower. That developed in 1910, according to statistics recently published, amounted to 1,016,521 horsepower, of which 742,955 horsepower was for electrical energy, 158,051 horsepower for the paper and pulp industries, and 115,515 for other industries.

#### **Steamship Subsidies and Industrial Bounties.**

During the fiscal year ended March 31, 1911, the Dominion Government expended \$1,918,941 for mail subsidies and steamship subventions. The largest amount paid was \$600,000 for the service between Canada and Great Britain; \$180,509 was paid for the Canada and Australia (Pacific) service; \$146,000 for the Canada and South Africa service; \$100,000 for the Canada, Australia, and New Zealand (Atlantic) service; and \$193,750 was paid under special statute for service between Canada and France.

The total bounties paid by the Dominion Government for the fiscal year ended 1911, were \$1,597,663, and covered the following industries: Pig iron, \$261,433; steel, \$350,455; wire rods, \$526,858; lead, \$248,534; manila fiber used in binder twine and cordage, \$49,784; and crude petroleum, \$160,596. The bounties on iron and steel were paid to nine different companies. On June 30 of last year the bounty on wire rods expired. The only bounties now payable under Canadian statute are on iron and steel produced by electric process, lead smelted in Canada, crude petroleum, and manila fiber manufactured into binder twine and cordage. No operations, however, have been carried on under the provision for the production of iron and steel by electric process. Since the adoption of the bounty system in 1884 up to March 31, 1911, \$21,031,700 was paid in bounties.

**Charters for New Companies, Amalgamations, and Business Failures.**

During the calendar year 1911, 3,320 new companies secured Dominion or provincial charters, with a total authorized capitalization of \$1,148,554,783. These companies were distributed among the following Provinces: Ontario, 1,078; British Columbia, 684; Quebec, 509; Alberta, 495; Manitoba, 290; Saskatchewan, 215; New Brunswick, 45; and Nova Scotia, 4.

According to a financial publication there were 41 industrial amalgamations in Canada during the three years ended December, 1911, 39 of which had an aggregate authorized capitalization, including bonds, of \$334,938,266.

According to Bradstreet's agency, the number of business failures in 1911 was 1,401, involving assets of \$6,420,331 and liabilities of \$13,086,946. The failures in 1910 numbered 1,262 with liabilities amounting to \$14,514,650.

**Strikes and Lockouts and Building Operations.**

The total number of strikes and lockouts in Canada last year was 104, compared with 87 in the previous year. Of those last year, 33 terminated in favor of the employers, 23 in favor of the employees, in 21 cases a compromise was effected, and 27 cases were not settled at the end of the year.

Building permits issued in 10 Canadian cities having the largest building records gave an aggregate total value for last year of \$107,644,191, against \$94,129,432 in 1910 and \$64,509,620 in 1909. Toronto led with permits valued at \$24,374,539, followed by Vancouver with \$17,652,642, Winnipeg \$17,550,000, Montreal \$14,579,952, Calgary \$12,907,638, Regina \$5,099,340, Hamilton \$4,255,730, Victoria \$4,126,315, Edmonton \$3,672,260, and Ottawa \$3,425,775. All the foregoing, except Montreal, show an increase over 1910.

**Clearing-House Returns, Canadian Revenue, and Banking Operations.**

The clearing-house returns for the Provinces during last year amounted to \$7,385,470,053, compared with \$4,321,441,616 for 1907. The Province of Quebec led with \$2,503,807,021, followed by Ontario with \$2,298,808,410, Manitoba \$1,200,192,716, and British Columbia \$678,414,170. The city showing the greatest clearance was Montreal with \$2,370,487,623, followed by Toronto with \$1,852,397,605, and Winnipeg \$1,170,763,642.

The revenue of the Dominion for the nine months ended December 31, 1911, was \$99,482,947, made up as follows: From customs, \$64,103,989; excise, \$14,243,524; public works (including railways and canals), \$8,883,874; post office, \$7,150,000; and from other sources, \$5,101,559. The total revenue for the same period in 1910 was \$85,665,833. The total net debt of the Dominion on December 31, 1911, was \$313,386,651, or \$13,499,308 less than for the same period the preceding year.

The paid-up capital of the 29 Canadian chartered banks at the end of 1911 was \$107,994,604; the reserved fund, \$96,868,124; bank notes in circulation, \$102,037,305; specie held, \$37,464,226; and their total assets \$1,390,069,518. Two new banks commenced business during 1911, La Banque Internationale du Canada, with authorized capital of \$2,000,000, and the Weyburn Security Co., capitalized at \$1,000,000. It is claimed that the first institution is backed by about \$7,000,000 of French capital.

**SIBERIAN ROUTE TO HONGKONG.**

[From Consul General George E. Anderson, Hongkong, China.]

There seems to be a well-defined impression among American exporters that in many respects the United States has the advantage of Europe in transportation and communication with China and the Far East. At one time this was largely the case, but the advent of the Siberian Railway has revolutionized the situation and, so far as mail and express communication is concerned, Europe now has an immense advantage over the United States in its relation to South China, as well as to North China and Japan.

With regard to freight connections the Pacific coast of the United States and the average European port have about the same advantages with respect to Hongkong. North and west of Hongkong in China and in Japan freight by water communication from the west coast of the United States has a great advantage over that from Europe. South and west of Hongkong the advantage is with freight from Europe instead of that from the Pacific coast. However, even in this respect the advantage of the United States in Japan and Central and North China at present is more apparent than real, for the vast mass of freight from the United States for this part of the world is from the Eastern and Southern States and must be brought overland to the Pacific coast at great expense or taken to the east coast and shipped by way of Suez.

**Mail Service Comparisons.**

For mail by sea Hongkong also is substantially the dividing point of advantage between Europe and the United States. Mail from Paris and London for Hongkong via the Suez Canal arrives here in substantially the same time it does from New York and Washington, say 32 days on an average. About once a month the United States has a mail by way of Canada's subsidized mail line arriving here in about 27 to 28 days from New York. In mail by sea the United States has the advantage of Europe in all parts of the Far East north and east of Hongkong. However, this advantage has been lost in the development of the Siberian mail service.

At present not only has Europe the advantage of the United States in mail communication to China and Japan, but the United States itself, with the sole exception of the Canadian service referred to and excepting only Pacific-coast letters mailed on sailing days, can send mail more quickly and more directly by way of Siberia to Hongkong than by trans-Pacific steamer, and of course all the Chinese and Japanese cities to the north of Hongkong have all the more advantage in mail connection with Europe by the Siberian route. Mail is now sent from Hongkong to London or Paris or other European points three times per week in 16 to 17 days. The added time for connections and a trip across the North Atlantic to the United States still brings the transit period within that taken by the trans-Pacific route, besides having the added advantage of much more frequent service.

The increase in the amount of Hongkong mail now going by the Siberian route has been so great that, since the cost of sending mail by that route is greater to the Hongkong post office than it is by the all-sea route, aggregating 22 francs per kilo or \$1.93 gold per

pound, there has been a decided change in the Hongkong post-office budget and the subject has caused considerable discussion in the Hongkong legislative council. Probably nine-tenths of the originals of letters from Hongkong business men to the eastern United States now go via Siberia, the seconds going by the trans-Pacific route. It is significant that, while the leading American firms in eastern United States dealing with China send replies by the same route, the great mass of American correspondence still comes by the trans-Pacific route, as in former days. The advantage of the quicker route by way of Siberia needs to be better appreciated in the United States.

#### **Quick Traveling Time Between Orient and Occident.**

The trans-Siberian route development is a matter of world-wide importance. While its further betterment by short-cut railway lines is planned and will doubtless soon be realized, present possibilities have not been neglected and the time of transit for mails has constantly been shortened. The 7,443 miles from London to Vladivostok is covered regularly in 11 days. The journey from London to Japan by through trains, with complete sleeping and dining cars, is made ordinarily in 14 days and less. The trip from Peking to London is made in 12 days. The trip from London to Shanghai is made usually in 14 days, and from London to Hongkong in about 17 days. The trips in the opposite direction are practically upon the same schedule.

When the cut-off line from the present Kalgan railway line to the trans-Siberian system at Kiatka is completed, the time from London to Peking will be reduced to 9½ days. In 1909 the trip from Moscow to Vladivostok and Peking was reduced by 5 hours. In 1911 the train de luxe was speeded up so as to cover the route in one entire day less. With the completion of present railway improvements in Manchuria the trip to Japan will be shortened 2 days, a reduction probably to be realized the coming summer. At the same rate and with the Kiatka line complete, the trip from Paris to Peking will be made in 8 days. Even at present the service by rail to Central China and to Shanghai and the coast ports by steamer or rail is far ahead of anything to be expected by the trans-Pacific route now or indefinitely in the future.

The present service across Siberia is of practical importance to American business men even dealing with South China, and it should be utilized not only in mails to North and Central China but to Hongkong as well.

---

#### **ANOTHER JAPANESE LINER.**

[From Consul Carl F. Deichman, Nagasaki.]

The *Yokohama Maru* built at Nagasaki, for the Nippon Yusen Kaisha, had its official trial trips on April 20, and developed an average speed of 15.167 knots and a maximum speed of 15.369 knots per hour. The vessel was turned over to the owners on May 15, and will be employed on the Seattle-Hongkong Line and receive a Government subsidy [under the schedule described in Daily Consular and Trade Reports for Mar. 12, 1912]. The vessel is designed primarily as a freight carrier, but has accommodation for 28 first-class and 216 steerage passengers.

**TRADE OPENINGS AT CUZCO.**

[By Commercial Agent Frank R. Rutter.]

It was only three years ago that Cuzco, Peru, was first united by railroad with Arequipa and Mollendo. And with the coming of the railroad there has begun, or at least become apparent, the leveling movement which threatens to destroy in time the picturesqueness of the old Inca city, while at the same time it brings to the inhabitants many of the comforts and labor-saving appliances of modern civilization.

The Indian inhabitants of the town live in little houses with doors and windows opening on the sidewalks. Many of the people keep small shops and, while waiting for customers, may be seen industriously sewing, chiefly on hand sewing machines. Scarcely a house seems to be without its sewing machine, and the well-merited success of the agents in this line points the way to the introduction of other labor-saving devices. The general use of the sewing machine is the result of a carefully planned campaign that has extended over a decade. The trade in southern Peru is now profitable, but it was built up only after many years of effort and, doubtless, of preliminary loss.

The town of Cuzco has a population variously estimated at from 20,000 to 30,000, of whom the vast majority are Indians with simple wants and slow to change the habits which have been followed for centuries. New wants can be created and new methods taught only by actual and repeated demonstrations of the advantages offered, and such demonstrations are necessarily extremely costly. It is said that the Indian can live on a few cents a day. He eats the produce raised in the surrounding country and until recently clothed himself with homespun garments made from wool and the hair of the llama and similar animals, dyed with lasting native colors. Within the last few years cheaper dyestuffs have been provided by commerce, and coarser grades of cottons are now competing with the native woollens.

**Character of Goods That May Be Introduced.**

The commercial importance of Cuzco is not limited by the number of its inhabitants. It is the market place for a vast territory still untouched by railroads, although the construction of several in different directions is under consideration; on the back of llamas and burros the agricultural and mining wealth of the surrounding districts is brought into the town and exchanged for such commercial products as the market affords.

Coca (from which cocaine is obtained), cocoa, sugar, rice, and coffee are the chief farm products of the region. The most primitive implements are in use both in the cultivation and harvesting of the crops and in preparing the produce for the market. It is believed that a considerable market could be built up for improved appliances, provided that these were not too expensive and not too complicated for general use. Apparatus for drying coca leaves (the product shipped abroad in largest quantities), for preparing cocoa or cacao, and for extracting sugar are especially in demand. With the abundance of fruits and cheap wages canning might profitably be introduced, and machinery for such establishments be imported. Similar advantages exist for erecting slaughterhouses and soap factories. The demand for apparatus for such purposes may become effective in time, but

the need of better machinery for the agricultural industries already established is a present and pressing one which it is desirable that American manufacturers shall meet before machinery makers from other countries enter the field.

#### **Apparatus Needed for Drying Coca Leaves.**

The drying of coca leaves particularly is primitive in the extreme. The leaves are kept under shelter until there is good prospect for continued clear weather. Then they are dumped into the courtyard, which is usually paved with Belgian blocks, and for at least a week the leaves are swept around with brooms until they are sufficiently sun dried. The admixture of dirt and other impurities which results from this method can easily be imagined. Some practical method of artificial drying, if not entailing too great expense, would be welcomed by the more progressive farmers and once introduced could doubtless be brought into general use.

No one should attempt to enter the field, however, unless willing to stand some loss until his appliance becomes generally known. It might even be necessary, and would certainly be desirable, to keep a resident agent on the ground to supervise the installation, to give practical instructions in operating, and to make repairs.

A beginning has been made in the sale of improved farming implements. American typewriters are in demand, but their sale is limited by the number of establishments that carry on extensive correspondence. A similar field exists for office furniture.

#### **Lack of Consular Representation.**

The American exporter is at a distinct disadvantage compared with the German, French, Italian, Spanish, and Belgian exporter through the absence of any consular representative to report on the needs of the market and to inform him of any special trade opportunities that may arise. There is no American consular agent even at Arequipa, where most of the leading exporting countries are represented by prominent merchants, acting in the capacity of vice consuls. The nearest American consular agent is at Mollendo, 500 miles away, a distance that requires three days of travel by rail, and can be covered within that time only once a week.

---

### **CUBAN NOTES.**

[From the Cuba Review.]

*A milk-pasteurization plant* at Cardenas is a new Cuban enterprise. It delivers milk in quarts, pints, and half pints at 13, 7, and 4 cents, respectively.

*Electric light plants* are projected for Calabazar Mata and Quemados de Gumes in Santa Clara Province to supply public and private demand for electric lighting.

*Trolley extensions.*—General Manager Frank Steinhart of the Habana Electric Railway Co. made formal application for a permit to begin the construction of two new important electric lines within the city.

*Golf* has been introduced in Cuba, the Country Club of Habana having a suburban tract of 125 acres on which a 9-hole course has been laid out. This will be extended to 18 holes. [The names of Habana dealers in sporting goods may be found in the World Trade Directory.]

*Farm colonies.*—The Veterans' Association has selected 100 caballerias (33,333 acres) in the Manzanillo and Guantanamo districts in Oriente Province for division among farmers who are veterans. The lands will be reserved by the State and delivered to the veterans, provided Congress authorizes the transfer.

**VENEZUELAN BUSINESS NOTES.**

[From Consul Thomas W. Voetter, La Guaira.]

**Telegraph Line Extensions.**

The telegraphic system of the Government has been extended to Ocumare de la Costa, the point between the La Guaira and Puerto Cabello, toward which the new road from the interior is being constructed.

During April the duplex system of telegraphy was established on several of the principal lines of the Government, and this system will be extended to the following places: Maracaibo, Barquisimeto, Trujillo, Merida, Rio Chico, and Cumana. The Ministry of Fomento has been authorized to purchase the necessary instruments for the service and to construct direct lines between Trujillo and Valera and between Rio Chico and Cumana.

**Automobile Freight and Passenger Line.**

The Government has given to J. M. Alamilla Ramos the exclusive right for 20 years to transport freight and passengers by automobiles or steam motors between San Felix, Upata, Guasipati, El Callao, and Turemero. He may use the present wagon road and must keep it in repair. The ordinary traffic by carts and mule trains is not to be interfered with. The free entry of machinery, tools, fuel, vehicles, etc., which the enterprise will need, is granted by the Government. There shall also be no national taxes imposed, and the enterprise shall also be privileged to use what national land it may need for buildings and to cut timber along the right of way on national lands for the service, repair of bridges, etc. The service is to be installed within a year after the approval of this contract by Congress. The address of the concessionaire is care Hotel Klindt, Caracas.

**Change in Contract with Navigation Company.**

The concession of the Compañía Anónima de Navegación Fluvial y Costanera is about to be modified according to a new contract between that company and the Venezuelan Government. The company is to renounce those parts of its concession which refer to the contracts of April 30, 1908, and July 17, 1909, with Andres Rodriguez Azpuru and Moises Salas, respectively, and also that part of its contract of June 7, 1911, which refers to the exploiting and colonization of the Territory of Amazonas. In the future it will maintain four different steamer services:

(1) A line starting from Ciudad Bolivar, which shall touch at points on the Orinoco and its tributaries, the Apure, Meta, Arauca, Apurito, Caura, Masparro, Portuguesa, and Cojedes; (2) a line starting from Ciudad Bolivar through the mouths of the Orinoco, preferably those of Macareo and Pedernales, reaching to Port of Spain, Trinidad; (3) a line starting from Ciudad Bolivar, which shall end at Maracaibo, touching all the ports on the coast; (4) a line to navigate the Lake of Maracaibo and its tributaries.

The company has the right to establish radiotelegraphic apparatus in its ships and to establish telephone and telegraph as well as wireless stations in those points not covered by other services or by previous concessions.

One innovation is the reservation by the Government of anything which may be related with the canalization of the bar at the entrance of Lake Maracaibo, the Government retaining the right to contract for this work separately.

**Drought Causes High Prices for Foodstuffs.—Locust Plague.**

On account of the prolongation of the drought from which this part of Venezuela has been suffering the amount of cereals and other foodstuffs available for food has been growing less and prices have accordingly advanced on many of the prime necessities. A comparison of the wholesale prices at Caracas on November 13, 1911, and May 13, 1912, will show the range in prices. The quotations are for 100 pounds and the prices are in "pesos sencillos" of 4 bolivars each (bolivar equals 19.3 cents).

Articles.	Nov. 13, 1911.	May 13, 1912.
Polished rice.....	\$7.25	\$8.25
Common rice.....	6.50-6.62	7.75
Sugar, first guatire.....	12.50-13.00	17.50-18.00
Sugar, second guatire.....	11.50	16.00-16.50
Starch, guatire.....	5.75-6.00	10.50-11.00
Beans, black <sup>1</sup> .....	12.00-12.50	19.00
Beans, white <sup>1</sup> .....	14.00-15.00	17.00
Corn, white, new <sup>2</sup> .....	5.12-5.25	9.50
Corn, yellow <sup>2</sup> .....	6.25-6.50	9.50

<sup>1</sup> Per 216 pounds.<sup>2</sup> Per 212 pounds.

There have been requests to the Executive that the import duties on cereals be taken off in order to reduce the cost of food, but no action granting these requests has yet been taken.

Caracas newspapers state that in the State of Trujillo locusts have appeared in such large numbers and are doing so much damage that public aid is necessary to combat them and that a Government appropriation of \$1,200 has been made therefor.

**Lighthouse Repairs—New Laboratory—Glass Factory—Silk-Goods Trade.**

Repairs are to be made at the lighthouse on the islands Los Roques at a cost of \$1,190, which will include a new acetylene apparatus and replacing glasses in the lantern.

The president of Venezuela decrees the establishment of a laboratory of agricultural chemistry and biology in the Station of Seeds and Plants operating under the Ministry of Fomento; \$500 is appropriated for the first apparatus. The laboratory will afford a place for chemical analyses of soil, waters, fertilizers, and farm products, also for bacteriological investigation of animal and vegetable diseases. [The plan for a Federal agricultural school appeared in Daily Consular and Trade Reports for May 14.]

Fabrica de Vidrio y Cristal, of Caracas, has been granted one year's exemption of customs duties for importing the following articles: Machinery for making bottles, accessories for making objects of glass-ware, Glauber's salt, calcareous spar, soda, borax, pulverized marble, oxides, white sand, and clay.

American silk goods should find sale in this country. One merchant, however, states that recently he desired to send an order to the United States, but that the dealers there would not comply with his shipping directions. He stated that he desired to have the goods come by parcel post, as the shipping and entrance fees were less on shipments coming that way. He therefore desired the silks cut in pieces of 10 yards in order that the packages might come within the weight limits. He could not obtain compliance with his requests and did not order the goods. He wished to buy the full bolts, of course, but to have them cut before shipment to him.

**BRAZILIAN DEVELOPMENT NOTES.**

[From the Review, Rio de Janeiro.]

*Construction enterprise.*—The Cia Constructora de Santos, capital \$130,000, has been formed at Santos to build houses and deal in land.

*Cotton mill.*—The Cia Para Industrial, capital \$65,000, has been formed in the city of Para, State of Minas Geraes, for establishing a cotton mill.

*Engineering.*—Decree 9510 authorizes the Amazonas Engineering Co., capital \$250,000, domicile England, to undertake all kinds of engineering work in Brazil.

*Mining.*—The Central Brazilian Trust Co., capital \$250,000, has been registered at Somerset House, London, to work mining and other concessions in Brazil.

*Caloric enterprise.*—Decree 9512 authorizes the Caloric Co., capital \$100,000, of Goshen, N. Y., U. S. A., to operate in Brazil, the object being to extract oil and its products.

*Fine-arts building.*—The Secretary of the Interior has signed a contract for the completion of the fine-arts building in the Avenida, within a space of four months, for \$22,000.

*Meat distribution.*—The Cia Frigorifica Paulista is raising its capital to \$1,000,000 for supplying meat to the States of Sao Paulo, Minas Geraes, Goyaz, Matto Grosso, and Rio de Janeiro.

*Cold-storage depots.*—Decree 9505 authorizes the Empresa de Armazens Frigorificos, capital \$400,000, domicile Rio de Janeiro, to erect and manage cold-storage depots in Rio and other cities.

*Structural steel.*—Advices from London state that the Anglo-Brazilian Steel Structural Importing Co., capital \$375,000, has been formed there. Offices are to be opened in Sao Paulo and other Brazilian cities.

*French enterprises.*—The Banque Française pour le Brésil et l'Amerique de Sud, capital \$1,000,000, head office, Paris, is asking for authorization to operate in the Republic, as is also the Compagnie Assurance Générale, likewise domiciled in France.

*Public works.*—The Maceio Improvements Co. is issuing in Paris \$3,400,000 in 5 per cent debentures. The object is the improvement of the drainage system, water supply, lighting, and tramway service of the city of Maceio, capital of the State of Alagoas.

*Oil exploitation.*—The Standard Oil Co., of Brazil, capital \$500,000, has been authorized to operate in the Republic. The domicile of the company is in Fairmont, W. Va., U. S. A. The purpose of the company is to acquire oil-bearing fields and exploit the petroleum industry in Brazil.

*Russian line to South America.*—The directors of the Russian Volunteer Fleet are reported to be completing plans for establishing a regular line between Odessa and South America. Gen. W. N. Kisaeff, representing the company, is now on his way to South America to visit several ports there. The Russian Government has already given its sanction for the new line.

*Sao Paulo Railway.*—A cable from London states that negotiations are in progress between this company and the Sorocabana Railway for the purchase of the former by the latter. The Sao Paulo Railway

has maintained its dividend, including bonus, for the year 1911 at the 13 per cent level of the three preceding years. The company's total reserve and other funds amount to about \$10,000,000.

*Gas profits.*—The Sao Paulo Gas Co. shows profits for 1911 of \$329,000, and a dividend of 6 per cent, free of tax, has been paid on ordinary shares, making 12 per cent for the year. The company's installation of high-pressure lighting in the grounds of and streets adjacent to the new Municipal Theater, inaugurated on September 7 last, has proved a complete success. The large increase in gas consumption by private consumers, both for lighting and cooking purposes during the past year, is especially noteworthy, showing that as the city expands in area, population, and general prosperity, so will the business of the company go on increasing year by year.

*New hotel.*—Plans for the new Ritz Carlton Hotel submitted to the president of the Republic call for a triangular building, the apex of which will be at the corner opposite the Frigorifica, and the bases, one at the corner of the Rua Senador Dantas, and the other opposite the monument in front of the theater. A street will run obliquely from the corner of the Rua Senador Dantas to the Avenida. The main entrance to the hotel will be in this street, and will be very much like the Carlton in London, as it will give on to a palm court which will lead to the main dining room, the table d'hôte, the grillroom, and the rest. There are to be 500 bedrooms and 150 suites with bathrooms. There are to be eight floors, so the proportions of the building should be imposing. It is expected that the hotel will be ready for occupation in about two years.

---

### CONDITION OF CUBAN SUGAR CROP.

[From Deputy Consul General Henry P. Starrett, Habana, May 14.]

The outlook for a large crop of sugar cane for the present season is very good, especially if the present dry weather conditions are maintained for a few weeks longer. The extremely favorable weather of the past two months is responsible for the continued grinding and consequent larger output of sugar. Up to the present there has been a total production of 1,487,081 tons of sugar with 150 mills still grinding. Last season at this time there was a total production of 1,302,552 tons with only 37 mills grinding. In view of these figures and reasonable weather it would seem that Cuba's output of sugar for this season should easily reach 1,750,000 tons. [Weather conditions in Cuba up to June 3 have continued favorable for grinding cane.—B. of M.]

---

### URUGUAYAN REGULATION FOR PASSENGER VESSELS.

[From Consul Frederic W. Goding, Montevideo.]

A Uruguayan decree of February provides that all vessels taking on and discharging passengers at this port, enjoying packet privileges, which do not enter the anteport, shall be penalized by the loss of such privilege for six months for the first offense and permanent loss for a repetition. This requirement has been made because on a number of occasions, during rough weather, a number of passengers have been nearly drowned during transfer.

## FOREIGN TRADE OPPORTUNITIES.

(Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.)

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8946. Brass and copper tubing.**—An American consular officer in Canada reports that a company in his district desires to be put in touch with American manufacturers of all gauges of sheet brass, all gauges of sheet copper, brass and copper tubing, and braised brass and copper tubing. Correspondence with this firm should be in English.
- No. 8947. Rubberoid.**—A business man in a European country informs an American consular officer that he desires to be put in communication with American manufacturers of rubberoid with a view to representing them locally. This person handled large quantities of this material while in the Far East, and he is of the opinion that it could be largely introduced for roofing and bath-room flooring in the country in which he is now located. Samples, prices, discounts, and terms are desired.
- No. 8948. Sewing machines.**—Several large wholesale merchants in an Asiatic city have requested an American consul to put them in touch with manufacturers of sewing machines. These firms are willing to accept an agency in this line. American manufacturers of this line of goods should send illustrated catalogues and prices c. i. f. city of destination. All quotations should be given in English currency. The same information should also be sent to the consulate submitting the report.
- No. 8949. Topazes and mining machinery.**—A chamber of commerce in the United States writes the Bureau of Manufactures that one of its members residing in South America desires to find a market for pink and yellow topazes now regularly sent by him to Germany. If these stones could be sold in the United States it would facilitate his purchasing mining machinery and supplies. Samples of the gems may be seen at the office of the association.
- No. 8950. Passenger and freight elevators.**—An American consular officer reports that a resident of his district, who, it is understood, represents the contractors who are to erect a new terminal of a certain railway, is desirous of being brought into touch with American manufacturers of passenger and freight elevators and of receiving advertising matter in connection with the project now in hand.
- No. 8951. Building materials.**—A report from an American consular officer in a Latin-American country states that a firm in his district is desirous of securing the agencies of manufacturers of various building and construction materials, especially cement and structural iron and steel. Communications may be addressed in English.
- No. 8952. Automatic railroad ticket stamping machines.**—A business man in Spain informs an American consular officer that he would like to correspond with manufacturers of automatic railroad ticket stamping machines that he may secure the agency for the same. Correspondence should be in Spanish or English.
- No. 8953. Insurance agencies.**—An American consular officer has forwarded a letter from a business association in the Near East expressing a desire to get in touch with American insurance companies with a view to representing them in that region. The letter states that the present is a most opportune time for the establishment of agencies, and there is a vast field open to American companies writing fire, life, marine, and accident insurance. The latter form of insurance is practically unknown at present, and companies would do well to enter the field at once. Further particulars regarding this matter contained in the report will be sent to interested firms by the Bureau of Manufactures.
- No. 8954. Portable iron houses and iron bedsteads.**—A merchant in a Mediterranean country has informed an American consulate that he would like to be put in touch with American firms exporting portable corrugated iron houses suitable for warm climate. The same merchants also desires to be put in touch with American exporters of iron bedsteads. Correspondence in English.
- No. 8955. Sulphur oil.**—An American consul reports that a merchant in Greece desires to secure a reliable American firm to represent him as agent in the sale of sulphur (olive) oil in the United States. Correspondence in English.

## EXPORT PACKING.

### CHINA.

[From Deputy Consul General J. K. Davis, Shanghai.]

The countries that have met with commercial success in China are those whose merchants, with a sincere desire to win and hold this market, have studied all its vagaries and have made such concessions as have been found necessary not only to satisfy the importer but also to insure the arrival of merchandise at destination in approximately as good condition as it left the factory.

In the past the attitude of most American manufacturers has been one of indifference toward the Chinese market, the idea seeming to have been that it was merely an outlet for surplus stocks, that there was little permanency to lines, that anything was good enough for the Chinese, and that if packing and methods passed muster in America they must be sufficient for China. Nothing is farther from the mark than that anything is good enough for China. As a matter of fact, the native merchant is a keen business man who knows exactly what he wants, how he wants it, and always has a good reason for wanting it so. He is familiar with local conditions, the hardships of handling, the climatic changes, and facilities for transshipment inland, and when he expresses a desire for some special packing it is because one at least of the unusual conditions demands it.

### Improvement in American Packing—General Requirements.

The consensus of opinion among Shanghai importers to-day is that American packing is improving greatly, especially that done by important export houses which have taken the trouble to study the peculiar demands of the Chinese market. In fact, in many of the staple lines, such as kerosene, tobacco, and certain kinds of machinery, American packing is said to be even superior to that of other countries. That done by firms new in the Chinese trade, or which make only occasional shipments, is usually of a very insufficient character and frequently results in serious inconvenience and loss to the consignee.

A common complaint against the American packer is his disregard of the suggestions and requests of the purchaser for special packing. British and other European exporters usually adhere closely to instructions and make every effort to adapt their methods to the needs and wishes of the local trade. Suggestions by experienced importers in Shanghai are made for good and sufficient reasons, and disregard of them usually ends in the exporter's elimination from this market.

To put it generally, merchandise destined for China should be packed with a view to standing the hardest usage on the longest of voyages. Transshipping is frequently necessary; and if an interior market is the ultimate destination the merchandise, after landing in China, must undergo several additional transfers by primitive methods. In the absence of drays and trucks all freight is transferred suspended by ropes from heavy bamboos on coolies' shoulders, on wheelbarrows, and carts, or, if not too weighty, directly on the coolie's back. The merchandise frequently receives very rough treatment at the hands of these carriers. It is a common sight to see a large, unwieldy case rolled end over end down a slope without any effort being made to ease the impact or a load dropped from the coolie's back to the ground. Goods susceptible to damage from damp are frequently left out in the rain while the coolies, who are extremely sensitive to water, seek protection in some near-by doorway.

#### **Climatic Conditions—Pilfering.**

Climate must also be taken into consideration. This district is damp and humid, and all goods affected by mold or rust should be specially protected by oiled coverings, while metallic surfaces should ordinarily be well covered with grease or waterproof shellac. During what is known to the natives as the "yellow moldy season," the rapidity with which leather goods mold and tin and other metallic surfaces rust is almost incredible.

Another considerable reason for strong packing is the pilfering in godowns, or native warehouses. This is generally limited to removal of the outer fastenings, such as ropes and iron bands, but where cases are already broken or are easily breakable, the contents not infrequently suffer also. It is probable that no amount of care in packing can entirely prevent this, yet strong, well-nailed, iron-banded boxes are more immune than those which burst when merely dropped on the floor at a certain angle. Cases whose marks do not reveal their contents are much more likely to be immune than those bearing on the cover a description of the wares inside. It is probable that placing a description of the contents on the exterior of a package in English does little or no good as a means of advertisement. A descriptive "chop," or trade-mark, that the general public could recognize without deciphering might give the box some value as a medium of advertising.

#### **Size, Numbering, and Marking of Cases.**

It is essential that American exporters adhere closely to buyers' instructions regarding the size, numbering, and marking of cases. Foreign merchandise arriving in Shanghai is subject to the Chinese customs duty, but when reexported to a foreign port, such as Manila, Hongkong, Weihaiwei, Tsingtau, Vladivostok, or Nagasaki, in the

original package, such duty is refunded by means of a drawback application. If, however, the case is unnumbered or is too large, so that the importer has to repack the contents into smaller compass he will lose the right to such drawback. It will be readily seen how serious may become any disregard of instructions as to size of case and numbering.

Cases that are too large also increase the cost of handling, as they can not be readily transported by the usual bamboo and wheelbarrow; those too heavy for four coolies to carry are handled with great difficulty and consequently are much more likely to receive rough treatment.

Merchandise generally moves inland by boats, which are of a certain width and length. Cases built to the proper dimension fit nicely into the cargo space, utilizing practically every inch contracted for. Other boxes as a rule do not fit and the shipper finds himself

American and British bales of piece goods.

paying for waste freight space, which does not please him, for the native is an extreme economist. The exporter who regards the importer's requests seriously and helps him to save a few feet of cargo space will get his orders.

The foregoing observations apply to all classes of merchandise shipped to this country. In the following I shall discuss the packing of some of the principal articles imported from the United States, pointing out wherein existing methods are unsatisfactory and how they may be remedied.

#### **Packing of Piece Goods.**

The most serious criticism concerns piece goods, the American packing of which has never been what it should be, and importers state that it is gradually becoming worse. The average bale consists of 20 bolts wrapped with a single cover of a very poor, brittle paper,

with an outer covering of single burlap, well roped. British goods are first incased in two layers of strong paper followed by a covering of heavy oiled or tarred cloth, and an outer layer of burlap or hessian cloth strongly bound with iron straps, which are put on many bales in addition to roping. Some of the British bales have along the four lateral edges wooden strips, which serve to distribute the pressure and greatly strengthen the bale. The Japanese, who in other respects pack their bales like the British, place on each lateral edge a quarter of bamboo, which, owing to its unusual toughness, is an improvement.

The difference between American and British packing of piece goods is strikingly shown by the illustration. The American bale (on the left) has (1) an outer single cover of burlap and (2) an inner cover of brittle paper. The British bale has (1) an outer layer of burlap covering both bales, (2) inner layer of burlap covering the individual bales, (3) tarred burlap covering each bale which sticks together at the edges in such a way as practically to seal each bale against moisture, (4) heavy outer paper cover, (5) heavy inner paper cover. The figure 6 indicates the end of the wooden strip that runs down the lateral edge beneath the outer burlap.

Most of the piece goods arriving in Shanghai find their way to interior ports, and while the American article, if not exposed to dust and rain en route, usually reaches this port in fair condition, it rarely survives the vicissitudes of carriage through the interior. The cheap brittle paper around the bolts breaks probably as soon as the ropes are drawn tight and dust sifts in through the burlap during the journey from the mills to Shanghai. No waterproofed paper being used, the first rain to which the bale is exposed on the open wharves of Shanghai or other points in transit to the interior carries this dust in unsightly streaks through the goods. The strips of wood or bamboo about the edges of the British and Japanese bales serve to hold the bales together when most of the ropes or straps have been purloined, and even when strips, ropes, and straps have all been removed the inner construction of the packing is generally strong enough to insure the goods reaching their ultimate destination undamaged.

#### **Machinery and Automobiles.**

Machinery imported into Shanghai from the United States is sent principally by large concerns, which, as a rule, take pains to pack with sufficient care to guarantee their wares reaching the consignee in good condition. Those who have not had the experience or have not benefited by that of others should remember that machinery for China should be much more strongly packed than for domestic trade, since the handling received by large, heavy cases is rough in the extreme.

To facilitate easy handling and minimize chances of breakage cases containing machines should be as small as possible. All parts should be snugly tight in the case or crate, as the least bit of movement may result in serious damage. Pieces of irregular form should be braced at every curve and angle, the box itself being reinforced inside and out to prevent its going to pieces if suddenly dropped. A very important precaution is the covering of the machinery itself in such a way that if the cases are exposed to rain the contents will not get wet, and it is advisable to cover all metal parts with vaseline or similar substances to prevent rust.

Automobiles from the United States are, as a rule, well packed, but improvements are possible. The most successful method seems to be to remove the wheels from the car and place the body on a stout platform, which becomes the bottom of the case, encasing each axle firmly in a strong wooden block bolted to the platform. A frame is then set up and the car planked in, the wheels being bolted securely to the interior side of the case. The frames of cases used for motor cars are usually strong enough, but it is said that the sides and top, which are made of 1 by 6 inch boards, are inadequate because there are no reinforcements, and crushing results when small heavy cases are rested or stowed upon them in the ship's hold. A few 2-by-4's at intervals of, say, 4 feet, should go far to prevent this. The cases should be lined with oiled paper or cloth as a protection against dampness, and metal parts liable to rust during the journey should be greased, two precautions quite necessary for this trade.

In some instances other goods have been placed in with motor cars. Importers strongly object to this, as the added weight increases the strain on the large surfaces and renders the cases more liable to breakage.

**Stoves, Ranges, Hardware, Tools, Nails, etc.**

Stoves and ranges from the United States are supplied usually by firms with long experience in the market, and they are generally well packed. Cases or crates should be strong and well strapped with iron at the ends, each article or part being so wedged as to prevent movement. Each package should also be as light as possible. For example, if a steel range is being shipped, the warming closet should be packed in one crate, the range proper in another, while lids and other loose pieces should be placed in a solid case with sawdust or other material added to prevent contact. All crates and cases should be lined with strong oiled paper as protection against rain and dampness.

Because of its weight, hardware should be packed in as small compass as practicable and in cases that will stand rough and frequent handling. Protection against damp should be supplied and close attention paid to the requests and suggestions of buyers, which, it is claimed, are frequently overlooked in these lines, the exporter insisting upon employing methods that, while suitable to the home markets, are not adapted to local needs. I have also heard it asserted that in this and other lines the American exporter makes a charge for marking packages with the importer's "hong" (firm) name in Chinese characters, although stencils for this purpose are supplied by the importer. European shippers make no charge for such marking.

Nails should be packed in strong kegs bound with four or five steel hoops and with reinforced ends; otherwise there is considerable breakage in every shipment, the loss ensuing from pilfering and other causes falling upon the foreign importer or the native dealer who buys from him.

Sheet iron should be shipped in packages of about 560 pounds, the sheets being bound together by 1 by 3 inch slats, five across each side, and the ends of each joined across the edges by steel hoops. With flat sheets it is necessary to run a slat lengthwise on each side to hold the transverse ones in place, but with corrugated sheets these

are not essential. It is specially important that the slats be strongly joined; otherwise the stealing in warehouse is considerable.

Tin sheets usually arrive in excellent condition. They are packed in five-eighths inch cases, tin lined and iron strapped, their weight varying from 90 to 120 pounds.

#### **Slates, Leather, Shoes, and Typewriters.**

Importers state that school slates from the United States frequently arrive in bad condition, because the ends of the cases, which are otherwise adequately strong, are too thin and not properly reenforced. Sometimes extra strips are placed on the outer edges of the ends, but these, while greatly strengthening the cases as a whole, leave the middle of the end, the most vital point, unreenforced and breakage results.

Leather should be packed in cases; when handled in bales the ends are frequently so battered and spoiled as to render it unsalable. Patent leather should always have waxed or oiled paper placed next to the finished surface, as the heat or the dampness it undergoes while coming out via Suez or Honolulu and after reaching Shanghai may cause it to stick and scar.

Among the importers of American shoes there seems some difference of opinion as to the efficiency of American packing, but it is gratifying to find the largest importers more than satisfied. If the shipper wishes the consignee to receive his cargo in satisfactory condition he must pack to protect against dampness, and have the cases stout and iron banded to prevent breaking and to give greater immunity from depredations in warehouse.

As a rule, American typewriters reach here in excellent condition. It is necessary to coat all rustable parts with vaseline or other similar substance to prevent deterioration before unpacking.

#### **Tinned Goods.**

With a few conspicuous exceptions the packing of American tinned goods does not compare favorably with European packing, and leaves much to be done in the way of adaptation to the requirements of the local market. Since the enforcement of the pure-food laws in the United States, which prevents the American manufacturer from placing on the market cheap and sometimes questionable tinned and bottled provisions, thus forcing him to confine his efforts to the sale of higher-priced stuff, adequate packing becomes more essential, as the breaking of a single bottle or tin in a consignment may mean the loss of all or most of the importer's profits, whereas with the low-priced goods slight damage was not so material.

As an example of the thoroughness with which the British study this market, the procedure of two of their largest provision firms may be cited. These firms send out representatives from home twice a year, who visit the local commission dealers for orders and also the various retail merchants, with the special object of ascertaining the condition in which their goods reach the consumer and to hear complaints. In this way the packers are able to discover many defects that the commission dealer, owing to the number of lines carried and his consequently divided interests, is not likely to report to the manufacturer even when he has been informed of them.

American packing cases are generally too thin and inadequately strapped. Tinned goods are commonly placed in the cases with no

paper wrappers to protect the labels and no sawdust to prevent the jostling of tins and the denting and leakage that frequently result. British provisions in bottles are inclosed in individual straw or corrugated cardboard jackets and intervening spaces are filled with sawdust, while similar American goods frequently arrive in sawdust with only a thin paper wrapper about each bottle, the result being that during the many handlings at various angles the sawdust shifts and many bottles are broken.

To keep labels always fresh and attractive, every precaution should be taken to attach them in such manner as to prevent discoloration by rust. During the wet season the labels on many tins are spoiled in this way and even during the dry months the points where glue or mucilage comes in contact with the tin become similarly disfigured. This can be prevented only by giving each tin a thin coating of paint or shellac before the label is attached.

#### Use of Air-Tight Boxes—Cereals.

Another precaution rendered necessary by dampness is that of having all tins for biscuits and cereals absolutely air tight. A certain type of supposedly air-tight box used by a well-known biscuit company, as well as other American exporters, has a round hole in the top into which a lid is forced and held in place by a strip of tin soldered across the top of the box. This no doubt proves very effective in the United States, but is inadequate here, and deterioration of contents results.

Another ineffective method of making boxes air tight is to place under the outer cover of the box a sheet of metal tissue, which, during the many handlings, is punctured by the contents being thrown against it. The only way to insure total exclusion of air is to solder the tin. One British company uses a tin that is very effective in this climate. Under its outer cover, which is easily removed, a thin sheet of tin is soldered, which covers about five-sixths of the top surface. The end of this sheet extends in the shape of a triangle over the remainder of the surface, which is of tin soldered firmly to the edges and does not come off. At the apex of the triangle is a flat ring. This top is perfectly air tight and is easily removed by inserting a hook or other convenient article (even a finger will suffice) into the hole and pulling steadily. The edges under this inner cover are beveled so that when it is removed there are no sharp edges to endanger the hands. Another company uses a box with a soldered-on top which is opened by means of a small V-shaped cutter supplied with each package. This gives satisfaction.

The packing of American cereals is usually inadequate to stand rough handling or afford protection against the deterioration that is the lot of cereals in this climate. One popular American breakfast food arrives in 2-pound cardboard boxes packed 36 to the case. This case has a  $\frac{1}{8}$ -inch top and bottom,  $\frac{1}{2}$ -inch sides, and  $\frac{3}{4}$ -inch ends, with an iron strap around each end. There is usually a considerable loss from breakage, because of the thin boards used, and spoiling results from the inadequate protection from climatic conditions afforded by the paper boxes.

Another American cereal comes in 2-pound tins, packed 36 to the case, which has  $\frac{1}{2}$ -inch sides,  $\frac{3}{4}$ -inch ends, and  $\frac{1}{8}$ -inch top and bottom, and usually arrives in fair condition. The defects in this package are

the want of paper around the tins, lack of iron bands on the cases, and containers that are not really air tight.

Another cereal is put on the market in 2-pound absolutely air-tight tins, 48 to the case, each wrapped in paper, and all packed in sawdust. The sides and ends of the box are of  $\frac{3}{4}$ -inch material, the top and bottom of  $\frac{1}{2}$ -inch, and the ends are iron strapped and strongly nailed. Cereals packed in this way arrive in excellent condition, cases unbroken, with no leaking or dented tins and no labels spoiled.

#### **Tinned Cream and Milk.**

The market for tinned milk and cream in China is steadily growing, and if American exporters take the trouble to observe the demands as to packing and labeling they should continue to enjoy no small share of it. At present several American brands are well known. The manufacturers of one have, so far, apparently used the same packing for China as for shipments in America. Their cases are a little too light, having  $\frac{3}{8}$ -inch sides,  $\frac{1}{2}$ -inch ends, and  $\frac{3}{4}$ -inch top and bottom, with only a single wire belt around the middle of the box instead of iron bands at the ends. Each case contains forty-eight 1-pound tins packed without wrappings, or filling of any kind, and without any precaution to protect labels. The result of such packing is shown by the following letter, which was received by the Shanghai agents from a dealer in a southern port:

We have opened one tin and the cream is in good condition, but we are afraid that the label will not do for our market. We do not refer to the design, which is quite good, but to the effect of the gum used in fastening the label. We inclose samples, which are fair representatives of how the tins look. On examining the tins we find that where the gum has come in contact with the tin, the tin has corroded. The effect of this gives the tin a very secondhand appearance and which might lead one to believe that the same was old stock. This is what our dealers and also purchasers would think. Furthermore, many of the tins have arrived in an unsatisfactory condition, a large proportion having dents in the same, and the labels on most of them being torn. We consider that it would be unwise to put such samples on our market. The cream is good, so far as we can judge, but the appearance of the tins is far from satisfactory and in our opinion would condemn the "chop" on our market.

Another brand, while arriving in cases that are too light, has the advantage of strong iron straps at each end, which serve to strengthen the box and minimize loss by theft. Each tin is carefully covered with a wrapper on which the name of the brand and specially adapted directions are printed in Chinese. Thus the good appearance of the tins is preserved and the Chinese legend serves to introduce and identify the brand to the native.

#### **Biscuits—Tinned Fruit and Vegetables.**

One well-known American biscuit company sends its biscuits here in 5-pound tins, the ineffective tops of which have already been commented on. Two dozen such boxes are packed in a wooden case with  $\frac{5}{8}$ -inch sides,  $\frac{1}{2}$ -inch top and bottom, and  $\frac{3}{4}$ -inch ends. Each end is reenforced with four  $2\frac{1}{2}$ -inch strips and iron strapped. These biscuits frequently arrive in bad condition owing to the breaking of the thin sides. Moreover, the tins are not perfectly air tight, and dampness enters and ruins the biscuits themselves. A corresponding grade from Great Britain comes in 2-pound tins with soldered inner covers, which makes them really air tight. Fifty of these are packed in a case sufficiently strong to guarantee the safe arrival of its contents, its sides, top, and bottom being of  $\frac{3}{4}$ -inch thickness and its

ends  $\frac{1}{2}$ -inch. Each of its six surfaces is reenforced with two lateral wooden strips,  $2\frac{1}{2}$  by  $\frac{1}{2}$  inch, and both ends are strongly strapped with iron.

Other American biscuit manufacturers show similar defects in their packing to those mentioned; all should give attention to securing tins that will really protect against climatic conditions.

American tinned fruits and vegetables for China usually come in cases of two dozen 2-pound tins, innocent of paper wrappings. The average case has  $\frac{1}{2}$ -inch sides,  $\frac{1}{2}$ -inch ends, and  $\frac{1}{2}$ -inch top and bottom, and is iron strapped at the ends. British goods have strong paper wrappers around all tins, which are frequently packed in sawdust, and the case is built  $\frac{1}{2}$ -inch sides,  $\frac{3}{4}$ -inch ends, and  $\frac{1}{2}$ -inch top and bottom, with ends strongly iron strapped. This extra precaution is well worth while, for American tinned fruits frequently reach here with cases broken, tins dented, and labels spoiled.

#### Confectionery and Fresh Fruit.

The unsuitable packing of American candies has largely excluded them from this market. American confectionery comes in fancy cardboard boxes, a considerable part of which are filled with paper shavings or excelsior, which in paper containers does not protect the contents to a great extent, but needlessly increases the space occupied and hence the freight charges. They are never packed air tight and consequently soon lose their freshness. A European firm that enjoys practically a monopoly in the sale of standard-grade chocolates here packs its products in round tin boxes of various weights, the tops of which are constructed in such manner as to render them nearly air tight, and each piece of candy is wrapped in tin foil. This method would be very hard to improve on. Other varieties of standard candies are sometimes placed in air-tight glass jars or bottles and keep splendidly.

Fresh fruit is usually inadequately prepared. The sides of the crates are far too light and the fruit is not packed to prevent contact and consequent rotting. Some shippers, as a special concession, put an extra thickness on the side, but as even then the sides are only  $\frac{1}{2}$  inch each in thickness, they are not strong enough. To guarantee the arrival of fresh fruit in good condition each piece should be wrapped in paper and the cases should have at least  $\frac{1}{2}$ -inch sides, tops, and bottoms, and  $\frac{3}{4}$ -inch ends. In addition there should be a division board across the center of the box of  $\frac{3}{4}$ -inch material, which would tend to prevent crushing from outside forces. Under the present system it is a common sight to see the thin boards of these frail boxes broken in or pressed down upon the fruit greatly to its damage.

---

#### METAL GOODS FOR SOUTH AMERICA.

(From Consul General Robert P. Skinner Hamburg.)

The report that in spite of care in packing metal goods and structural steel work for the South American markets the packages are broken and the contents injured very frequently is confirmed in the experience of German as well as American shippers. No golden rule has been discovered in this country for overcoming the rough handling to which freight is subjected in South American ports,

although better results have been obtained than formerly by making smaller packages than those commonly forwarded.

#### **Views of Shipping Line.**

I have been favored with the following communication from the South American service of the Hamburg-American Line on this matter, the writer being familiar with every phase of the packing and delivery question:

If shippers wish to minimize the breakage of their cargo they must give particular attention to the packing, and take care that the cases are strong enough and bundles securely fastened. Of course the strength of the boxes must depend upon the size and weight of the articles to be packed and the distance they must travel, and this can best be decided by the manufacturers themselves, it not being easy for the steamship companies to set any standard as regards this.

Our experience with structural iron and rough iron shipped in bundles has not been satisfactory, and in many instances where the iron is bundled the bundles break apart on being handled. Here again it rests with the manufacturers to secure the bundles tightly in proportion to their length or weight, but our general impression is that the manufacturers pay very meager attention to this, perhaps because the objects are not of such value as boxed goods. The steamship companies running between the Continent and the River Plate demand from shippers that bar and round iron up to 7 meters in length and of less than 12 kilos in weight must be delivered in bundles of 50 to 60 kilos, while bar and round iron over 7 meters in length and less than 12 kilos in weight must be delivered in bundles of 80 to 100 kilos.

We are only able to emphasize that manufacturers can not supply too strong a packing, and if they could only be made to realize this they would at the same time bestow a great benefit upon the steamship companies, the latter being the first to suffer when a breakage occurs, claims at once being sent in to them by shippers.

#### **German Packing of Metal Goods.**

The general German rule in respect to metal goods for South America is to make up a bundle as small as the nature of the shipment will permit. Loose pieces of iron are sent singly instead of being bound together in bundles, unless it is pretty certain that the bindings can not come apart or slip. Pieces of structural iron or steel in straight or symmetrical shape are very likely to slip from their bindings; on the other hand, bundles can be made when the pieces are of irregular shape and provide notches or convenient holes for the wire. Large single pieces frequently have the ends boxed or wrapped with straw. The ends of pillars, girders, round iron, and T and U iron are painted to facilitate identification. Bedplates, circular rivet plates, and rectangular connecting pieces with holes are packed in cases. Shipments of cotton ties to Mexico are made in bundles, the ties being folded into three equal lengths and the bundles attached with three strands of wire.

Certain fairly absolute rules have been adopted with respect to bolts, rivets, and small metal goods. To Brazil goods of this kind are forwarded chiefly in kegs or occasionally also in cases which, packed, have a weight of 50 or 50.8 kilos (110 or 112 pounds); to Argentina, Chile, and other South American countries, in packages of not more than 46 kilos (101.4 pounds); to China, in cases which have a weight of 1 picul (133½ pounds); to other countries, in barrels up to 300 kilos (not recommended), double bags of 50 to 60 kilos (110 to 132 pounds), and cases of 60 to 100 kilos (132 to 220 pounds). It is not advised that shipment be made to any foreign country whatever in packages weighing in excess of 50.8 kilos.

While undoubtedly the conditions governing the handling of cargo in South American ports leave much to be desired, and while shippers

in their own interests should provide packages best adapted to meet such conditions, there is the reciprocal obligation resting upon the transporter, imposed upon him by the act of February 13, 1893, commonly known as the Harter Act, whereby he can not relieve himself from liability "for loss or damage arising from negligence, fault, or failure in proper loading, stowage, custody, care, or proper delivery of any and all lawful merchandise or property" committed to his charge.

---

#### HONDURAS.

[From Consul Arminius T. Haeberle Tegucigalpa.]

Owing to the unsatisfactory transportation facilities and the rough handling goods receive, the merchants of Honduras are naturally anxious to have merchandise shipped to this country packed with the greatest care. An instance of excellent packing according to instructions has been called to the attention of this consulate, and it illustrates what can be done if importers' instructions are followed. Sixty-six packages of small statuary were so packed as to arrive in perfect condition, not a single piece being broken. Each piece was separately tied and wrapped in tissue paper and soft excelsior. The box, which was well made, was lined with soft excelsior. Extra charges were made for this, but the importer was glad to pay the amount in consideration of the excellent results.

The same merchant ordered 24 plates of glass, which were not packed according to instruction. The entire lot was smashed and was thrown overboard in Amapala. It is said that corrugated paper is superior to any other kind of wrapper for glassware. Small vases or flasks should be placed in tight-fitting boxes of this material stuffed with soft excelsior, or, if glass plates are shipped, two layers of corrugated paper should be placed between each plate in an excelsior-cushioned box. It has been found that even very hard jolts will not injure glassware thus packed.

Four transshipments and several weeks of jolting on the ox cart before the goods reach the capital necessitate extreme measures of careful packing when goods are sent to the interior of Honduras.

An example of inadequate packing has been called to this consulate's attention in connection with a shipment of porcelain shades, white enamel shades, and porcelain cut-off switches. The tin shades were more carefully packed than the porcelain, and almost all of the latter were damaged. They were still in the original boxes, so that the nature of the packing could be ascertained. The tin shades had cardboard caps to protect the tops, while the porcelain shades were not protected at all. The porcelain switches were packed only in cardboard boxes. Sixty-four boxes were in good condition, 30 damaged, while 6 switches were completely destroyed.

---

#### SALVADOR.

[From Consul General Thomas Ewing Dabney San Salvador.]

The experience of four large firms of San Salvador in connection with shipments of hats from an American exporting house reveals some of the obstacles to the development of American trade in this country. The hats received are practically unsalable here, first,

because of the condition in which they arrived, due to inadequate packing; second, because their colors are not adapted to the local taste.

These hats were shipped by parcel post in corrugated pasteboard boxes of the maximum dimension permitted by law. The containers, although demonstrated capable of sustaining a weight of 150 pounds, were not strong enough to afford protection to their contents. American parcel-post packages are treated exactly like newspaper packages, a fact that can not be brought home too often to American shippers. Placed in the usual unprotecting bag, they are dropped into the ship's hold, with other packages and boxes thrown on top. They are furthermore subjected to severe handling at the points of transshipment and during the mule-back trip if they go via Puerto Barrios. To avoid the mule-back journey, they should always be sent via Panama. Most of the packages examined were broken and crumpled flat, with resultant damage to the contents.

One of the firms about the same time received a shipment of hats from Italy, which suffered no damage whatever. The containers for these were made of a tough and hard felt composition at about the same cost as the corrugated boxes used for the American hats.

#### Disregard of Importers' Instructions.

With regard to the colors, each shipment from the United States consisted of black, coffee, and two shades of a dingy chestnut. Against the blacks and coffees there is no complaint, but the chestnuts are absolutely unsalable. What suits the taste of the United States does not suit the taste here. The traveling salesman who took the orders received ample and explicit instructions on this point, which, it appears, the exporter ignored, sending the colors he thought the Latin American trade ought to want. The exporters in the United States need to grasp thoroughly the fact that the Latin American knows what he wants and will be satisfied with nothing less. The Italian hats mentioned run 10 live colors to the dozen. It is no wonder that in spite of the proximity of the United States Salvador buys most of its hats from Italy, the imports therefrom in 1910 being valued at \$17,081, as compared with \$909 from the United States. Imports from the United States in 1908 were valued at \$2,120 and dropped to \$1,256 in 1909.

A further illustration of disregard of the importers' wishes was furnished when one firm's instructions to ship the hats by freight in a \$2 trunk were ignored. They were sent instead by post in pasteboard boxes, for which a charge was made and on which the transportation charges were practically the same as the freight would have been. Had the goods been shipped as directed, they would have arrived in perfect condition and the trunk could have been sold at a profit.

---

#### EGYPT.

[From Consul David R. Birch, Alexandria.]

The principal fault found with the packing of American goods imported into Egypt is that the cases are not secured with iron bands. A visit to the general merchandise storehouses of the customhouse on the quays at Alexandria, where thousands of cases containing every kind of goods from every country are stored pend-

ing clearance, showed that in almost every instance damage had resulted to American articles because of the absence of iron bands around each end of the case. Similar merchandise from countries in Europe was found to have arrived in good condition, but every case of goods from Europe was fastened with the iron strips.

In a store set apart by the customs administration for damaged goods were found five cases containing soap from a well-known Philadelphia factory. Each of the five had been broken and had almost reached the stage of falling apart when taken from the importing steamer. These boxes contained 82 pounds of soap each and were made of wood one-fourth inch thick, the same as would be used for the local trade in and near the factory. Despite the extreme thinness of the cases, they would probably have arrived in good condition if iron bands had been placed at each end. That the addition of such bands serves as an insurance against damage would seem to be proven by the arrival free from damage of about 100 cases of a well-known cereal from Chicago. These were no thicker than those used for the soap, but a thin iron band nailed to each end of the cereal cases brought the goods to Egypt without damage to a single box.

#### **Starch, Pianos, Furniture, and Typewriters.**

In a consignment of several hundred cases of starch from Chicago thin wood was used for the cases and no iron-band supports. Perhaps one-fifth of the boxes were broken, entailing a loss of a portion of the starch from each broken box; in some instances almost the entire contents were gone. The floor of the storehouse was covered with starch. These boxes contained 44 pounds each and were packed in  $\frac{1}{4}$ -inch cases.

Two American pianos, destined for Luxor, were well packed, with the exception of not having iron supports. One of the cases was broken and possibly the instrument damaged to a slight extent, but this was evidently due to rough handling en route.

Office furniture is one of the most profitable American articles imported into Egypt, but a firm having showrooms in Cairo and another with a store in Alexandria complain about the packing. They state that rarely does a shipment of furniture arrive without some portion of it being damaged because of the insecurity with which the articles are fastened inside the cases.

Importers of American typewriters say that no matter how rough the handling or how frequent the transshipment these machines always arrive in perfect condition. Considering the delicacy of the mechanism this statement may be regarded as a tribute to the method employed by typewriter houses, and an indication of what American packers can do when proper care is taken and the requisite interest shown in this very important element in retaining and expanding foreign sales.

There is no direct line of steamers from the United States to Egypt, and transshipment must be made in Italy, England, Greece, or Germany, thus entailing an extra strain upon packing cases. Instead of being more weakly packed, the goods coming from the United States to Egypt should be cased more strongly than those from European countries in order to withstand the necessary transshipment and extra handling.

## CANADA.

[From Consul Felix S. S. Johnson, Kingston.]

Canadian regulations as to the packing and shipping of fruit are set down in the inspections and sales act, the more important provisions of which are here given, as they will probably be of interest to American dealers.

Every closed package (box or barrel) must be plainly and indelibly marked with the name and address of the packer, the name of the variety, and the grade. The word "fancy" or No. 1, No. 2, or No. 3 must be used to designate the different grades. "Fancy" grade must be perfect fruit, No. 1 grade 90 per cent free from all defects, and No. 2 grade 80 per cent free from defects causing material waste and containing no culls. The faced or shown surface must be the same grade of fruit as the rest of the package.

The minimum size of the apple barrel is 26½ inches between the heads inside measurement, a head diameter of 17 inches, and a middle diameter of 18½ inches. The apple box must be 10 inches in depth, 11 inches in width, and 20 inches in length, inside measurement. Fruit baskets are of four sizes, namely, 15 quarts or more, 11 quarts, 6 quarts, and 2½ quarts.

The act provides a severe penalty for the alteration, effacement, or obliteration of marks on any package that has undergone inspection.

## AUSTRIA-HUNGARY.

[From Vice Consul Orestes De Martini, Trieste.]

Investigation among the principal importers of American goods disclosed complaints as to the packing of lard, bacon, cotton, shoes, cotton goods, and agricultural machinery. Faulty addressing has occasionally caused inconvenience and loss in cases of transshipment. In regard to the character of packing required for various American goods I would make the following suggestions:

Barrels used for lard should have an extra hoop at each end. Bacon should be packed in cases of stiff wood strengthened by iron bands covering the joints. Cotton goods should be packed with a lining of tarpaulin to protect them from dampness and the outer covering should be secured by metal bands. The outer cases for shoes should be at least 1 inch thick, and the inner boxes should be stowed as compactly as possible to prevent the contents from getting loose on the voyage. The inadequate baling of American cotton has been dealt with in various reports and remedies suggested. In the packing of agricultural machinery stronger cases are needed adequately to protect the heavier parts. The use of internal cleats and iron bands is suggested.

All marks and numbers on packages must be plainly visible to prevent confusion and wrong delivery. Weight, tare, etc., if given in the language of the country, greatly facilitate customhouse formalities.

---

*Wireless telegraphy in Peru.*—Supplementing the report published August 21, 1911, Consul General W. Henry Robertson, of Callao, advises that direct wireless communication has been established between Lima and Iquitos (across the Andes Mountains) without the use of intermediate stations.

**COMMERCIAL CONDITIONS IN BADEN AND ALSACE-LORRAINE.****KEHL.**

[By Consul Mlle A. Jewett.]

The consular district of Kehl embraces the Provinces of Alsace-Lorraine and the larger part of the Grand Duchy of Baden, in southwest Germany, and is a region of great industrial and commercial importance. It includes the cities of Freiburg, Baden-Baden, Offenburg, Rastatt, Strassburg, Metz, Mulhausen, Colmar, and some 40 others.

The Grand Duchy of Baden has a population of 2,010,000 and an area of 5,823 square miles. The most important industries are agriculture and the manufacture of woolen and cotton goods, machinery, silk ribbons, paper, leather, tobacco, china, glassware, clocks, jewelry, and chemicals. Beet sugar is also made and the district is celebrated for musical boxes and mechanical organs.

Alsace-Lorraine has an area of 5,601 square miles and about 2,000,000 inhabitants. Its people are noted for their thrift and industry. It is rich in mineral resources and its industries are many, varied, and progressive. This Province is very favorably situated for commerce, being in contact with Prussia, France, and Switzerland. It has about 1,300 miles of railroads, and has also the advantage of the great river traffic on the Rhine all along its eastern border and some of the most important canals of Europe.

**Commercial Activity During Last Year.**

Although 1911 was not favorable for agriculture in this consular district, as bank rates increased and money was scarce, still the industries of this region kept up well and on the whole enjoyed a fair year. The year began rather brilliantly and, but for the withdrawal of foreign capital in the latter months, might have been one of unusual business activity. Some of the crops suffered considerably from lack of rain in the summer, which reduced the purchasing capacity of the agricultural population, but freight rates were lowered, exportation increased, and more goods were sold abroad than usual.

Most of the factories worked full strength throughout the year, many improvements and additions were made to existing factories, and new ones are planned to be built this year, notably a cement factory at Molsheim, which will employ about 400 men, and a great textile and spinning mill at Strassburg, with a capital of \$625,000. A great many factories are building homes for their employees, notably at Mulhausen and at Singen.

**Mining Industries Increase Their Production.**

Alsace-Lorraine produces about 30 per cent of the entire iron output of the German Empire. In 1911 there were 54 mines working and the total production of iron ore was 17,754,571 metric tons (metric ton=2,204.6 pounds), against 16,654,144 tons in 1910. About 52 per cent of the sales, which totaled 17,369,734 tons, went to the foundries of Alsace-Lorraine, 3 per cent to France, 2 per cent to Belgium, and the rest to other parts of Germany. The production of pig iron in Alsace-Lorraine was 2,360,245 tons, ingot iron 1,342,786 tons, wrought iron 22,336 tons, and cast-iron ware 85,815 tons.

The coal output in 1911 was increased, but considerable difficulty was experienced by the mines in getting a sufficient supply of cars

and other transit facilities during the earlier part of the year to move this coal to the markets. Later, when the crops had been moved, the local market was flooded and considerable coal was exported to France and other countries. The total coal production of Alsace-Lorraine in 1911 was 3,033,436 tons, 12 per cent more than in 1910. Of this amount, 221,456 tons were used at the mines and 2,811,980 tons were sold, of which 316,285 tons were exported to France and 185,377 tons to Switzerland. Coke to the amount of 90,275 tons was manufactured at one of the mines and 4,557 tons of coal tar, 1,175 tons of sulphate of ammonia, and 787 tons of benzol.

The development of the potash deposits of Alsace has been rapid, and the production for 1911 would have been much greater but for the limitations imposed by law. All of the known mines of kali in Alsace have, it is believed, been bought up by the syndicate. The output of 1911 was 102,644 tons, about three times the amount extracted in 1910.

Asphalt and petroleum are also produced in Lorraine to a considerable extent. The output for 1911 was 5,002 tons of asphalt and 43,748 tons of petroleum. It is reported that important new deposits of petroleum and of coal have been found recently in these regions.

There are eight salt works in Alsace-Lorraine. The production was 60,791 tons in 1911, 67,690 tons in 1910, and 63,484 tons in 1909. The value in 1910 was \$6.59 per ton. Table salt retails for 2 to 2½ cents for coarse and 2½ cents per pound for fine. Salt used for agricultural and industrial purposes enjoys exemption from local taxation.

#### General Agriculture—Unusual Wine Trade.

About 64 per cent of the area of Alsace-Lorraine and 56 per cent of Baden is devoted to agriculture. The chief crops are cereals, potatoes, hops, wine, and hay. The number of winter agricultural schools has increased from 7 to 13, and all are well attended. These schools seem to modernize and greatly improve the agricultural methods in this district, naturally resulting in the use of more agricultural machines.

The past year was the second successive bad year for the farmers; 1910 was too wet and 1911 was too dry. The long-continued drought of the summer seriously affected several important crops. In the Black Forest of Baden 17,800,000 young trees were killed by the drought, causing a loss of about \$150,000 and entailing an expenditure of another \$150,000 to replace the ruined trees.

The principal field crops of 1910 and 1911 in Alsace-Lorraine were as follows:

Crops.	1910	1911	Crops.	1910	1911
	<i>Metric tons.</i>	<i>Metric tons.</i>		<i>Metric tons.</i>	<i>Metric tons.</i>
Wheat.....	182,150	208,390	Potatoes.....	1719,262	1670,390
Rye.....	81,541	82,991	Clover.....	275,011	178,904
Barley.....	88,829	93,886	Lucerne.....	187,397	127,348
Oats.....	197,842	175,856	Meadow hay.....	1,141,296	808,681

<sup>1</sup> Half crops.

The wine crop of 1911 was a little below normal in Alsace-Lorraine, but was considerably larger than in 1910. The quality was fair, and prices of new wine were maintained at an average of about 42 cents

per gallon. The average yield of Alsace-Lorraine is about 22,000,000 gallons per annum, or one-fourth of the entire production of wine in the German Empire. The total value of the wine crop in Alsace-Lorraine for 1911 is estimated at \$8,330,000, a figure which has been equaled but once since 1875. Seventy-five thousand acres of land are devoted to wine culture in Alsace-Lorraine and 40,000 acres in the Grand Duchy of Baden. In Baden 1911 was an exceptionally good wine year. The total crop of this Province was about 8,900,000 gallons, against 1,162,000 gallons in 1910, and the value was about 10 times as much as in 1910.

#### **Tobacco, Hop, and Potato Crops.**

The tobacco crop of 1911 in this district was reported to be excellent, but no statistics of its amount are yet available. For the culture year ended June 30, 1911, the acreage was slightly increased in Alsace-Lorraine; and the crop was 8,410,500 pounds, against 7,039,500 pounds in the previous year. In Baden the crop was exceptionally good. The total tobacco acreage in 1910-11 was 42.6 per cent of the total German tobacco fields, and the crop was 23,894,100 pounds, or 47.6 per cent of the entire crop of Germany. Baden tobacco averages better and higher priced than the tobacco of other parts of the Empire.

The hops of this district are particularly fine in aroma and color and constitute an important crop in Alsace-Lorraine. Nine-tenths of the hops are grown in lower Alsace. The acreage was slightly less in 1911 than in 1910, 9,753 acres to 9,854 acres, and the crop was 7,032,200 pounds in 1911, against 11,132,940 pounds in 1910. In 1909 the crop was a failure, and in 1908 it was unusually large.

The potato crop in this region was only about half the average and great quantities were imported from abroad as well as from other Provinces of Germany to meet the demand. During a portion of the year the customs duty was removed from potatoes, owing to the scarcity, and some of the municipalities bought and sold potatoes at cost to the city employees and workmen and to the soup kitchens, and at a slightly higher rate to the public markets. In this way Strassburg sold 1,433,000 pounds of potatoes, expending the sum of \$14,850, which was nearly all covered by the receipts from sales.

#### **Textile and Other Manufacturing Industries.**

In Alsace-Lorraine about 140,000 persons are engaged in the textile industries, and in Baden about 40,000 persons. In 1909 Alsace-Lorraine had 1,638,000 spindles at work.

The cotton mills fared better than the woolen mills, but the year was not up to the average in either branch. The high and speculative price of raw cotton had a depressing effect on the cotton-goods industry. Production was cut down by the majority of the mills by working fewer days in the week, but no mills shut down entirely during the year. Owing to high prices and to the tight money market, sales were smaller than normal. The competition of Italian mills is being felt more and more by the German mills.

The woolen-goods mills report a bad year. Wool was high and advancing and at the same time the wholesale dealers in woolen goods refused to raise prices to keep up with the price of wool. The prevailing fashions in women's dresses cut down the demand for dress goods perceptibly. The woolen spinning mills did fairly well

in spite of unfavorable conditions. As a rule they have large capital and reserve funds that enable them to keep up their work and pay regular dividends out of the reserve funds when necessary. One large company with capital stock of 4,000,000 marks (\$952,000) and 4,000,000 marks reserve funds, having 95,000 spindles and employing 1,500 hands, increased its dividends from 6 per cent to 10 per cent. Most of the mills paid 4 to 6 per cent dividends.

The jute mills did a rather unsteady business owing to the fluctuating and advancing prices of the raw material. Prices were highest in May and June and lowest in July, ranging from \$6.45 to \$4.66 per hundredweight (112 pounds) for raw jute and \$6.66 to \$5.71 per hundredweight for manufactured jute.

Wages of mill hands in general advanced somewhat in 1911, but not in proportion to the increase in the cost of living to the workmen.

Pottery, glassware, and chemical products factories had a fairly prosperous year, while conditions in the shoe and canning factories and tanneries were unsatisfactory.

#### **Rhine River Commerce.**

The total Rhine traffic in 1911 at Strassburg harbor was 1,089,000 tons, a decrease of 114,000 tons from the total of 1910. The water was lower than in 1910 and traffic was stopped during 37 days, giving only 328 days for navigation. Traffic on the upper Rhine from Strassburg to Basel was considerably reduced by the low water during the latter part of the summer. The decrease in the Rhine traffic was chiefly in coal and coke and this was due as much to the bad condition of the coal market as to the low water. The shipments of coal and coke to Strassburg were 107,000 tons less in 1911 than in 1910. Petroleum and crude oil were 5,200 tons less and piece goods 8,700 tons less. On the other hand, cereals show a total of 20,300 tons more than in 1910. At the Kehl Rhine harbor, 820 vessels entered in 1911, discharging 212,160 tons.

The canal traffic at Strassburg was 2,000 tons greater in 1911 than in 1910, although navigation on the canals was interrupted for some six weeks during 1911.

#### **Markets for American Goods.**

As most of the American goods used in this district come indirectly from other cities, it is impossible to ascertain their amount, but American goods of all sorts may be sold here if they correspond to the needs and tastes of the people. There is plenty of money here, and the country can buy what it wants. But American goods must present distinct advantages of price, quality, or style to compete with goods of local manufacture. There is a strong sentiment here in favor of patronizing home industries, which is fostered by commercial associations and the public press. Local manufacturers seem to fear foreign competition and are loth to give foreigners any information in regard to their business, even when doing so could not work any harm.

To be sold here, goods must first be seen by the purchasers. Catalogues will not create new business. In the last three years not a single local buyer has taken advantage of the collection of American catalogues displayed at this consulate.

American sewing machines seem to almost monopolize this market. It is claimed that one American company, through its German-American branch, sells as many sewing machines in this district as all other foreign and German companies combined. The reasons for this seem to be thorough organization, competent exclusive local representation, extensive advertising, liberal terms on the installment plan, and the system of carrying complete stocks of all varieties of machines and of all repair parts and keeping expert repairers and demonstrators at accessible places.

American-made shoes are selling here, but not to a large extent, as they entered this market only after German-made American-style shoes had developed into a well-made and popular imitation. Their sale may also have been hindered by the fact that stores that handled them did not carry sufficiently large and varied stocks to meet all the demands. American shoes are carried in some department stores, together with local makes, but such stores do not push the American shoes enough to create an important business in them.

The United States buys large quantities of eyeglass lenses from this district and sells a considerable quantity of eyeglass frames, especially gold bows and frames, to opticians here.

#### **New Enterprises and General Progress.**

Progress is being made in almost all lines of enterprise and industry in this district. Iron and coal mining are developing. Large new iron and steel works are approaching completion in Lorraine, notably the foundry at Hagendingen, which will have an enormous capacity. New factories for the manufacture of paper, Portland cement, sugar, machinery, and glassware, cooperage works, spinning and weaving mills, electrical works, and many minor industries have been completed or are under way.

The mileage of railroads has been increased slightly and traffic has increased considerably. Street railways increased in Alsace-Lorraine from 84.5 miles in 1910 to 88.9 miles in March, 1911. The number of persons carried in 1910 was 34,548,670 and in 1911, 36,254,043. Improvements on canal and river navigation have been made and are still being pushed with considerable activity. In Strassburg, extensive and important work is being carried out in new street construction and other public works. Building operations were fairly active in 1911. The industrial and commercial prospects at the beginning of the year look promising for 1912.

#### **Exports to the United States.**

The exports to the United States and its insular possessions, as invoiced at this consulate, reached the record amount of \$3,915,268 in 1911. The heaviest increases over 1910 were noted in the items of thread, artificial silk, confectionery and chewing gum, machinery, and India paper. Dress goods, underwear, hair nets, clocks, skins, wall paper, pottery, and goose-liver pies fell off. Goose-liver pies are the celebrated specialty of Strassburg, where 250,000 geese are said to be fattened and killed annually, besides large imports of goose livers from Austria-Hungary. The Strassburg manufacturers complain that their business is seriously injured by the French *paté de foie gras*, which they claim is not pure goose liver.

The principal exports to the United States for 1910 and 1911, as declared at this consulate, are shown in the following table:

Articles.	1910	1911	Articles.	1910	1911
Automobiles (chassis and parts).....		\$36,422	Machinery.....	\$445,433	\$400,410
Books.....	\$82,063	99,362	Musical instruments and parts thereof.....	66,349	65,500
Buttons.....	13,895	23,710	Paper goods:		
Chemicals:			India paper.....	24,792	27,820
Barytes.....		5,355	Packing paper.....	28,333	24,405
Fertilizers.....	71,228	90,206	Paper boxes.....	4,649	3,942
Other.....	57,143	42,300	Papier-mâché.....	17,828	10,003
Church vestments and ornaments.....		8,444	Wall paper.....	60,242	51,352
Clocks and parts thereof.....	97,500	60,048	Other.....	51,434	18,027
Confectionery and chewing gum.....	33,551	147,987	Pottery and earthenware.....	22,727	8,046
Gelatin and glue.....	87,707	122,078	Spirits, wine, beer, etc.....	6,195	7,903
Glassware:			Steel:		
Eye and watch glasses.....	57,848	71,704	Bars.....	34,616	57,870
Hollow glassware.....	53,390	41,939	Steel wool.....	11,420	9,047
Other.....	70,564	84,780	Tool steel, not manufactured.....	22,204	40,118
Goose-liver pies.....	34,318	32,177	Textiles:		
Hair nets.....	95,180	64,907	Dress goods.....	510,530	306,354
Hides and skins:			Hatters' plushes.....	35,994	42,420
Calskins.....	10,812	34,419	Artificial silk.....	77,721	173,323
Cow and ox hides.....	6,004	1,206	Thread.....	427,408	909,877
Hare and rabbit skins.....	402,327	323,555	Underwear.....	22,305	8,685
Other.....	51,230	14,424	Other.....	62,248	73,634
Hops.....	26,596	33,578	All other articles.....	155,699	119,477
Horsehair (imitation).....	14,078	14,380			
Leather goods.....	35,196	25,319	Total.....	3,361,804	3,871,187

The exports to the Philippines in 1911 consisted of clocks, \$710; underwear, \$10,254; and other articles, \$12,457; making a total of \$23,421, against \$38,880 in 1910. Clocks to the value of \$129, against \$811 in 1910, comprised the total exports to Hawaii, and motor trolley automobiles to the value of \$3,647 were the only shipments to Porto Rico in 1911. The exports to Porto Rico in 1910 consisted of \$113 worth of thread.

### MANNHEIM.

[From Consul Samuel H. Shank.]

The industrial situation in the Mannheim district during 1911 was better than had been anticipated and showed a marked improvement over the preceding year. In spite of local and foreign disturbances, drought, and increase in the cost of living, business in almost all branches showed a favorable development.

In spite of the political disturbances, the money market was satisfactory. The rate of interest was reduced from 5 per cent at the beginning of the year to  $4\frac{1}{2}$  per cent on February 6 and to 4 per cent on February 18, at which it remained until the demand for moving the crops necessitated a rise to 5 per cent on September 19, where it remained during the rest of the year. The total exchange at the Mannheim branch of the Imperial Bank amounted to \$1,619,149,500. All of the private banks report good business and one of the largest declared a dividend of  $8\frac{1}{2}$  per cent.

### General Crop Returns—Exceptional Grape Harvest.

It was thought that the extreme heat had almost ruined the hop crop, but rains came in time to save it. While not up to the average in quantity, the crop proved to be greater than was anticipated and was of most excellent quality. The total amount of the German hop crop was 23,870,000 pounds, as compared with 44,000,000 pounds in

1910. In consequence of the fear that the crop would be a total loss and the fact that the hot weather increased the consumption of beer, the price of hops rose to \$95.20 per 110 pounds, the highest since 1882.

The tobacco crop was only about three-fifths of an average. The excessive heat spoiled the quality to such an extent that little was available for cigar making. Most of the tobacco in this district is used for making smoking and chewing tobacco and snuff. The prices were \$5.95 to \$8.30 per 110 pounds.

The grape harvest was the fourth largest in 40 years and, on account of its excellent quality, the prices received have not been equaled in that time. The value of the total crop in Baden in 1910 was \$595,000 while the 1911 crop is estimated at \$5,117,000. The fruit was so rich in sugar that no addition of sugar was allowed by the authorities and the wine of 1911 will probably remain a standard for many years.

The potato crop was a medium one, but larger than that of the previous year and of fine quality. On account of the small crop of 1910 the prices were much higher than in recent years.

The grain crops were all good. Wheat and rye showed a slight increase in production, while oats and barley showed a small decrease.

#### **Manufacturing Interests Active.**

A general increase in output is shown in all lines of manufacture, but the increased cost of production prevented an increase in earnings. Reports from 186 manufacturers show an increase in production, while 61 report a decrease. Cost of production in two-thirds of the cases reported has increased and in no case has it been reduced.

The chemical factories which manufacture substances used in making powder and explosives were directly benefited by the war between Italy and Turkey and political disturbances in various parts of the world. In pharmaceutical factories the production was as large as in 1910, but competition from foreign factories made the export business more difficult. The fertilizer manufacturers report a successful year due to the increased demand, especially from abroad. The color manufacturers shared in the general prosperity and, as in the past, were able to declare good dividends.

Exceptions to the generally favorable reports are those from the textile and glove-leather industries. The textile manufacturers suffered from exceptional prices of raw material until late in the year, and in consequence of the high cost of manufacture were unable to show much profit. The large crop of cotton brought a reduction in price, but too late to materially offset the bad conditions existing up to that time. The glove-leather industry suffered from the fact that styles changed to knit gloves and there was no demand for leather.

Jewelry, leather, steel, machine, and other industries report a general increase of business but little or no increase in earnings, owing to increased cost of production.

#### **Transportation—Labor Conditions—Food Prices.**

The transportation movement by water was not so large as in 1910, as there was not so much water in the Rhine as in the previous year. However, the decrease was immaterial and was partly due to a strike of the dock hands. The railroads show an increase in both the number of persons carried and the amount of freight hauled.

Labor conditions were fair during 1911. The number of laborers in the Mannheim district increased about 3 per cent over 1910. Only 6 firms report a decrease in the number of workmen employed, while 100 report increases. Some manufacturers complain that it is impossible to secure workmen who are sufficiently skilled even when high wages are offered. This is especially true of skilled mechanics in the machine factories. Of 294 factories reporting, 218 had increased the wages during the year. None reported a reduction in wages. In Baden there were 852 firms and 31,353 workmen involved in strikes and lockouts during the year.

Most articles of food show an increase over 1910 prices. The cost of meat of all kinds, eggs, milk, coffee, and vinegar increased, while flour, bread, peas, and buckwheat were a little cheaper. Wood and coal also show a little reduction.

#### Trade with the United States.

There is no great opportunity for extension of American trade here, as it is already well established in most lines. For example, one store in this city handling office supplies carries over 100 different American articles and a hardware store over 50. However, the purchasing power of the general public is constantly increasing, and careful introduction and energetic pushing for business should show satisfactory results.

The principal exports to the United States, as invoiced at this consulate during 1910 and 1911, are shown by the following table:

Articles.	1910	1911	Articles.	1910	1911
Automobiles.....	\$203,206	\$214,884	Grindstones, etc.....	\$5,280	\$1,074
Books and calendars.....	1,868	6,578	Hides and skins.....	281,678	271,982
Caramel.....	8,109	8,805	Hardware.....	2,706	17,919

Aniline.....	884,199	853,503	Waste.....	297,983	291,208
Indigo.....	746,085	760,202	Wine.....	62,842	77,946
Earthen and stone ware.....	1,326	12,885	Wood pulp.....	608,931	500,931
Filter pulp.....	16,516	34,987	All other articles.....	143,814	43,854
Garlic.....	12,384	9,276			
Gelatin.....	67,162	82,711	Total.....	6,501,747	6,669,393
Gluce.....	5,471	10,848			

The exports to Porto Rico amounted to \$7,090 in 1911, of which \$6,121 was jewelry. To the Philippines were sent goods to the value of \$9,486, the principal items being indigo, \$1,373; jewelry, \$2,372; machinery, \$2,377; and perfumery, \$2,371.

*Ghee*, or clarified butter, which largely enters into the food of the natives of India, has risen in price from 4 cents to 20 cents per pound in the past 20 years. Consul Stuart K. Lupton, of Karachi, adds that at the higher price it is said to contain two-thirds of coconut oil.

**CONSTRUCTION WORK ABROAD.****ARGENTINA.**

[From Consul General R. M. Bartleman, Buenos Aires.]

**Commission on Commemorative Monuments.**

An Executive decree has been issued creating a commission on commemorative monuments. This will be presided over by the intendente (mayor) of Buenos Aires, and the membership will be composed of the Director General of Architecture, the president of the American Historic and Numismatic Commission, the president of the National Academy of Fine Arts, and the director of the National Museum of Fine Arts.

Said commission is to revise the general plan of the public monuments now under construction or to be constructed later. It is to suggest to the Minister of Public Works improvements in the beautification of surroundings and general harmonization of the public commemorative monuments.

It is made the duty of the Director General of Architecture of Argentina to cooperate with this commission and to place at its disposal all plans, schemes, data, etc., available.

**Proposed Marine Esplanade.**

An interesting scheme has been advanced for constructing a big avenue 3 miles long and 165 feet wide on land reclaimed from the River Plate by erecting a wall 13 feet thick. This avenue would have a pavement 36 feet wide on either side and a double-track tramway service in the center. Among the conveniences mentioned are underground stations containing a salon for first aid, a police station, lavatories, a pier with bathing places, social-club building, casino, theater, amusement places, etc. The proposer of the scheme is Senor Julio Thibaut, the proprietor of the Eden Hotel, Olivos, near Buenos Aires, whom the newspapers report as having at his disposal the necessary capital to carry out the work.

---

**BRAZIL.**

[From Chargé d'Affaires George Barclay Rives, American Embassy, Petropolis.]

**Construction Payment on Battleship.**

The Brazilian Government has authorized the payment of an installment of \$1,300,000 to the English firm of Armstrong, Whitworth & Co. (Ltd.) on account of the construction of the battleship *Rio de Janeiro*.

---

**URUGUAY.**

[From American Minister N. A. Grevstad, Montevideo.]

**New Bids for Large Bridge.**

All seven of the bids for constructing a bridge across the Santa Lucia River at its mouth, in the Department of Montevideo, have been rejected as defective in one way or another. Most of the bidders were German firms. No American firm had submitted bids.

The Department of Public Works has requested the Bureau for Roads and Bridges to prepare a new call for tenders in two parts, one comprising the substructure and the rubble work and the other the metallic or superstructure. It is estimated that the amount

involved in this contract approximates 1,500,000 pesos (\$1,551,000). It was a disappointment to Americans here that the American bridge firms did not take part in the competition for this important work. Possibly the competition may be more attractive now that bids may be submitted separately for the stonework and the metallic superstructure.

[A notice of the call for tenders for this bridge was published as Foreign Trade Opportunity No. 7203 in Daily Consular and Trade Reports for August 21, 1911. The blue prints and specifications which were referred to in that notice are still on file in the Bureau of Manufactures.]

---

#### VENEZUELA.

[From Consul Thomas W. Voettler, La Guaira.]

##### Concession for Two Traction Lines.

The Venezuelan Minister of Fomento has signed a contract with Carraciolo Parra Picon by which the latter is to construct two traction lines. One is to start from a point near Merida or Mucuchies and is to join another from Tovar or Bailadores. The terminus of each line will be the station of El Vigia on the railroad from Santa Barbara to El Vigia, or a dock on the Rio Chama, which the concessionaire will construct in case the river be used instead of the railroad for communications with Maracaibo Lake. The concessionaire is to purchase the railroad mentioned from the Government and to change the course of the Chama at El Vigia. He may use electricity or steam to operate the line and transport freight or passengers therewith. The address of the concessionaire is Carraciolo Parra Picon, Salas a Caja de Agua, No. 59, Caracas.

---

#### DOMINICAN REPUBLIC.

[From Vice Consul General Frank Bohr, Santo Domingo.]

##### Surveys and Plans for Public Works.

In addition to the construction work plans for this Republic, as noted in Daily Consular and Trade Reports for January 8, March 1, and April 20, 1912, the following may be noted:

(1) Construction of a railway from this city to connect with the lines in the north of the Republic. Approximate length, 80 miles. Surveys already completed by the Department of Public Works (Obras Publicas) of the Dominican Government. Correspondence should be with John L. Mann, Director General of Public Works, Santo Domingo, Dominican Republic.

(2) Proposed construction of a waterworks for the city of Santo Domingo. Surveys and plans at present being made by the municipal engineer. Correspondence should be with the President of the Honorable Ayuntamiento, Santo Domingo, Dominican Republic.

(3) Construction of a drainage system and raising the land level of the city of Macoris. Surveys and plans already completed. Correspondence should be with the President of the Honorable Ayuntamiento, Macoris, Dominican Republic.

## ENGLAND.

[From Vice Consul James Fisher, Hull.]

**The New Dock at Immingham.**

The new deep-water dock at Immingham, which was unofficially opened for traffic on May 15, is a notable engineering achievement. On what five years ago was dreary marshland, what is possibly the deepest dock in England has been constructed. Its depth ranges from 30 to 35 feet in the dock basin, and the total water space, exclusive of locks, amounts to about 45 acres, the full length of quayage being 4,500 feet, while there is a large area of land available for extension. The entrance lock has a length of 840 feet, a breadth of 90 feet, and a depth ranging from 27½ feet low-water spring tides to 47 feet high water. About 3,500,000 cubic yards of earth have been excavated and used in raising the land around 5 feet above its original level. Two long jetties extend out on either side of the entrance, curving around midway in order to run parallel to the river. One jetty is intended as a landing place for passengers, and the other is being used for the shipment of bunker and cargo coal. From the main dock extends a large graving dock. Several powerful cranes are provided on the dock side, and the coal-handling plant is comprehensive. There are eight coal hoists, each served by a set of full railway sidings, and each capable of dealing with about 700 tons of coal per hour. Siding accommodation is provided for over 11,600 cars, carrying, in all, 115,000 to 174,000 tons of coal. For the grain trade a large granary has been erected at the east end of the dock, while the northwestern arm of the dock forms a large timber pond, and a light railway and an electric railway system link Immingham with Grimsby, and it is hoped in time to carry the tramway right round the dock estate. The dock being close to an important industrial and coal area, the proprietors (the Great Central Railway Co.) are most hopeful as to its future.

---

**AN AMERICAN'S WORK IN URUGUAY.**

[From American Minister Nicolay A. Grevstad, Montevideo.]

Dr. Daniel E. Salmon, who, during the last five years has been director of the State Veterinary School of Uruguay, has resigned from this position and returned to the United States. His contract with the Uruguayan Government was for four years, but he consented to remain another year, as the work of construction and organization proceeding under his supervision had been delayed on account of circumstances not within his control.

Dr. Salmon's work in Uruguay is said to have been highly creditable to himself and eminently beneficial to the people of the country. Under his immediate direction one of the finest veterinary schools in the world has been built, equipped, and organized. He is said to have established a high standard of teaching and to have created a desire for original research. He returns to the United States to carry to conclusion important scientific investigations concerning the nature and cure of tuberculosis. His work in this country has earned for him the respect and gratitude of the Government, as it ranks among the most important in the field of American educational influences in Uruguay.

**COTTON CULTURE IN TURKESTAN.**

[From Consul General John H. Snodgrass, Moscow, Russia.]

The Russian press has been giving some attention to the subject of cotton culture in Turkestan, the climate of which, according to a recent newspaper article, is not favorable to the growth of ordinary varieties of this fiber, due to the short summer. The selection of a cotton plant giving a good crop and ripening early in the season is therefore of the greatest importance to Turkestan.

In 1903 American seed was purchased and sent to Turkestan. Part was cultivated at the Andreevsky plantation, part on private lands, and the success obtained was such that in 1908 several firms joined in purchasing 3,000 poods (pood = 36.112 pounds avoirdupois) of American seed. That year turned out to be a very bad one for cotton growing, owing to a rainy spring and early autumn, and the results from the American seeds were not especially satisfactory, so that only a few cultivators retained them. Two landowners who had received "Floridora" seeds obtained good crops and early ripening.

In 1910 and 1911 three early-ripening varieties were received in the Tashkent district—the Triumph, King, and Cook. The last-named was found unsatisfactory, but the other two gave good results, the Triumph seeds especially yielding a very good crop. On the Government plantation of "Kaplanbek" the American seeds yielded 93 poods per dessiatine (2.7 acres) under favorable conditions, and 70 poods in one instance where the first sowing had to be repeated, while the general crop was only 40 to 60 poods. According to the classifiers of the Moscow Exchange, the fiber of this cotton is very strong. [A previous report on Turkestan cotton appeared in Daily Consular and Trade Reports on Feb. 17, 1912.]

**More American Seed Ordered—Development Plans.**

An order for seeds of the Allen and Floridora sorts, as well as the New Columbia and New Egyptian, with long fiber, has been sent to the United States during the current year.

According to the Ruskoye Slovo, there are three plans for the development of the cotton culture in Turkestan under discussion. One is to extend the area of the cotton fields and include all the irrigated land. To extend the cultivation of cotton at the expense of maize, wheat, etc., would mean, it is said, a further rise in the price of the necessities of life, which has already become a serious question in Turkestan. Another plan contemplates the irrigation of waste land. This, it is said, would involve the expenditure of many million rubles, while the results would not be shown for 10 years or more. The third plan consists in the regulation of the water supply and the improvement of the legal and financial condition of the "dihkans," or small cultivators. [The irrigation of Turkestan with relation to cotton culture was reviewed to some extent by Consul General Snodgrass in Daily Consular and Trade Reports on April 25.]

The principal producers of cotton are said to be the owners of the small plantations. Most of them are said to be very poor and dependent upon the banks for capital to run their plantations, which is repaid with cotton at a high rate of interest. It is thought that no improvement or development in the cultivation of cotton is possible until the condition of the "dihkans" is improved.

**Results of Tour of Investigation.**

A later issue of the same newspaper contained the following interview with a member of the party which made a recent trip of investigation to Turkestan:

Turkestan promises full compensation not only for the sums of money spent to increase the productivity of the country but also for the much greater sums that will be required in future. The very favorable conditions of both soil and climate will make Turkestan the center of cotton production, and there is every reason to expect that Turkestan and Transcaucasia will yield such quantities of this fiber that the same will be exported and the \$60,000,000 paid yearly to America will remain henceforth in Russia.

The necessary measures have been ascertained, the program of work established, and steps have been taken toward the practical realization of the same. These are, first of all, the irrigation of new territories in the Ferghana and Samarkand districts, which is to be carried out by the Government as well as by private persons. Very favorable results have been obtained by the Government with the water of the River Syr-Daria. A group of Moscow merchants has offered to irrigate 250,000 to 500,000 acres in the Kara-Kum steppe.

The Agricultural Department will endeavor to introduce cultivation of cotton by machinery, which represents a great saving and will, consequently, tend to develop the business. Measures will be taken to secure the necessary number of workmen, the best method being the settling of immigrants.

---

**SOUTH AFRICAN NOTES.**

[From Consul E. A. Wakefield, Port Elizabeth, Cape Province.]

**Quick Handling of Freight.**

A record for South African ports in landing and shipping cargo was recently made at Algoa Bay during the week ended April 20. The English mail boat usually arrives early on Thursday morning of each week and departs about 6 p. m. the following day. The steamer did not arrive until mid-afternoon, and it was about 4 o'clock before a commencement was made at discharging cargo. Notwithstanding this, the harbor board department landed 2,417 tons of general cargo without delaying the steamer, and during Friday night 1,350 tons of this cargo was forwarded by rail to the Transvaal and Orange River Colony. As the Government line is only 3-feet gauge, with comparatively small freight cars, this record is creditable.

**Ostrich Feather Trade.**

By the mail steamer of April 20 the value of the shipments aggregated over \$75,000, composed principally of ostrich feathers. The ostrich-feather market is exceedingly good, with prices of better grades 10 to 15 per cent higher than at the beginning of the year. Sales for the week ended April 27 constituted a record for the Port Elizabeth market. The amount realized for 12,383 pounds was \$172,857, as compared with the previous best record of 11,306½ pounds, sold for \$165,607, during the week ended April 8, 1911. There is no indication of any immediate depression in the market, as all offerings are readily sold at good prices.

**Wool Prices.**

At the catalogue wool sales in the produce exchange 326 lots, comprising 3,420 bales, were offered, of which 903 bales were sold. Good light wools were in fair demand, but faulty lots, which comprised most of those unsold, were not desired. Prices of snow whites ranged from 29½ to 39½ cents and for greasy wools from 6 to 15 cents per pound. The market for mohair is very quiet, with more offerings than the demand requires.

**NOTES FROM ARGENTINA.**

[From Consul General R. M. Bartleman, Buenos Aires, values being stated in United States currency.]

**New Ships—Matches—Subway Opening.**

A newspaper dispatch from Vienna announces that the Austro-American Navigation Co. will devote \$5,075,000 to the construction of new vessels for its South American service.

It has been the local custom to furnish matches gratis with each purchase of cigarettes, but it has been decided by the retail tobacco and cigar dealers to abolish this practice.

The contractors of the tube tram line are about two months ahead of contract time, and it is believed the opening of the first section will take place at the beginning of August.

**Dairy Products—American Stamps—Crude Oil.**

During 1911 there were imported into Argentina 4,919,437 kilos [kilo = 2.2046 pounds] of cheese, 351,651 kilos of condensed milk, and 188,455 kilos of malted milk; and there were exported during the same year only 518 kilos of cheese.

Numerous manufacturers and individuals in the United States are sending to Argentina stamped addressed envelopes to be used in forwarding the replies to their letters. This is wasted expenditure, as American stamps can not be used in mailing letters in this Republic.

During 1911 there were imported into Argentina 61,223,261 kilos of crude petroleum, with an estimated value of \$5,909,009. The previous year the imports amounted to 39,478,583 kilos, valued at \$3,809,682.

**Wool Shipments—Women's Professional School.**

In the six months from October 1, 1911, to March 31, 1912, 238,445 bales of wool were exported from Argentina and 58,410 bales from Uruguay, of which 25,295 bales of the former and 3,462 bales of the latter were shipped to the United States. In the corresponding six months of 1910-11 total shipments from Argentina aggregated 303,159 bales, and from Uruguay 55,869 bales. [A review of the Uruguayan wool clip appeared in Daily Consular and Trade Reports on May 6, 1912.]

Recent executive decrees have dealt with the courses of study to be pursued in the Escuela Profesional de Artes y Oficios de Mujeres (Women's Professional Arts and Crafts School). Among the branches included in the curriculum are arithmetic, Spanish, Argentine history, natural history, domestic economy, housekeeping, care of the sick, first aid, care and education of children, etiquette, social duties, home account keeping, physical culture and gymnastics, sewing and dress-making, lace making, millinery, making of artificial fruits and flowers, telegraphy, painting and drawing, lettering and designing of carpets, illustrations, diplomas, etc., photography, glove making, embroidery, bookbinding, cooking, and laundry work. [A copy of the decree, in Spanish, will be loaned to those interested by the Bureau of Manufactures.]

**Coal Imports and Deposits.**

Coal imports during 1911 amounted to 3,717,026 tons, with an estimated value of \$25,108,508, as against 3,326,355 tons, value \$22,469,531, for the previous year.

One of the large coaling companies in Buenos Aires stated in April that its stock of this product was exhausted and that no more was expected until toward the end of that month, when Pennsylvania coal would arrive. Coal was then \$18 to \$20 gold a ton in Buenos Aires.

At Curilehu, near Chosmalal, at San Martin de los Andes, Covunco, and Picun Leufu, on the Neuquen, there is said to be coal in considerable quantities and superior to Cardiff coal. The question of transportation arises in connection with the development of these deposits. The new line of the Southern Railway will tap these fields. It will also tap the petroleum and tuff districts. Tuff, or tuffit, is a volcanic rock of great strength and durability, waterproof and light, and a useful building stone.

#### **What the United States Purchases from Argentina.**

Including \$22,895 worth of returned American goods, the exports to the United States declared through the consulate in Buenos Aires, for the quarter-year ended March 31, 1912, were valued at \$8,353,387; Porto Rico took \$25,478 worth additional, making a total of \$8,378,865, in comparison with \$8,044,140 during the corresponding three months of 1911. Exports declared at the Rosario consulate during the first quarter of the present year are reported as amounting to \$1,989,872, and at the Santa Fe agency \$159,116; making Argentina's total sales to the United States direct \$10,527,853. The principal articles in the cargoes invoiced at Buenos Aires were: Bones, \$89,372; dried blood, \$10,879; casein, \$66,037; casings, \$62,588; fertilizer, \$50,624; ostrich feathers, \$15,194; fossils, \$17,401; cattle hides—dry, \$1,628,525, salted, \$2,012,919; horsehides, \$46,348; hair (animal), \$95,596; linseed, \$501,682; quebracho—wood, \$14,861, extract \$234,052; calf-skins, \$393,278; goatskins, \$296,009; sheepskins, \$175,434; stearin, \$29,639; wool, \$2,572,441.

#### **Argentine Time-Tables.**

In view of the increased number of American travelers including Buenos Aires and Valparaiso in their itineraries, various time-tables (in Spanish) are transmitted which may be found of interest; also time-tables and schedules showing the accessibility of the Falls of the Iguazu. [These will be loaned by the Bureau of Manufactures.]

### **NEW GOVERNMENT PUBLICATIONS.**

[Announcement of Bureau of Mines.]

Bulletin 36: Alaskan coal problems, by W. L. Fisher. 1912. 32 pp. 1 pl.

Technical Paper 12: The behavior of nitroglycerin when heated. 1912. 14 pp. 1 pl.

Technical Paper 13: Gas analysis as an aid in fighting mine fires. 1912. 16 pp.

Technical Paper 16: The deterioration and spontaneous combustion of coal in storage. 1912. 14 pp.

Miners' Circular 6: Permissible explosives tested prior to January 1, 1912, and precautions to be observed in their use. 1912. 20 pp.

Bulletin 37: Comparative tests of run-of-mine and briquetted coal on locomotives, including torpedo-boat tests and some foreign specifications for briquetted fuel. Reprint of United States Geological Survey Bulletin 363. 58 pp. 4 pls.

The Bureau of Mines has copies of these publications for free distribution, but can not give more than one copy of the same bulletin to one person. Requests for all papers can not be granted without satisfactory reason. In asking for publications please order them by number and title. Applications should be addressed to the Director of the Bureau of Mines, Washington, D. C.

**FOREIGN TRADE OPPORTUNITIES.**

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8956. Tobacco and cigarette machinery.**—An American consular officer reports that the managers of the tobacco monopoly in the country in which he is located recently stated that the business was highly successful. However, they plan further improvement on behalf of the skilled laborers employed and in the introduction of the latest technical inventions which are calculated to reduce the cost of production. Those interested in this matter should communicate at once with an official whose name is given in the report.
- No. 8957. Cutlery, hardware, glassware, and stationery.**—A business firm in India has written to an American consulate that it would like to be placed in communication with American exporters or manufacturers of cutlery, hardware, glassware, and stationery who are interested in pushing the sale of their goods in that market. No references are furnished.
- No. 8958. Soda fountains, fruits, sirups, etc.**—A report from an American consular officer in a Latin-American country states that a firm in his district is of the opinion that there are no soda fountains in use there, but that the installation of one would be a paying proposition. This firm would like to install one, and manufacturers of soda fountains, fruits, sirups, etc., should communicate with it, sending catalogues, illustrations, price lists, etc. Quotations should be given c. i. f. city of destination, and correspondence may be in English.
- No. 8959. Electric power houses and milling plants.**—Owing to the growing scarcity of fuel in a certain foreign country many mining companies are considering the advisability of establishing electric power plants. The initial move has been made by a prominent local firm which contemplates the establishment of a large power house for supplying power to several mines. As mining is very profitable in this country it is expected that other mining companies will require power plants from time to time within the next year or two. Copy of the complete report on this subject, forwarded by an American consular officer, will be sent to interested firms by the Bureau of Manufactures.
- No. 8960. Machinery and automobiles.**—The Bureau of Manufactures is in receipt of a communication from a member of an American firm stating that he will leave shortly for a business trip through England, France, Germany, and Switzerland. He writes that during this time he will have an excellent opportunity to introduce American products in European countries, as he is well acquainted with the automobile and machinery trade, both of Europe and the United States, and has good foreign connections. He would like to hear from any American manufacturers who desire to establish European connections.
- No. 8961. Dredging.**—The American consul general at Ottawa, Canada, reports that the Department of Public Works has advertised for tenders, to be received until June 13, 1912, for dredging required at Yarmouth, in the Province of Nova Scotia. Combined specification and form of tender can be obtained on application to the secretary of the Department of Public Works, Ottawa. Dredges and tugs not owned and registered in Canada can not be employed in performing this work.
- No. 8962. Cast-iron pipe.**—An American consular officer in a European country reports that an association in his district is in the market for cast-iron pipe, and correspondence regarding the same should be sent to an individual named in the report. Copy of the report, giving the quantities and nature of the supplies required, can be obtained from the Bureau of Manufactures.
- No. 8963. Condensed milk.**—An important commission merchant in France informs an American consular officer that he desires the names of American firms selling condensed milk.
- No. 8964. Ropeway for transporting freight.**—An American consular officer has submitted a report in detail regarding a project to establish in the country in which he is located a ropeway for transporting freight. The cost of this is estimated at \$475,000. American firms interested in this proposition can secure further particulars from the Bureau of Manufactures and should lose no time in looking into the matter.

**PROPOSALS FOR GOVERNMENT SUPPLIES.**

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

**No. 676. Tenders for public buildings.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., for the construction (including plumbing, gas piping, heating apparatus, electric conduits and wiring, and interior lighting fixtures) for the following buildings: (1) Until June 28, 1912, for post office and courthouse at Reidsville, N. C. Extension will be two stories and basement, with a ground area of about 1,470 square feet, of nonfireproof construction, brick-faced, and slate roof. (2) Until June 29, for post office at Austin, Tex. Building is two stories and basement, stone and brick faced, of fireproof construction (except roof), with a ground area of approximately 15,200 square feet. (3) Until July 8, for post office at Portsmouth, Ohio. Extension is to be of one and two stories and basement, of approximately 2,100 square feet ground area, brick-faced, with slate roof, and of nonfireproof construction, except the first floor. (4) Until July 2, for post office and customhouse at Traverse City, Mich. Work contemplated is construction of a one-story basement and attic extension of about 1,900 square feet ground area, fireproof construction, stone and brick facing, and tin roof, and certain remodeling and repairing of the present building. (5) Until July 3, for post office at Billings, Mont. Building is three stories and basement, with a ground area of approximately 7,250 square feet, fireproof construction, stone and brick facing, and tin roof. (6) Until July 9, for post office at Evanston, Ill. Work contemplated is a one-story basement and mezzanine extension of about 3,300 square feet ground area, fireproof construction, stone facing, and tin roof, and certain remodeling and repairs of present building. (7) Until July 10, for post office at Lansing, Mich. Extension is about 38 by 74 feet, two stories and basement, stone-faced, slate roof, fireproof construction. (8) Until June 24, for post office and courthouse at Pittsburgh, Pa. Drawings and specifications covering all these buildings can be obtained from the Supervising Architect, or from the custodians of sites at the various points.

**No. 677. Sand and gravel.**—Sealed proposals for furnishing sand and gravel will be received at the United States Engineer Office, Seattle, Wash., until June 28, 1912. Information on application to J. B. Cavanaugh, Major, Engineers.

**No. 678. Waste paper.**—Sealed proposals for the purchase and removal of waste paper of the Department of the Interior and its several bureaus in Washington during the period from July 1, 1912, to December 31, 1912, will be received until June 11, 1912. The estimated quantity of waste paper for the six months is 300,000 pounds. It is required that the paper be removed weekly from each of the buildings. Blank forms for proposals may be obtained by application to the Secretary of the Interior, Washington, D. C.

**No. 679. Electric push-button lift.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until July 5, 1912, for an electric push-button lift in the United States post office at York, Pa., in accordance with specifications, copy of which may be obtained from the Supervising Architect.

**No. 680. Portland cement.**—Sealed proposals for furnishing 200,000 barrels of Portland cement will be received at the United States Engineer Office, Seattle, Wash., until July 1, 1912. Information on application to J. B. Cavanaugh, Major, Engineers.

**No. 681. Grading, roadway, and wireless ground system.**—Sealed proposals for grading, roadway, and wireless ground system at naval reservation, Arlington, Va., will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 22, 1912. Plans and specifications can be obtained on application to the bureau.

---

**Bound Volumes of Daily Consular and Trade Reports.**

The Government Printing Office will supply regularly in quarterly volumes, with complete 32-page indexes, bound sets of Daily Consular and Trade Reports from January 1, 1912. The price is \$1.50 per volume or \$6 per year, in order to cover the cost of the index and binding. Those desiring the bound volumes should write to the Superintendent of Documents, Government Printing Office, Washington, D. C.

**ADMINISTRATIVE CHANGES IN CHOSŌN.**

[From Vice Consul General Edwin L. Neville, Seoul.]

In the instructions given by the Governor General of Chosŏn (Korea) to the provincial governors at an assembly in Seoul in April reference was made to the recent administrative changes in the Government General, to the civil and criminal ordinances, and to the ordinances relating to immovables. The object of all of these laws is said to be to facilitate the despatch of governmental business, to provide for the people a clear statement of their rights and duties to each other and to the Government, and to establish a means for verification of property rights. The effect is to put into force in Chosŏn, so far as may be, the administrative system in vogue in Japan proper. The provincial authorities were asked to exert their best efforts to spread an understanding of these laws among the people.

The Governor General also urged that State aids for the development of productive enterprises should be used carefully, with special reference to the encouragement of rice and cotton cultivation, cattle breeding, and sericulture. He stated that with proper guidance some 80,000 horsepower for the use of hydroelectric plants could be obtained from the unused watercourses of Chosŏn. New roads are to be built and a new cable laid between Chosŏn and Japan. [Mention of this new cable was made in Daily Consular and Trade Reports on Apr. 13, 1912.] Telephone and telegraph lines will be increased. Railway fares have recently been reduced, and through trains will soon be run between Fusan and Changchun. The governors were urged to make suitable preparation for the increase in travel which is expected to follow these improvements.

From an American standpoint a noteworthy feature of the Chosŏn criminal causes ordinance, which went into effect April 1, 1912 [and a translation of which is filed for public reference in the Bureau of Manufactures], is the granting to police officials of the same powers, so far as search and examination are concerned, as are granted to procurators of local courts. The State, represented by the procurator, has the same right of appeal as a defendant. The ordinance, which is not retroactive, repeals the old Korean criminal law.

American interests will not be affected by these new laws; and it may be stated that one who is at all acquainted with Japanese methods need have no difficulty in Chosŏn.

---

**Canadian Plan for December Lake Freight.**

It is announced that the Canadian Minister of the Interior has been in conference with the marine insurance and navigation companies of Toronto with the object of working out a plan for extending the season of navigation to the head of the Lakes. It is proposed to keep the Lakes open during December in future, thereby allowing the shipment of 15,000,000 to 20,000,000 bushels of wheat more than has hitherto been shipped during the season. Additional lighthouses and ice breakers would be required.

## FISH TRADE AND INDUSTRY.

### NORWAY.

[From Vice Consul General Haakon E. Dahr, Jr., Christiania.]

Excepting agriculture, the fisheries furnish employment to, and are the principal source of income for, the largest portion of the Norwegian people. They may be broadly classified as local fisheries and fisheries in foreign waters. The local fisheries cover winter and other varieties of cod, herring, sprat, coalfish, halibut, flounders, lobsters, salmon, etc.; also fresh-water fish. The foreign fisheries cover the catch of whales, walrus, seals, etc.

#### Local Fisheries.

The year 1911 was an exceptionally prosperous year for all people interested in fisheries of any kind. The catch of winter cod was larger than in any season since 1897. The number taken in 1911 is placed at nearly 64,500,000. The output of medicinal cod-liver oil approximated 43,318 barrels. The herring fisheries gave the following large returns: Winter herring, caught during the winter of 1910-11, 220,000 barrels; spring herring, 674,000 barrels; other, 530,000 barrels; total, 1,424,000 barrels. Many of the herring were small and of poor quality, only suitable as material for the herring-oil factories. The prices paid the fishermen varied all the way from 3 crowns (80 cents) and less to 20 crowns (\$5.36) per barrel for the raw product.

The catch of sprats in the Stavanger district alone is placed at 508,000 skjepper (a measure holding about 18 liters or one-half bushel), with a total value of \$380,200 for the raw product. The quality was good as a rule. The price paid to the fishermen fluctuated, the average during the season being about 2.80 crowns (75 cents) per skjepper. Some 35,000 skjepper were prepared as anchovies and the remainder as sardines. It is figured that 80 boxes of sardines may be packed from the contents of 1 skjepper of sprats. The 1911 catch of sprats in the whole Kingdom is estimated at 600,000 skjepper.

The quantity of mackerel salted was 50,247 barrels, nearly all prepared for the United States market. The prices paid the fishermen ranged from 25 to 95 öre (6.7 to 25.5 cents) per kilo (2.2046 pounds).

**Foreign Fisheries.**

The whale and seal fisheries in 1911 were carried on with more energy than in any previous year, and the profits have been so large that it is difficult to name any industry which has proved more remunerative. Many new whaling companies have been organized during the year. It is easy to obtain loans in the banks for shares in whaling companies, because in some instances dividends of 100 to 150 per cent have been realized. The rich catch in the South Sea regions and the advance sales in 1910 at high prices secured a handsome dividend to the shareholders; and in spite of the great quantity of oil which was brought on the European markets in the spring, prompt oil was not obtainable during the summer of 1911. The official statistics give no exact figures of the amounts received from sales of whale oil, and such data are not easily obtained, for the reason that the larger portion of whale oil and other whale products is disposed of in foreign ports. The total gross returns for the season 1910-11 is variously estimated by statisticians to be \$5,896,000 to \$6,700,000.

The number of limited companies which will fish for whale in 1912 in the South Sea will be about 35, in addition to the 20 existing companies that fish in the northern seas. Two large companies have also been started to fish under the American flag from Alaska, and four or five companies are at present in course of formation. The Norwegian shipyards have been much occupied in building whaling boats, several of the companies having been compelled to contract with foreign shipbuilders.

**Whales Plentiful in Southern Waters—Prices.**

Whales appear to be most plentiful in the southern seas, around South Georgia, South Shetland, Kerguelen, and on the coasts of South America and Africa. They are evidently decreasing in numbers in the northern seas and the catches there made have been rather light. Some of the more conservative whalers predict that the industry will soon become less profitable in all waters owing to scarcity of whales.

Prices obtained for whale oil were quite satisfactory in the beginning of 1911, at which time No. 1 grade was quoted as follows: Christiania, 11.26 cents per 2.2046 pounds; Glasgow, \$116.80 per long ton; Hamburg, \$11.19 per 220.46 pounds. In the summer and fall prices declined, and in December were, respectively, 9.6 cents, \$97.33, and \$9.52. It is estimated that the world's production of whale oil in 1910 was 600,000 barrels of 375 pounds, and that of this some 344,000 barrels were secured by the Norwegian whalers.

For whalebone the prices were high, quotations per long ton having been: For bone of right whale, \$6,800; finback whale, \$365; inferior quality bone, \$136. Whale guano brought \$4 per 220.46 pounds, and bottlenose oil sold for \$136 to \$160 per long ton.

**New Refinery for Whale, Seal, and Fish Oils.**

A new Norwegian industry has been established at Christiania for refining whale, seal, and fish oils on the system which is patented and used by the Bremen Besigheimer Oelfabriken, Germany. The Norwegian company is styled De Nordiske Fabriker A. S., with main office at Christiania. The share capital is to be \$804,000, of which the Bremen company receives \$268,000 in free shares as payment for the system and patents. Of the remaining \$536,000, the promoters have subscribed \$398,248. When the balance, \$137,752, was offered for subscription, the amount was oversubscribed at least three times.

A plant is to be built by the German company for account of the Norwegian interests, which the former guarantees to cost not more than \$241,200. The German company further guarantees the output of the works and the quality of the product, but reserves for itself the right to nominate one-half of the members of the board of directors and representatives.

[A comprehensive review of Norwegian whaling methods was published in Daily Consular and Trade Reports on Feb. 19, 1907, and a more recent article appeared in the issue of Mar. 25, 1912.]

[From Consul P. Emerson Taylor, Stavanger.]

#### Importance of Fishing Industry to Norway.

While the Stavanger consular district preserves and exports about five-sixths of all the canned fish products shipped from the entire Kingdom, other parts of Norway are more largely interested in catching the fish. The following table, showing the catch of the chief commercial fish for the entire Kingdom in 1909 and 1910 and for the Stavanger district in 1910, has been compiled from recently published official statistics:

Kinds of fish.	Quantity.			Value.		
	Kingdom of Norway.		Stavanger district.	Kingdom of Norway.		Stavanger district.
	1909	1910	1910	1909	1910	1910
Cod.....number..	56,207,800	55,335,200	140,000	\$4,862,030	\$5,056,431	\$12,186
Herring and sprats...barrels..	2,841,094	2,873,216	563,448	2,643,977	4,227,395	634,892
Mackerel.....number..	14,931,163	15,308,238	1,994,133	373,592	447,292	56,548
Coalfish and ling.....				2,982,469	2,853,812	108,835
Salmon and trout.....pounds..	1,870,086	1,490,449	111,813	223,770	273,083	21,494
Lobsters.....number..	1,249,533	901,094	187,374	307,604	248,758	54,082
Oysters.....				2,760	2,734	589

The number of persons engaged in fishing as a vocation throughout the Kingdom who are registered and insured under the fishermen's insurance law was 89,925 in 1910. Of these, 5,709 were from the Stavanger district. Ninety women, 37 of whom were from this district, are included in the total, which may be further classified as follows: Sea fishermen, 66,536; fiord fishermen, 21,834; whalers, 1,555. The corresponding figures for the Stavanger district were 2,462, 3,225, and 22. There are in the entire Kingdom 183 steamers engaged in fishing, of which 22 are in the Stavanger district. There are several thousand sailers, motor boats, and small rowboats used in the fisheries.

#### Market for American Motors and Motor Boats.

Because of the financial and commercial interest of the Stavanger district in the catching of fish, there is a constant opportunity in this city and the other towns of the district for the sale of American motors and motor boats. Reports have been made from this consulate a number of times on the opportunity for American motors in this market. (See Daily Consular and Trade Reports of Apr. 9, 1910, and May 19, 1911.)

The indications are that manufacturers in the United States are becoming alive to the fact that the market is an attractive and lucrative one for American dealers, for there has been a very marked

increase during the past year in the sales of American marine motors. One firm alone in this city reports the sale of several motors each month during the year. Some local agents keep American motors regularly in stock and are able to demonstrate them to prospective buyers. [A list of Stavanger dealers in marine motors is obtainable from the Bureau of Manufactures.] If American firms handling other lines of goods, especially machinery, would realize what the dealers in marine motors have evidently realized, namely, that it is not good business policy to attempt to transact their Stavanger business through a general agency in Hamburg or Copenhagen, they would meet with better success in entering this market.

The firms in this city handling American motors without the intervention of a European general agency all report most favorably upon this direct representation, and the steadily increasing sale of the motors shows most satisfactory results. There has on the other hand been much dissatisfaction, and many complicated mistakes have occurred, through the practice of those American firms which insist that all their Norwegian purchasers must buy goods through a Hamburg or Copenhagen general agency.

#### SWEDEN.

[From Consul Stuart J. Fuller, Gottenborg.]

The fisheries of the Gottenborg district are important. Their operations extend not only along the coasts and out to sea but also to the lakes and rivers. The residents of Bohus County are regarded as among the most skillful of the northern fishermen. Herring is the most important fish, but the catch also includes cod, haddock, mackerel, plaice, whiting, sole, brill, halibut, eels, lobster, salmon, oysters, and shrimps. Herring is exported fresh to England and Germany in the winter. Salt mackerel, anchovies (spiced small herrings), and some dried fish are exported to the United States.

The estimated total value of the catch for the season ended March 31, 1911, and the preceding six seasons was as follows: 1910-11, \$2,351,122; 1909-10, \$2,004,419; 1908-9, \$1,978,615; 1907-8, \$1,554,342; 1906-7, \$2,103,770; 1905-6, \$1,468,053; 1904-5, \$1,266,626.

The business was greatly benefited by the opening of the fishermen's sales harbor at Gottenborg in 1910. Auctions are held at this harbor at stated intervals and buyers attend from all over Sweden and various parts of northern Europe. It has been found necessary to extend the facilities of the harbor basin. The Gottenborg experiment has proved such a success that in 1911 the Riksdag appropriated nearly \$750,000 for the construction of 24 others in small Swedish ports, convenient to the fishing grounds.

#### The Herring Fisheries.

Exports of salt and fresh herring from Gottenborg for the past four years were:

Years.	Fresh.	Salt.
	Pounds.	Pounds.
1908.....	54,783,700	4,681,930
1909.....	40,257,723	2,778,768
1910.....	26,545,121	5,048,108
1911.....	37,020,304	6,183,537

Declared exports to the United States have been as follows:

Kinds.	1908	1909	1910	1911
Canned.....	\$15,871	\$21,537	\$24,837	\$21,268
Dried.....	1,724	1,485	2,094	1,204
Salt and pickled.....	33,104	205,553	204,492	189,862

Careful study of the fisheries has developed the fact that the herring migrates along fixed lines. There are two periods in the season, the first including September and October, when the fishing is in the Kattegat and is done with drift nets, and the second, when the scene of activity moves to the Skager Rack and North Sea, and seines are used. The drift-net fishing in the fall does not yield large catches, but the quality of the herring is better, as the fish have just spawned and are fat. The number of herring present in a season seems to vary by periods. The period which began with 1876 and has lasted up to date is regarded as a good one despite poor results shown in a few individual years. During the preceding period, from 1810 to 1876, the supply was so very small that no proper herring fishery was possible.

#### **Ships and Men—Government Aid.**

The open-sea fishing in the Kattegat and off the Shetland Islands employs over 200 boats with crews that total 1,700 men. The mackerel fishery employs 850 boats and about 5,000 men; 5,000 more are engaged in the herring fishery. It is estimated that between 600 and 800 of the fishing boats are equipped with kerosene motors, mostly of Swedish manufacture. The equipment of the boats with motors began 10 or 12 years ago.

The Swedish Government encourages the fisheries by giving loans to individual fishermen and associations of two or three at low interest and on easy terms to buy boats and motors and improve their equipment and facilities. As a result the industry has escaped the control of corporations and is in the hands of individuals and small groups.

#### **SCOTLAND.**

[From Consul E. Haldeman Dennison, Dundee.]

The year 1911 proved a prosperous one for the Aberdeen fishing fleet. The total weight of fish landed was 2,544,471 hundredweight, valued at \$5,217,432, in contrast to 1,934,806 hundredweight (value \$5,012,404) in 1910 and 1,844,418 hundredweight (value \$4,264,483) in 1909. Extensive additions were made to the already large fishing fleet, 24 new vessels having been launched during the year.

Considerable success attended the work of the trawlers in pursuit of herring; in some cases these boats proceeded to Germany to dispose of their catches. Of the Aberdeen fishing fleet, something like 250 vessels operate in the North Sea and off the west coast. Their trips average 8 to 10 days only and they are therefore able to bring in the fish in the very best of condition.

In spite of its remoteness from the large centers of population, Aberdeen, by reason of the excellent quality of its fish, has been able to surmount geographical obstacles, the products of its trawlers finding a ready sale in the southern markets at good prices.

## CANADA.

[From Consul General John G. Foster, Ottawa.]

The market value of fish and fish products taken by Canadian fishermen, in both sea and inland fisheries, during the fiscal year ended March 31, 1911, amounted to \$29,965,433, of which the sea fisheries contributed \$26,122,596, and the inland fisheries \$3,842,837. There were employed 1,680 vessels and tugs and 38,977 boats, the whole manned by 68,610 men. On shore in the various canneries and fish houses there were employed 24,978 persons.

The following table shows the estimated value of fisheries products during the fiscal year 1911 in each Province of the Dominion which produced a value of over \$1,000,000, with the increase or decrease compared with the previous year; also the estimated value of the catch of the principal kinds of fish, together with the increase or decrease for each species compared with the fiscal year 1910:

Provinces.	Estimated value.	Increase or decrease.	Kinds of fish.	Estimated value.	Increase or decrease.
Nova Scotia.....	\$10,119,243	+\$2,038,131	Salmon.....	\$7,205,871	- \$693,653
British Columbia.....	9,163,235	- 1,151,520	Cod.....	5,921,248	+2,008,442
New Brunswick.....	4,134,144	- 542,171	Lobsters.....	3,784,000	+ 126,953
Ontario.....	2,026,121	- 151,602	Herring.....	2,278,842	- 475,909
Quebec.....	1,692,475	- 115,982	Halibut.....	1,251,830	+ 11,353
Manitoba.....	1,302,779	+ 290,304	Haddock.....	1,218,750	+ 389,206
Prince Edward Island....	1,158,708	- 43,840	Whitefish.....	1,004,504	- 16,532
			Trout.....	1,025,300	+ 304,167
			Smelts.....	797,086	- 71,776

[For a review of Canada's fisheries in the fiscal year 1910, see Daily Consular and Trade Reports dated May 31, 1911.]

## URUGUAY.

[From Consul Frederic W. Goding, Montevideo.]

The existence of both fur and hair seals on the islands and coast of Uruguay has been known for many years, but although numerous computations have been made of each, the number has never been definitely arrived at.

During 1906 an Executive decree, which has all the force of law, made provision for the punishment of persons convicted of unlawfully killing seals and arranged for the immediate sale of the skins captured, provided that, at the trial of the culprits, proof of legal ownership was not established. Formerly the privilege of killing seals was leased to the highest bidder; but on June 15, 1910, an Executive decree was issued transferring the sealing rights to the Direction General of Valuations and Administration of State Property, which office has since operated the business. During the past season 2,997 fur seals and 4,850 ordinary seals were killed, the skins and oil, which were sold in the London market, giving a net profit of nearly \$39,000, yet no young animals were slaughtered. It has been stated that when properly organized the industry will furnish an annual revenue of more than \$70,000.

The punishment given to former poachers has completely stopped their work, so that at present nothing of the kind is done. [Copies of the two decrees referred to above will be loaned by the Bureau of Manufactures.]

## CHILE.

[From Consul Alfred A. Winslow, Valparaiso.]

The whaling industry is of growing importance in Chile. The Corral Whaling Co., with headquarters at Corral, gives employment to 200 men, of whom 30 are Norwegians. Two hundred whales is the average annual catch, from which 10,000 barrels of oil are extracted. The largest whale so far caught by this company measured 125 feet and yielded 100 barrels of oil. This company has four fully equipped steamships (flying the Chilean flag), together with a floating factory for use on the high seas and a shore plant for extracting and refining whale oil and converting the refuse bones and flesh into fertilizer, which latter sells for about \$35 United States gold per ton. The average daily wage paid the workmen is \$1.10 gold.

There are two whaling companies operating in Chile, the other being in the Magellan country, and there is talk of others being formed with abundant capital to push the business on a more extensive scale. The output of these two plants for 1911, covering oil, whalebone, and fertilizer, amounted to \$3,893,200.

## WHALING IN SOUTHERN SEAS.

[From Consul General R. M. Bartleman, Buenos Aires, Argentina.]

The January number of the *Revista Zootécnica*, published in Buenos Aires, contains an article on whaling, and gives some data sent by the consul general for Argentina in Christiania.

This article shows that the numerous uses which have been created for whale oil and other whale products have led to a very profitable development of the whaling industry; notwithstanding the constantly increasing quantity of oil and whalebone put on the market, the prices continue to rise. A Norwegian whaling company, operating with remarkable success in the Antarctic seas, recently paid dividends equal to 70 to 85 per cent of the capital invested. The demand for whale products is so great that 75 per cent of the catch for 1910 was sold in advance. A catch of one whale a week per vessel is considered very satisfactory. A year's catch of 52 whales yields 160 tons of oil, 10 tons of baleen, and 1,000 tons of bones. The Greenland whale and the Antarctic whale are the most valuable for their whalebone. The blue whale is most interesting for its strenuous resistance to capture.

The harpoon used in whaling is a deadly weapon of marvelous intricacy. It is shot from a cannon, which can be focused with great rapidity at any angle from its pedestal on the specially constructed ship. On penetrating the body of the whale, the point of the harpoon explodes, and its four hooks spread out in the flesh, securely holding the shaft of the harpoon, which ends in a ring carrying a strong cable. Held by this cable, the struggling whale tows the boat after it at a terrific speed until forced by its wounds to succumb. The periodical further states:

**The Magallanes Company—Norwegian Enterprises.**

In the Magallanes Territory of Chile whaling constitutes a very lucrative business, the *Sociedad Ballenera de Magallanes* having obtained net profits of £32,000 sterling on a capital of £100,000. This company expects to purchase the steamer *Presidente Quintano*, which will make voyages from Buenos Aires to ports of the south to reinforce its fishing fleet. The history of this industry in Magallanes dates from 1902, when

a company was organized to exploit the business of fishing for whales. In 1905 the steamer *Almirante Montt* was specially built for this purpose. In 1906 the Sociedad Ballenera de Magallanes was organized, with a capital, as already stated, of £100,000 (\$486,650). That same year a Mr. Anderson was sent to Europe, and there acquired the steamers *Gobernador Bories*, of 3,000 tons, as a floating depot, large tanks for oil and machinery for handling the whales being installed; the *Almirante Uribe*, of 80 tons, and *Almirante Valenzuela*, of 100 tons; also a sailing vessel, the *Cornelia Jacoba*, of 1,200 tons. From its organization up to 1910 the company has taken 749 whales—right, humpback, finback, blue, and sperm. Its fishing fleet cruises over the south Atlantic and Pacific Oceans, and in the vicinity of the South Shetland Islands. Whales in large numbers are also encountered in the Strait of Magellan and the channels of Tierra del Fuego.

A Christiania newspaper published the following information relative to the Norwegian whale fisheries in 1910: "The year 1910 was the best in the history of the whale fisheries. Not alone was there a vast number of whales caught, but the different products of the fisheries reached the highest price in years. The results of the operations in the vicinity of the island of South Georgia of three Sandefjord (Norway) companies employing four steamers were 1,124 whales, which produced 27,200 barrels of oil. The Ocean Co., of Laurvig, Norway, with two steamers, secured 16,000 barrels of oil. The Condor Co., of Sandefjord, secured 3,800 barrels of oils extracted from the refuse left by other companies. The Tonsberg (Norway) Co. collected 10,800 barrels. This is an aggregate of 57,800 barrels of oil from one island of the southern seas. In South Shetland three companies from Sandefjord, with eight steamers, captured 1,461 whales and extracted 37,500 barrels of oil. Along the coast of Chile, Province of Valdivia, the Sandefjord contingent was able to collect 7,000 barrels; in South and East Africa, 13,000 barrels; in the Kerguelen Islands, where a company from Christiania was also operating, the fishing was not so abundant. To sum up, the three Norwegian villages secured to the end of 1910 the following quantities of oil: Sandefjord, 103,500 barrels; Laurvig, 16,000 barrels; Tonsberg, 10,800 barrels; or a total of 130,300 barrels of oil, without taking into account the other products of the fisheries—whalebone, guano, bones, etc."

[Port Stanley (Falkland Islands) correspondence in Buenos Aires Herald of Mar. 27, 1912; transmitted by Consul General R. M. Bartleman.]

#### The Catch in the Falklands and Other Islands.

Whaling in southern seas is now in full swing; and considering that whaling companies shipped oil, baleen, and guano to the estimated value of \$3,893,200, the proceeds of the last season's catch only, it may be regarded as a paying industry.

When killed, the whales are towed (sometimes two or three at a time) either to one of the 12 large floating factories or to one of the 7 shore works, where the oil is "tried out." All baleen and bones of any value are set aside; scraps and useless bones are used for fuel. Bones "pay their passage" as dunnage between the barrels or tanks of oil. Auxiliary supplies of coal, shooks or staves for barrels, etc., for the factories afloat and ashore are shipped out by sailing vessels or steamers.

With the extensive and increasing destruction of the present day, whales will soon become extinct. In the Falkland Islands and their dependencies alone more than 8,000 whales were taken last season. Factories at South Georgia sent in returns for 5,000 and plants in the Falklands, South Shetlands, South Orkneys, Graham Land, and South Sandwich Group accounted for approximately 3,000. In the latter places there are about a dozen whaling companies, while in South Georgia alone there are seven such enterprises which employ between them over 1,000 men during the season. That returns of the catch and full particulars are to be supplied to the Government is one of the stipulations of the whaling license.

The 50 swift and powerful whalers owned by these companies are equipped with the most modern implements for catching, towing, and manipulating whales, and the large steam floating factories are fitted up with improved machinery and ingenious apparatus for extracting oil. Early in December the floating factory *Ronald Amundsen*, accompanied by three whale catchers, the *Granat*, *Cannon*, and *Harpun*, arrived at Port Stanley from Norway and later sailed for South Shetland. The other floating factories and their attendant catchers were already at the whaling grounds.

A company in which some stock is held locally is endeavoring to establish a depot on the South African coast.

**Tin.**—The Dutch Minister for the Colonies authorizes the Netherlands Trading Co. to announce that the 1911-12 Banca tin production has comprised 250,640 piculs.

**THE CUBAN SUGAR INDUSTRY.**

[From Deputy Consul General H. P. Starrett, Habana.]

The treaty of reciprocity between the United States and the Republic of Cuba, which was negotiated in 1902, allowed a preference of 20 per cent in the duty on Cuban sugar entering the United States. Since that date Cuba has entered upon a period of development that has exceeded the predictions of the most optimistic. Vast new areas of land have been brought under cultivation, new mills have been erected, old mills have been remodeled and improved, and projects are on foot for many additional mills to be built in the near future. So great has been this recent development that it can safely be said that if the present activity continues Cuba will be in a fair way of becoming the largest producer of sugar in the world.

The relations between Cuba and the United States have been so close during the last few years that it is interesting to observe to just what extent American capital has invested in the Cuban sugar industry. A careful estimate of this investment in mills, lands, railroads, and other equipment devoted exclusively to the industry, but not including mortgages, gives a total of \$54,000,000. In this estimate, however, are included a few companies which were organized in the United States and hold charters granted by different States, but whose stock is owned by persons other than Americans. Their investment amounts to a very small percentage of the whole. The distribution of this total investment through the different Provinces of the island is as follows: Pinar del Rio, \$750,000; Habana, \$3,000,000; Matanzas, \$5,750,000; Santa Clara, \$14,500,000; Camaguey, \$4,700,000; and in Oriente, \$25,300,000.

**Extent of American Interests.**

There are in the island at the present time 173 active mills, of which 34 are wholly American owned and 2 partly controlled by American capital. Another interesting fact is that American-owned mills produce nearly 35 per cent of the total sugar output of Cuba. In Pinar del Rio they produce over 22 per cent; in Habana, 15 per cent; in Matanzas, 14 per cent; in Santa Clara, 26 per cent; in Camaguey, 58 per cent; and in Oriente more than 70 per cent. From this statement it can readily be seen that in the Provinces of Camaguey and Oriente the sugar output was largely from American mills, and, on account of the American mills now building and being planned in those Provinces, these percentages will be increased still further within the next two years. Sugar in western Cuba has about reached the law of diminishing returns in agriculture, but the prediction is that eastern Cuba—Santa Clara, Camaguey, and Oriente Provinces—will continue to develop and expand until restricted by the lack of available land or until some unforeseen disaster overtakes the industry.

The impetus given the industry by the recent high prices and the favorable outlook for a continuance of at least a very remunerative price in the future has drawn the attention of many American capitalists to the profits in this field of endeavor; and in view of this interest it would seem that a brief description of the methods of culture and the cost of production, together with an estimate as to the cost of establishing a complete sugar estate in Cuba, might be of assistance. With this object in view the writer has collected, from planters, engineers, and investors in the industry, data bearing on the

cost of production and the profits to be expected. It must be stated, however, that these figures are only approximate and many factors tend to make them vary, such as the location of the plant, price of labor, and whether European or American machinery is used, but the endeavor has been to be very conservative in the estimate as a whole.

#### Location and Fertility Factors—First Investment.

In the first place, it can be stated that perhaps the two most important items to be considered are the fertility and adaptability of the land and the accessibility to transportation facilities. Provided that suitable land can be obtained, the ideal location for a modern mill is on or very near a good harbor, where ships can come up to its own dock. It should have its own railroad to carry the cane from the fields to the mill and to transport the sugar from the mill to the dock. This reduces to a minimum the cost of importing machinery and supplies and of shipping the products of the mill.

Let us take as a basis a sugar estate which will produce 100,000 bags of sugar of 320 pounds each per annum. The amount of land for all purposes—fields, roadways, pastures, timber tracts, sites, etc.—should be about 20,000 acres, and good land of this character would cost \$6 to \$10 per acre, according to fertility of the soil and nearness to transportation facilities. The total first investment for such an estate would be about as follows:

20,000 acres of land, at \$10.....	\$200,000
Clearing and planting 5,000 acres, at \$50 .....	250,000
Oxen and carts.....	60,000
Railroad and equipment.....	260,000
Wharf.....	40,000
Sugar mill and house.....	800,000
Office, store, dwellings, hospital, and barracks.....	40,000
Working capital.....	50,000
Total.....	1,700,000

#### Cultural Methods.

Two general systems of growing the cane are in vogue in Cuba—the “colono” system and the “administration” system. The first contemplates the ownership of the land and equipment by the mill, money being advanced to “colonos” or tenants to grow, cut, and deliver the cane to the company’s railroad, a percentage of the sugar extraction being returned to the tenant in payment for his work. In many instances the “colono” owns his land and equipment, and in such cases the basis of settlement is different only in that the percentage returned to him is larger. These percentages vary according to locality and the number of mills competing for the cane, but it probably averages about 5 per cent of the cane actually delivered to the mill or the company’s railroad. That is, for every 100 arrobas (arroba=25.3664 pounds) of cane delivered to the mill the colono receives 5 arrobas of sugar or the market price for the same.

The second method, that of “administration,” is one in which the company owns the land and either does the whole work through its own employees or lets the different branches of the work out to contractors who perform the work under the supervision of the company’s representatives. One class of contractors cleans the cane rows, another cultivates the crop, another cuts and loads the cane on the cars, etc. This seems to be the preferred method, and this is the one upon which the figures of this report are based.

In Oriente Province the average cost by contract of clearing land, fencing, making roadways, plowing, planting, and cultivating cane to maturity (12 to 14 months from planting) is \$50 an acre. The cane once planted in new and what is considered good sugar land will produce an average crop of 30 tons per acre per annum for a period of 10 years, after which time it would have to be replanted; and the cost of cultivation per year would be about \$15 per acre.

#### **Cost and Profits.**

Taking these general figures as a basis, it would be necessary to plant the first year 5,000 acres of cane, which, at an average of 30 tons per acre, would produce 150,000 tons of cane per annum. Allowing a "rendimiento" or sugar extraction from the cane of 10 per cent, would give a production of 96° raw sugar of 15,000 long tons, or 33,600,000 pounds in all. The average net price for Cuban raws f. o. b. Cuba for the past 10 years, but not including the high prices of 1911 and 1912, was 2.25 cents per pound. It must be stated here, however, that the high prices of 1911 and the favorable outlook as to future prices will considerably raise this average. This production of raw sugar would give approximately 1,000,000 gallons of molasses, and the price for which this could be sold would be about 3½ cents per gallon f. o. b. Cuba. Thus the following statement shows the gross annual income to be:

33,600,000 pounds 96° raw sugar, at 2½ cents .....	\$756, 000
1,000,000 gallons molasses, at 3½ cents .....	35, 000
Total income .....	791, 000

In such a mill located near the coast, with no railroad freight to pay on its product and with efficient management, it is safe to say that the cost of producing this amount of sugar, including cultivation, harvesting, transporting the cane to the mill, railroad operation, mill operation, administration, maintenance, depreciation, insurance, taxes, and all other operating expenses, would not exceed \$550,000, or at the rate of 1.6 cents per pound. The difference between the gross income and the total annual cost would therefore be \$241,000, or slightly in excess of 14 per cent on the investment of \$1,700,000.

#### **Some Authorities Claim Still Higher Returns.**

This, as has been stated above, is a very conservative estimate of the costs and profits obtained from the operation of a modern sugar mill under favorable conditions in Cuba, as the figures for the total investment and those showing the cost of production are probably higher than they would be under skillful management, while the price received for the products would undoubtedly average slightly higher than the figure given. For instance, if such a mill had sold its product for the high prices which obtained during the latter part of 1911, it would have produced a gross income of over \$1,400,000, or more than 80 per cent on the whole amount invested in the plant. Careful students of the industry claim that on the basis of a period of, say, 10 years, there is no reason why a mill properly located and managed should not produce an average net income of 15 to 20 per cent on the actual investment.

[Articles pertinent to the foregoing report appeared in Daily Consular and Trade Reports on Aug. 31, 1910, and Aug. 1, 1911, while

numerous reviews of Cuban sugar-crop conditions and yield have been published from time to time, among which were those in the issues for Aug. 20, 1910; Jan. 7, Mar. 10, Apr. 5, Sept. 30, Oct. 21, and Nov. 9, 1911; and Feb. 16, 1912.]

### HONDURAN BANANAS FOR EUROPEAN MARKET.

[From Consul Claude L. Dawson, Puerto Cortes.]

The first cargo shipment of bananas from Honduras to Europe was dispatched on May 7 from Puerto Cortes by the Hamburg-American liner *Sarnia*, a refrigerator ship of approximately 4,000 tons and 11 knots speed, which is expected to reach Hamburg in about 20 days. It carried 25,000 bunches of bananas and miscellaneous freight. A second sailing is announced for May 31, and it is said the service will be continued indefinitely.

This marks a new epoch in the commercial history of Honduras, and confirms the rumor of an alliance between the Hamburg-American Steamship Co. and the Atlantic Fruit & Steamship Co. for the development of the European banana trade.

Granting the permanency of the service, planters in Honduras will henceforth have a wider market for their fruit and thus be enabled to overcome, to a degree, the losses occasioned by periodic seasons of low prices in the United States, when shipping concerns greatly curtail the number and size of cargoes and consequently leave large quantities of bananas go to waste.

#### Possible Diverting of American Trade.

On the other hand, the new service, with direct transit to and from the principal German commercial center, suggests encroachments on American trade supremacy on the north coast of Honduras. Although it will probably result in increased importations from Germany, it should not immediately or materially affect the volume of American trade with Honduras, since German imports are only 8 per cent of the total and consist principally of articles offering little competition with American goods of similar class.

The contrary might result, however, should similar service be extended to English and French ports—a most likely development if Honduras continues to realize expectations as a principal source of banana supply. English and French goods—particularly textiles and certain food products and breadstuffs—are popular in this district, and under the stimulus of efficient transportation this trade would doubtless rapidly increase; and this economic advantage would be seconded by special inducements from the steamship companies in order to develop general freight traffic to produce revenue to defray operating expenses of ships.

The principal commercial nations of Europe control about 30 per cent of the import trade with this district, notwithstanding adverse transportation facilities which entail one and sometimes two transshipments. American exporters may well consider whether this proportion would likely be increased to 40 or 50 per cent under more favorable conditions. It should not be difficult, considering the preponderating European mercantile influence in these countries, which always maintains close commercial sympathies with the mother countries, whose efficient export-trade departments are always alert and ready to encourage and assist in every possible diversion of business to themselves.

## WORLD'S PRODUCTION OF RAW SILK.

[From Consul Carl Bailey Hurst, Lyon, France, May 10, 1912.]

Provisional statistics have just been issued by the Silk Merchants' Union of Lyon, estimating the production of raw silk throughout the world during the year 1911. These figures are compiled by the union with minute care from original sources and their publication is always awaited with interest in this silk center. The following is the table made public to-day:

Countries.	Pounds.
<b>Western Europe:</b>	
France.....	886, 258
Italy.....	7, 684, 132
Spain.....	184, 007
Austria-Hungary.....	782, 641
<b>Total.....</b>	<b>9, 557, 038</b>
<b>Levant and central Asia:</b>	
<b>Asiatic Turkey--</b>	
Anatolia.....	1, 124, 357
Syria and Cyprus.....	1, 135, 381
Other provinces.....	287, 624
<b>European Turkey--</b>	
Saloniki, Adrianople, etc.....	804, 687
Balkans--Bulgaria, Servia, Roumania.....	429, 902
Greece and Crete.....	143, 300
Caucasus.....	1, 058, 219
Persia and Turkestan.....	1, 212, 542
<b>Total.....</b>	<b>6, 206, 012</b>
<b>Extreme Orient:</b>	
<b>China--</b>	
Exports from Shanghai (including tussahs, yarns, etc.).....	12, 235, 654
Exports from Canton (including shipments to Bombay and India).....	3, 725, 812
<b>Japan--Exports from Yokohama.....</b>	<b>20, 282, 526</b>
<b>East Indies--Exports from Bengal and Cashmere.....</b>	<b>473, 994</b>
<b>Total.....</b>	<b>36, 717, 980</b>
<b>Grand total 1911.....</b>	<b>52, 481, 036</b>
<b>1910.....</b>	<b>54, 002, 227</b>

Exports from Canton for the season 1911-12 cover 11 months instead of 12, following the decision of the committee of silk-exporting firms that, beginning with 1912, the silk seasons should close May 1 instead of June 1. This measure was adopted in order to have the trade records coincide more closely than heretofore with the various annual crops.

[Statistics of the world's raw-silk production in 1910 appeared in Consul Hurst's annual report, published Nov. 15, 1911.]

## AMERICAN EXPERT GOES TO CANADA.

A station note from the Washington Agricultural Experiment Station to the Department of Agriculture at Washington, D. C., reports that Prof. W. T. McDonald, professor of animal husbandry at Washington State College and animal husbandman of the station, has resigned to become Live Stock Commissioner of British Columbia, July 1, 1912. Prof. McDonald received his B. S. A. degree from the Ontario Agricultural College in 1903, and M. S. A. from Iowa State College in 1906. He was associate editor of The Farmer and manager of the Webb-Shaw Experiment Farm, St. Paul, Minn., 1903-1905; was professor of animal husbandry, Oklahoma Agricultural and Mechanical College, and animal husbandman at Oklahoma station, 1906-1908; since then at Washington in his present position.

**CROP REPORT FOR NORTHERN ARGENTINA.**

[From Consul Robert T. Crane, Rosario, Apr. 4; supplementing report in Daily Consular and Trade Reports for Apr. 17.]

Wheat received for export at Rosario and Santa Fe up to March 28 amounted to 195,337 metric tons, which is but two-thirds of the amount received during the corresponding period of 1911. This diminution is not, however, due to an inferior crop, but to the lateness with which all the harvests have commenced this season, and to the lack of transportation owing to recent railway strikes, which have affected all crops. The official standard for wheat settlements has been fixed at 76 kilos (167 pounds) per hectoliter (2.83774 bushels), as against 78 kilos (172 pounds) in recent years; a new standard will be established during April for the remainder of the year, and this will probably be 75 or 75½ kilos (165½ or 166½ pounds).

Linseed has been received to the amount of 71,231 metric tons, seven-tenths of that received at this time last year. The proportion of weed seed is heavy.

Only 4,602 metric tons of corn have been received during the first quarter, or only 4 per cent of last year's receipts at this date. The crop is splendid, and will undoubtedly exceed that of any previous year in Argentina. The official estimate of the Federal Department of Agriculture gives the output for this district as 3,927,000 metric tons and for the entire country as 7,515,000. This estimate would appear, however, extremely optimistic, as it is based on a prospective average yield of 39 bushels to the acre. It seems safe to expect a crop somewhat over 5,500,000 tons for the whole country, of which this district will produce some 2,500,000 to 2,750,000 tons.

**SALE OF CHAMPAGNE WINE.**

[From Consul W. Bardel, Rheims, France.]

The Chamber of Commerce of Rheims-Epernay publishes a report on the trade in champagne wine of the Champagne district from April 1, 1911, to March 31, 1912. The report also contains a comparative statement of the sales of champagne in the same periods for the last six years. An extract of this report, and a transcript from the invoice book of this consulate shows the total trade in champagne wine, as also the sales of champagne to the United States during the same intervals, as follows:

Business year.	Total sales in Champagne district.	Total sales to United States.
	<i>Quart bottles.</i>	<i>Quart bottles.</i>
1906-7.....	33,171,395	4,406,580
1907-8.....	33,734,618	3,724,584
1908-9.....	32,705,338	3,661,812
1909-10.....	39,294,526	5,420,316
1910-11.....	38,584,402	1,951,944
1911-12.....	35,688,114	2,775,624

The sales of champagne wine to the United States from April 1, 1911, to March 31, 1912, are thus shown to have increased considerably over the previous year, but they were still much below the average sales of former years. The decrease is supposed to have been due to higher prices for champagne in France as also with the increase in United States customs duties on sparkling wines.

**GREEK FINANCE COMMISSION'S REPORT.**

[From American Minister Geo. H. Moses, Athens.]

The Fourteenth Annual Report of the International Finance Commission, covering the Greek calendar year 1911, shows that the total revenue passing through the commission's hands during the twelvemonth was \$11,920,354, itemized as follows: Salt, \$626,462; petroleum, \$974,335; matches, \$375,955; playing cards, \$80,342; cigarette paper, \$577,456; tobacco, \$1,445,956; stamped paper, \$2,379,702; Naxos emery mines, \$202,215; Piræus customhouse, \$5,257,931. This compares with a total of \$11,228,065 for the previous year and shows an increase of revenue from salt, matches, stamped paper, and customs. Petroleum, playing cards, and Naxos emery show a slight diminution; while cigarette paper and tobacco remain stationary at the point guaranteed by the Greek Government by the law of 1909, whereby these items were transferred from the commission to governmental control. The largest gains were in stamped paper and Piræus customs receipts, being \$283,342 and \$425,462, respectively.

As a result of the year's operations the commission was enabled to devote \$751,352 to the increase of interest payments to bondholders and \$618,530 to the increase of the sinking fund. The expense of the commission was \$46,610, and the surplus turned over to the national treasury was \$5,943,729, or \$1,215,714 more than in 1910.

The rate of exchange throughout the year was practically at par, varying from 99.61 in January to 100.16 in April. The mean exchange for the year was 99.936.

[A summary of the commission's report for 1910 was published in Daily Consular and Trade Reports on June 13, 1911.]

---

**A NEW GOVERNMENT YEARBOOK.**

[Review by Superintendent of Documents, Government Printing Office.]

The eighteenth number of that standard annual, the 1911 Yearbook of the United States Department of Agriculture, is now available, being for sale by the Superintendent of Documents, Washington, D. C., at \$1 a copy.

It is a cloth-bound book of 732 pages, containing 31 special articles by agricultural experts, an appendix of nearly 200 pages carrying a great variety of practical information, 20 text figures, and 67 full-page plates, of which 9 are in colors. The subjects illustrated are birds, fruits, insect pests, forest plantations, molds, yeasts, irrigation, crop-destroying crawfish, foresting, canning in factories, July snow scenes in the mountains, a new respiration calorimeter, etc.

The Superintendent of Documents has learned through his extensive correspondence with citizens who are interested in United States public documents that many suppose this yearbook to be a collection of bulletins and circulars previously published in separate form. This is an erroneous supposition. The entire contents of the yearbook are prepared especially for it and have not been previously published in any form. They are subsequently republished in a series known as "yearbook separates;" that is, each of the special articles is printed in a separate small pamphlet, so that those who wish some one article can be supplied without sending them the whole book. This is an economy and may almost be said to be a necessity, because the allotment of yearbooks to the Department of Agriculture is sufficient to supply copies to only a small part of the citizens in all parts of the country to whom the department is under obligation for information and assistance of various kinds. Being unable to supply complete yearbooks to all its volunteer helpers, the "separates" are made to serve as a more or less acceptable substitute. The "separates" are also on sale by the Superintendent of Documents at 5 cents each.

Though the 1911 edition of the yearbook is not published till 1912, its statistical records are as nearly as possible brought up to the time of going to press.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

**No. 8965. Kerosene engines.**—An American consul in the Far East reports that a local firm has requested to be placed in connection with American manufacturers and exporters of kerosene engines suitable for running light machinery. This firm wishes to know the full particulars as to the f. o. b. prices of the engines in the United States, less trade discounts; also cost of running the engine and such other information as will serve to give it enough data to make purchases if it should so decide. It should be distinctly understood that it is useless to address this firm in regard to gas or gasoline engines, as kerosene is the only practical power in the country in question.

**No. 8966. Steel plant and shipbuilding machinery.**—According to the report of an American consular officer the next few years will see a great revival of the shipbuilding industry in the country in which he is located, and there is every indication at present that determined efforts will be made to put new life into this industry. The consular officer would like to have as soon as possible catalogues of machinery for steel plants and shipbuilding. The machinery eventually needed in these plants will be such as reduce iron ore by electricity and in shipbuilding machinery that will equip ships for oil fuel.

**No. 8967. Machinery, tools, and hardware.**—A new hardware store has been opened in a South American country, and the proprietor has informed an American consulate that he will limit his stock to goods of American manufacture. He is desirous of receiving catalogues from hardware houses in the United States. He intends to make a specialty of the following goods: Carpenters' hand tools, hand-power machinery, mechanics' tools, builders' hardware, furniture and woodwork ornaments, trunk manufacture, etc. He is anxious to get into touch with the manufacturers or exporters of these articles as soon as possible. Correspondence may be in English or Spanish.

**No. 8968. Sheet iron, garden tools, wire, and wire nails.**—The manager of a foreign business firm has requested an American consulate to secure catalogues and prices of galvanized and plain corrugated sheet iron, spades, and shovels, with and without handles, hoes, with and without handles, barb wire, and wire nails.

**No. 8969. Representation in Germany.**—The Bureau of Manufactures is in receipt of a communication from an American mining engineer, stating that he is experienced in European business methods and desires to act as buying or selling representative in Germany. American exporters or importers of ores, metals, mining machinery, and engineering appliances can obtain direct representation. References are furnished.

**No. 8970. Automobiles.**—An American consul reports that a firm of bankers and general merchants is contemplating the resumption of an automobile service between two points in his district, a distance of 5 miles. The firm considers the undertaking a profitable one and is now seeking a suitable car for the work. The car must be of simple construction and geared in such a way as to take the many severe grades encountered between the two points. The high cost of gasoline in that part of the world should be kept in mind also by prospective bidders. Copy of the complete report, containing further details, will be sent to interested firms by the Bureau of Manufactures.

**No. 8971. Boat.**—The Deputy Minister of the Naval Service, Ottawa, Canada, invites tenders for a steamer for fishery protection service (coal or oil fuel; if latter, heavy Diesel engines of the two-cycle reversible type, capable of using Texas or other heavy oil). Particulars may be obtained of G. H. Desbarats.

**No. 8972. Floating crane.**—The Tender Board, Adelaide, Australia, will receive tenders for one 50-ton floating crane. Particulars may be obtained of the Agent General for South Australia, 28 Bishopsgate, London, E. C., England.

**No. 8973. Railways.**—The Public Works Department, Madrid, Spain, will receive tenders until July 1 for the construction and exploitation of railway from Priego to Fernan Nunez.

## NORWEGIAN DAIRY INDUSTRY.

[From Consul P. Emerson Taylor, Stavanger.]

Next to the canning and preserving of fish and fish products, dairying has become the chief industry of the Stavanger consular district, there being 35 dairies here. Only six of these are operated by individuals or partnerships, the remainder being stock companies, most of which are organized on the cooperative plan.

A few of the cooperative dairies have leased their plants to private individuals or firms, which make a three-year contract with the dairy company to pay a fixed price during that time for all milk delivered, and, in addition, to pay 8 per cent net on the cost of the plant or the amount of capital invested.

There were formerly several ordinary stock-company dairies in this city, but they have now consolidated into one constituting the largest dairy in the district. The plan of organization and operation of this company is largely followed by the others in the district and is as follows: The capital stock is 175,000 crowns (\$46,900), divided into 3,500 shares of 50 crowns each. The stock is all owned by the farmers, each being entitled to as many shares as he has milk cows. Stock may be paid for either in cash or 6 crowns (\$1.61) per share per year until it is all paid. Those paying cash receive 5 per cent interest on the amount of their stock besides the dividends. The shareholders have no legal liability beyond the amount of their stock.

### Dividends—Inspection and Instruction.

The payment of dividends is not based upon the capitalization nor the number of shares held by each stockholder, but upon the quantity of milk delivered. Thus, while these payments are called dividends, they are more properly premium payments for the milk delivered. This is the plan followed by the Stavanger dairy, which is by far the largest in the district, and by most of the smaller ones.

There is no official Government inspection, but each of the larger dairies has its own inspector whose duty it is to make periodical examinations of the milk sold, the manner in which the cows are cared

for and fed, the sanitary conditions and cleanliness of barns and yards, the methods of handling and delivering the milk, and to instruct the farmers upon all these matters. These inspections are careful and scientific, and the instruction given to the farmers is of great assistance to them in keeping the quality of the milk up to the highest standard as well as increasing the quantity and butter-producing qualities of the milk.

The largest dairy in the district still buys milk merely by the kilo (2.2046 pounds), while a few purchase it by the liter (1.057 quarts), but a number of the smaller dairies now pay for the milk upon the percentage of butter produced. An effort is being made to have this method of payment adopted generally, as its tendency is to elevate the standard of the milk and dairy products, as well as to promote the raising of thoroughbred cows. At present nearly all the cows of the district are of common breed.

There is a dairy school in the district supported by the Government, where instruction is given. This has also tended to institute more successful and scientific methods of dairying and has raised the standard of quality for butter and cheese. The dairy school affords an entirely separate course of instruction from those offered by the Government agricultural schools of the district.

#### **Regulation of Quotations—Disposition and Consumption of Milk.**

The dairies are entirely separate and distinct and there are no general agreements to pay a uniform price to the farmers for milk. Prices therefore differ, but the variation is only slight. The dairy products, however, are generally all sold at a uniform price. A committee of five members elected by the Christiania Board of Trade publishes daily a schedule of prices for various commodities, including dairy products. The local dairies use this for fixing the prices of the milk, cream, butter, and cheese sold by them.

The largest dairy in the district sells more than half of its milk supply at retail for family use throughout the city. It has 25 retail stores. The remainder of the milk is used for butter and cheese. This dairy in 1911 made a little over 88,000 pounds of butter and about 2,200,000 pounds of cheese. It purchased 21,049,600 pounds of milk in 1911 and 19,976,000 pounds in 1910, but in 1911 returned to the farmers about 11,000,000 pounds of skimmed milk at a nominal price.

The amount of milk consumed by all the dairies of the district in 1910 was 66,357,060 pounds, for which the farmers were paid the sum of \$822,406. Nearly complete returns from the 35 dairies of the district in 1911 indicate that about 74,320,000 pounds of milk were consumed by them during that year.

The second largest dairy in the district sold 2,532,200 pounds of milk in 1911 to the dry-milk factory at Time (Norway) for the manufacture of milk meal.

#### **Prices—Prosperity of Industry.**

The average price paid to the farmers for milk was 2.8 cents per kilo. The skimmed milk is generally used by the dairies in the manufacture of various kinds of cheese, but during the warmer weather of the summer they are unable to use it all, and large quantities are sold back to the farmers at 2 öre per liter (about  $\frac{1}{2}$  cent per quart). The dairies keep no hogs for the consumption of skimmed or sour

milk, and the only by-products manufactured are the various cheeses. A casein factory is being built, and this will in the future take a considerable portion of such products.

The prices at which the butter and cheese were sold during the year varied with the seasons, but the average prices per kilo for the year were as follows: Butter, 59 cents; Dutch clove cheese, 10.7 cents; Gauda (cream) cheese, 18.7 cents; Fad cheese, 16 cents. These are the figures at which the dairies sell to the retail traders and merchants, the prices to the public being about 25 per cent higher than these quotations.

The dairies of the district are all in prosperous condition, and four new ones were built in 1911. From the manner in which they are organized and operated it is difficult to ascertain the exact net dividends they could pay upon their capital stock were all the profits devoted to the payment of dividends. At present improvements in the plants, the installation of more modern machinery, and the division of the profits on the basis of premium prices for milk delivered absorb the profits of the larger establishments. The increase in the dairy industry has meant additional prosperity for the farmers. It is also resulting in the breeding of better stock, in a tendency to more scientific farming in other ways in which the Government has taken a leading hand, and has made the raising of feed crops and of stock the chief feature of farming in this district.

#### **Opportunity for American Goods.**

The steady growth of the dairy industry has opened up a market for several kinds of American machinery. There has been for three years an increasing trade in various kinds of silo machines, feed cutters, mowing machines, and other farm machinery used in harvesting hay, which is much the most important crop of the district. There have also been a number of inquiries at this consulate regarding more modern dairy appliances, and an opportunity is offered American manufacturers of this class of machinery. The growth of the dairies has also increased the sales of stationary engines.

The dairies are usually under the management of farmers and farmers' sons who have taken a regular course of instruction in the dairy school and are equipped with information and some experience in handling up-to-date dairy machinery. The Government, in the establishment of the dairy school and in experimental dairying at this and the agricultural schools, has been of the greatest aid in bringing about scientific dairying, and most of the establishments are supplying their plants with approved modern dairy equipment as rapidly as their growing profits will permit.

As a great part of the output of the dairies in both butter and cheese is consumed locally and large quantities are sent to Christiania, the total output can not be accurately ascertained. The city of Stavanger in 1911 exported to foreign countries 899,490 pounds of butter and 55,462 pounds of cheese. [A list of the principal dairies in the Stavanger district is obtainable from the Bureau of Manufactures.]

---

*Sicilian essential oils.*—In the report on market fluctuations of Sicilian essential oils that appeared in the April 9 issue of Daily Consular and Trade Reports Consul Arthur Garrels requests that the word "quality" (p. 114, line 23) be read "quantity."

**BRITISH MARKET FOR FARM SUPPLIES.**

(From Consul Rufus Fleming, Edinburgh, Scotland.)

**Government Aid to Small Farmers.**

In the small landholders (Scotland) act of Parliament, which became operative on April 1 last, constituting (1) a board of agriculture for Scotland, and (2) a Scottish land court, each with distinct powers to facilitate the creation of new agricultural holdings, an attempt has been made to provide for as great an increase in the number of landholders (tenants) as conditions in this country will permit. The expression "small holding" means any holding which either does not exceed 50 acres, or if exceeding 50 acres is of a rental value as entered in the valuation roll not exceeding £50 (\$243) a year.

The board of agriculture is authorized to arrange with landowners in any and every district where a demand for small holdings exists to meet this demand, so far as landowners themselves do not meet it by leasing small tracts to applicants on satisfactory terms. Failing agreement, suitable land in each district may be compulsorily made available for the registration of new holders, upon payment of compensation for surface damage, etc., on conditions set forth in the act, and at a rental to be fixed by the land court. Only those persons can be registered as landholders whose applications are approved by this court. The Board of Agriculture has power to provide assistance to landholders for dividing, fencing, or otherwise preparing or adapting the land, making occupation roads, or executing other works, such as drainage or water supply, or erecting or adapting a dwelling house or dwelling houses or other buildings, by way of loan or by way of gift, as circumstances may warrant, to be paid out of an agriculture (Scotland) fund, which is an annual grant by Parliament, not to exceed £200,000 (\$973,300). The land court has full authority to determine practically all matters arising between landowners and the board of agriculture as to (1) the land to be taken for new holdings, (2) the rent for such new holdings, and (3) whatever else may be necessary for the purpose of making the scheme effective and of adjusting the rights of all parties interested in or affected by the proceedings. Permanence of tenure is secured to the small landholder and also the right to bequeath his tenancy.

**Immediate Results Secured—Implements Needed.**

Since April 1 upward of 3,000 applications for registration as small landholders have been received by the Board of Agriculture. It is too early to forecast the results of the new method of dividing landed estates into a greater number of separate farms; but the probability is that within a few years the number of tenant farmers in Scotland will be largely increased. The effect upon farm supply trades is a subject of interest to manufacturers of and dealers in agricultural machines and implements, dairy goods, poultry supplies, etc.

The writer is informed that the small-holdings act of 1908, applying to England and Wales, similar in terms to the small landholders' (Scotland) act—except that its provisions are carried into effect by county councils instead of by the Board of Agriculture as in Scotland—and which has resulted in the acquirement of tenancies of land by about 15,800 applicants in four years, occupying 161,000 acres, has noticeably increased the demand in several English counties for

1-horse plows and cultivators and such hand implements as forks, rakes, spades, etc. It is expected that a gradual enlargement of the market for these implements and other farm supplies in Scotland also will result from the operation of the new act. The agricultural cooperative movement has made much headway during the last three or four years in districts where there are many small farms, and with the increase of these small holdings this movement will continue to develop. It is thought that the cooperative purchase of supplies of all kinds will bring about a considerable expansion of the volume of trade, though the margin of profit will be narrowed and some middlemen eliminated.

[A copy of the small landholders' (Scotland) act of 1911 may be seen at the Bureau of Manufactures in Washington.]

### DANISH FLOUR-MILL INDUSTRY.

[From Consul General E. D. Winslow, Copenhagen.]

There were 37 large flour mills in operation in Denmark in 1911, against 38 in 1910. The amounts of grain that have been ground in these large establishments during the last five years are as follows:

Year.	Wheat.	Rye.	Barley.
	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
1907.....	5,468,467	3,060,748	240,106
1908.....	5,169,267	2,966,066	200,750
1909.....	4,929,833	2,985,714	175,083
1910.....	4,785,733	3,091,785	220,116
1911.....	4,520,267	3,117,321	246,583

The falling off in the amount of wheat ground is said to be due to the unfavorable conditions in Denmark for the flour-mill industry.

According to statistics received from 32 smaller establishments, the grinding of wheat has practically ceased in these mills; the grinding of rye, however, has been increasing, namely, from 314,286 bushels in 1910 to 349,643 bushels in 1911, while barley has decreased from 141,666 bushels in 1910 to 116,666 bushels in 1911.

### INTERNATIONAL COMMERCIAL ARBITRATION.

[From the London Times; supplementing statement in Consul General Griffiths' report in Daily Consular and Trade Reports for June 6.]

The British Secretary of State for Foreign Affairs, in replying to a resolution passed by the Association of Chambers of Commerce at its recent annual meeting, expressing satisfaction with the action of His Majesty's Government in taking steps to bring about conventions with foreign and colonial Governments, under which commercial arbitration awards should be made enforceable in all countries entering into these conventions, states that His Majesty's Government is at present in communication with the Governments of the British self-governing dominions in pursuance of the resolution of last year's imperial conference with a view to seeing to what extent and under what conditions it is practical and desirable to make mutual arrangements with a view to the enforcement in one part of the Empire of judgments and orders of the courts of justice in another part.

The Foreign Office concludes with the explanation that, "while the establishment within the Empire of an arrangement of the character indicated is likely to prove a useful step toward a wider application of the principle of recognition of judgments and orders of court, including the question of the appointment of arbitrators, His Majesty's Government deem it desirable to defer the question of negotiating conventions with foreign countries on the subject until after the completion of such an arrangement with the Governments of the self-governing dominions."

**FRENCH DECENNIAL PROPERTY VALUATION:**

[From Consul Louis Goldschmidt, Nantes.]

The results of the decennial valuation of buildings in France show that in the fiscal year 1909-10 there were, outside of public buildings, monuments, etc., 9,475,786 houses and 137,676 workshops and factories in the Republic.

In 15 Departments the number of such structures exceeded 150,000, as follows: Nord, 467,305; Pas-de-Calais, 246,619; Gironde, 239,262; Seine (Paris), 227,328; Seine-Inferieure, 194,404; Seine-et-Oise, 184,231; Loire-Inferieure, 169,312; Charente-Inferieure, 168,052; Somme, 166,029; Cotes-du-Nord, 161,512; Ile-et-Vilaine, 159,065; Puy-de-Dome, 157,198; Aisne, 156,147; Maine-et-Loire, 154,985; and Manche, 150,699. In 68 Departments the houses, workshops, etc., numbered between 50,000 and 150,000; and 4 Departments had less than 50,000 such buildings—Basses-Alpes, 44,143; Lozere, 35,902; Hautes-Alpes, 31,666; and Belfort, 13,097.

The rental value of these 9,613,462 structures is given in the returns as 3,672,142,128 francs (\$708,723,431). The rental value in the Department of the Seine, which includes Paris, is 1,206,851,213 francs (\$232,922,284), practically one-third of the total rental value for the whole of France.

**Real Values—Gains—Advancing Rents.**

The real value of all structures in the Republic, exclusive of public buildings, monuments, etc., is given as 64,798,641,000 francs (\$12,506,137,713), the Department of the Seine accounting for 18,000,000,000 francs (\$3,474,000,000) of this valuation, Nord for 2,000,000,000 francs (\$386,000,000), and Seine-et-Oise and Rhone for 1,000,000,000 francs (\$193,000,000) each. In 23 Departments the real value was between 500,000,000 and 1,000,000,000 francs; between 100,000,000 and 500,000,000 francs in 53 others; and below 100,000,000 francs in Basses-Alpes, Hautes-Alpes, and Lozere.

Compared with the 1900-1901 returns, the valuation made in 1910-11 shows the following increases: Number of structures, 310,854 (3.34 per cent); rental value, 500,000,000 francs (\$96,500,000—15.7 per cent); real value, 7,680,698,000 francs (\$1,482,374,714—13.45 per cent). This gain is significant of the general prosperity of the country during the last 10 years, and is also due to the creation of new factories, railroads, etc., and to the impetus of summer and winter resorts and watering places. On the other hand, to these causes is also due the general rise of rents. An increase of 3.13 per cent is noted in 1910 as compared with 1900, and these figures are no longer accurate, as rents have been steadily advancing since 1910. According to the figures for that year, in the following Departments, the increase was: Alpes-Maritimes, 14.24 per cent (due to the development of winter resorts along the Riviera); Meurthe-et-Moselle, 8.93 per cent; and Savoie, 6.31 per cent (due to the industrial development of these two Departments). However, in 14 Departments the cost of rents has for a time decreased owing to temporary economic conditions, such as bad wine crop, etc.

*Canadian customs revenue* for May was roundly \$9,000,000, the largest monthly collection ever made. It is estimated that for Canada's present fiscal year, which began April 1, the customs collections will exceed \$100,000,000.

**RAW-COTTON IMPORTS OF AUSTRIA-HUNGARY.**

[From Consul General Chas. Denby, Vienna.]

Austria-Hungary imported in 1911 raw cotton to the amount of 425,950,000 pounds, or about 850,000 bales of 500 pounds each, from the following countries:

	Pounds.
United States.....	246,850,000
British India.....	97,900,000
Germany.....	46,400,000
Egypt.....	27,100,000
Asiatic Turkey.....	7,700,000
Total quantity.....	425,950,000
Total value.....	\$60,694,700

Of this quantity the domestic factories consumed about 800,000 bales, 10,000 bales were reexported, chiefly to Germany and Italy, and the balance is in stock or in course of manufacture. The lowest price of raw cotton during the year was 4.92 pence, the highest 7.32.

**The American Trade.**

The shipments from the United States formed 58 per cent of the above total import. The demand for American cotton for the year 1912 is estimated at 600,000 to 700,000 bales, if the year proves normal. The American cotton supplied to the Austrian market comes from all cotton-producing areas of the United States. The sales to the Austrian buyers are made almost entirely by resident brokers representing firms in Philadelphia and elsewhere. The routes of shipment are both through German ports and through the Mediterranean, destination, whether Hungary or Austria, seeming to be the determining factor in choice of port of landing. As to the methods of handling this trade, there is no fault to be found with the credits and payments nor with the transportation; the packing, however, is severely criticized.

One matter which urgently demands attention is imposing, if possible, full responsibility on the railroads for bills of lading issued by them covering cotton shipments. It is worthy of remark that the Austrian spinners have had seriously in mind for some time the purchase of cotton plantations in America to grow their own fiber. This project had a setback in 1911 through lower prices for American cotton toward the end of the year. The Austro-Hungarian cotton-spinning industry is, however, in strong hands, and the trade will not hesitate to grow its own cotton should alleged manipulation of American prices and unsatisfactory packing engender a lack of confidence.

**AMERICAN SECURES AUSTRALIAN CAPITAL PRIZE.**

[European press dispatch from Melbourne.]

The following prizes have been awarded for designs for the Federal capital site: The first, of the value of £1,750 (\$3,516), was awarded to Mr. Walter Burley Griffin, Steinway Hall, Chicago; the second, £750 (\$3,650), to M. Eliel Saarinen, Helsingfors, Finland; the third, £500 (\$2,433), to Alfred Agache, 11, Rue Eugene Flachet, Paris. The awards were made on the recommendation of a majority of two out of three judges.

[The complete topographic drawings, perspectives, etc., of the proposed capital site were forwarded by American consuls in Australia, and supplied by the Bureau of Manufactures at Washington to architects and designers in the United States.]

## BRITISH COOPERATIVE WHOLESALE SOCIETIES.

[From Consul General John L. Griffiths, London.]

An evidence of the increasing prosperity of the cooperative wholesale societies in the United Kingdom is shown by the totals of the last three months of 1911 as compared with the same period in 1906 and 1910. With the exception of the Scottish productive departments, in which there was a decrease of 3.2 per cent, and of the Scottish distributive departments, in which the sales remained practically stationary, very considerable gains were made, the largest percentage of increase appearing in the Irish distributive departments.

During the five years from 1906 to 1911 the rate of increase was far greater in the productive than in the distributive department, the relative figures being 33.2 per cent of the former, as against 22 per cent for the latter, while the gain in five years, taking the departments together, was 24.1 per cent.

The wholesale societies have realized for some time past the necessity of possessing or controlling productive departments, and as a result, in the case of the English section, there was a gain in the five years ending with December 31, 1911, of 42.9 per cent in the productive department as compared with 24.3 per cent in the distributive departments.

In the following table are shown the sales of the wholesale societies of the United Kingdom for the fourth quarter of 1911, with the percentage of increase or decrease as between 1910 and 1911, and also between 1906 and 1911:

Societies and nature of business.	Sales in fourth quarter of 1911. <sup>1</sup>	Percentage of increase compared with—	
		One year ago.	Five years ago.
English wholesale society:			
Distributive departments.....	\$38,785,670	8.9	24.3
Productive departments.....	8,797,644	4.7	42.9
Scottish wholesale society:			
Distributive departments.....	10,506,008	.....	13.7
Productive departments.....	3,519,647	3.2	14.4
English and Scottish wholesale societies' joint committee:			
Productive departments.....	206,057	4.2	24.1
Irish agricultural wholesale society:			
Distributive departments <sup>2</sup> .....	79,275	20.4	200.0
Totals:			
Distributive departments.....	49,381,548	6.9	22.0
Productive departments.....	12,583,328	2.3	33.2
Total.....	61,964,876	5.9	24.1

<sup>1</sup> The amounts given for the productive departments represent sales and transfers to distributive departments.

<sup>2</sup> Decrease.

<sup>3</sup> This society has no productive departments.

## INTERNATIONAL AERIAL NAVIGATION.

[Reuter dispatch from Brussels, May 22.]

The International Commission on Aeronautical Legislation has drawn up a proposed treaty regulating international aerial traffic. This draft convention will be submitted to the International Conference, which will meet in Vienna in June. The questions which have not yet been solved, notably those relating to customs dues and to payments for damage done by air craft, will come up for discussion again at the next meeting of the commission.

**BANKING FACILITIES FOR BRITISH FARMERS.**

(From Consul General John L. Griffiths, London.)

Among the many suggestions for improving agricultural conditions in the United Kingdom the one most frequently made and favorably received deals with the necessity of providing improved banking facilities for farmers.

The president of the Board of Agriculture has effected an arrangement between some of the leading joint-stock banks and the local credit societies whereby farmers may obtain advances upon their own character of securities. Many bills have been introduced into Parliament for establishing land banks, but none have passed. The president of the board of agriculture believes that the best plan is to induce joint-stock banks to make advances to local credit societies through which the farmers largely make their financial arrangements. The Board of Agriculture has prevailed upon six of the largest joint-stock banks in the United Kingdom to "accept credit societies' accounts on terms as to the period of the advance, security, and rate of interest, which will give credit societies as good a chance in this country as they have abroad."

**Present Limitations of Loans.**

There are 44 agricultural cooperative credit societies in England and Wales. The first of these was organized in 1895 at a village in Lincolnshire of about 1,000 inhabitants. Deposits are received by the society at 3 per cent interest. Interest on loans is charged at 5 per cent per annum, and during the past 16 years 78 loans have been effected in sums ranging from \$24 to \$243, the latter amount being the maximum of a loan which is permitted by the friendly societies act.

The money is not indiscriminately loaned since the amount received by the borrower must be expended on some specific object which is approved by the committee of the agricultural credit society. It is ordinarily provided that the loan shall become due at the time when it is thought that the profits of the transaction which the loan is to promote will be realized. The financial position of this especial society is stated to be in every respect satisfactory. No loans are overdue. The average annual expenses are exceedingly small and a fair profit has been obtained. There are 32 members of the society and the average land holding is less than 50 acres. The board of agriculture regards the operations of this credit society as so satisfactory that it has published an account thereof with the hope, doubtless, that similar societies may be formed to a greater extent than heretofore throughout the United Kingdom.

---

**India's Barley Exports Increasing.**

Barley exports from India to Europe are greatly increasing. For the fiscal year ended March 31, 1912, they reached 292,418 tons worth \$7,450,000, against 13,345 tons worth \$330,000 the year previous. A British barley buyer visiting India suggests that "an effort be made to establish the system practiced in the great barley-producing sections of California, where the grain is bagged and placed in railway warehouses against a warehouse receipt which may be hypothecated to a bank against loans."

**AGRICULTURAL PARCEL POST.**

[From Consul Edwin N. Gunsaulus, Johannesburg, South Africa.]

The publication in the February 16 issue of Daily Consular and Trade Reports of an article from this consulate entitled "Farm produce by parcel post," has prompted inquiries from the United States for still further data on this subject, there being a desire for detailed information as to just what success the agricultural parcel post has attained in South Africa.

A request was made of the Department of Posts and Telegraphs of the Union of South Africa for such additional information as could be supplied relative to the subject, and in compliance with this request a letter has been received from the acting postmaster general, setting forth the experience of the post-office administration in connection with the introduction throughout the Union of South Africa of the agricultural parcel post. The information therein contained is here quoted:

Prior to the date of Union, the post was called in the Transvaal the "agricultural parcel post" and in Natal the "produce post." In the Cape Colony and the Orange Free State it had not been introduced.

It is now described as the "agricultural parcel post," but nevertheless all products of the Union, such as gold, diamonds, minerals, wool, ostrich feathers, saddlery and boots and shoes manufactured from leather produced in the Union, confectionery, fruit, plants, seeds, and eatables and drinkables the product of the country, are allowed to pass.

**Articles That May be Sent.**

The interpretation as to what articles can pass is necessarily a wide one. Boots, shoes, and saddlery have imported rivets and eyelets in their production; confectionery has imported flavorings; and medicines and drinkables generally have to be fortified with ingredients that are not produced in the country. Provided, however, the imported additions represent but a small percentage of the marketable articles the latter circulate at the agricultural rate.

Liquids, butter, eggs, and fruits which easily liquify have to be packed in boxes filled with absorbent material. Nevertheless as agricultural parcels are inclosed in bags with ordinary mail matter in the majority of instances, occasional cases occur of breakages resulting in damage to other contents. In a country like the Union of South Africa where there are no less than 1,445 cart, horse, and native-runner mail routes it is impracticable to make up agricultural parcels in separate boxes or baskets excepting between the larger centers.

That the producer and consumer have been brought together through the introduction of the agricultural post is beyond question. The post is largely availed of and is increasing in bulk.

Accompanying this report is a copy of a pamphlet issued by the Department of Posts and Telegraphs detailing the methods and objects of the agricultural parcel post, which is now a recognized and popular feature of the post-office system of the Union of South Africa. [The pamphlet referred to will be loaned to interested persons by the Bureau of Manufactures.]

---

**Incubators for Ostriches and Alligators.**

Incubators for hatching ostriches and alligators might be sold in South Africa, reports Consul General Richard Guenther, of Cape Town. The ostrich-rearing industry is conducted on a very large scale, and the consul general adds that conditions are ideal in certain parts of the country for raising alligators, which would prove profitable if there is a market for the skins—already used to some extent for leather novelties.

**INCREASING HONGKONG EXPORTS.**

[From Consul General George E. Anderson.]

One of the unexpected turns of events in connection with the revolution in China has been that, in spite of disturbance of trade due to the revolutionary movement and notwithstanding the restraining effect of high exchange upon the sale of Chinese goods abroad, the declared exports from Hongkong to the United States during the first quarter of the current year exceeded those for the corresponding period in all recent years. With the exception of the last three months of 1910 the past quarter was the largest of any in the history of the trade. With the immense imports of American flour, which exceeded all imports of such commodity in a similar period, the trade between Hongkong and the United States in both directions was far above the normal.

The total declared exports from Hongkong to the United States during the three months ended March 31, 1912, were valued at \$1,348,161, as compared with \$1,052,699 in the same period of 1911 and \$1,151,530 in 1910. The bulk of these exports consisted of tin, rice, and provisions.

Exports to the Philippines also exceeded those of the same quarter in any previous year, having a declared value of \$1,417,266, compared with \$1,168,287 in 1911. The increase was made up largely of shipments of rice, amounting to \$642,038, against \$513,310 in 1911, and of provisions, which aggregated \$186,160 in contrast to \$32,219 the year before. The change in provisions represents a restoration of the export of lard to its normal volume by the establishing in Hongkong of lard-rendering plants, which meet the requirements of the pure-food laws of the Philippines.

---

**NEW BRITISH VESSELS FOR SOUTH AMERICAN TRADE.**

[From Consul Hunter Sharp, Belfast, Ireland.]

Two new vessels were launched at Belfast on May 16 for the South American trade. The *Darro*, 11,200 gross tonnage, has twin screws and is for the intermediate passenger service of the Royal Mail Steam Packet Co. to Brazil, Uruguay, and Argentina. It will carry a large cargo, having holds insulated for chilled or frozen meat, also compartments insulated for dairy produce and fruit. The engines are arranged on the "balanced" principle, so successful in eliminating vibration. The *Vestris*, gross tonnage over 10,000, for the British and South American service of the Liverpool, Brazil, and River Plate Steam Navigation Co. is built on the Isherwood longitudinal system. The cargo space is divided into five spacious holds practically free of obstruction. Some compartments are insulated for chilled meat, fruit, and produce. Twin screws are driven by two sets of quadruple expansion engines, carefully balanced to reduce vibration.

---

*Modern houses in Malaysia.*—An Eastern journal announces a concession made by the Government of Selangor to the people of Kuala Lumpur (capital of Federated Malay States) throws open a large area of land, off Batu Road, for building purposes, and assists the people with the necessary capital to put up additional and up-to-date houses, which are badly needed.

# FAR EASTERN NEWS.

[From London and China Telegraph; monetary amounts in American currency.]

**Shipbuilding.**—There are 10 steamers of over 3,000 tons burden in course of construction in Japan at the Kawasaki yard, Kobe, and the Mitsu Bishi yard, Nagasaki.

**Chinese gold mines.**—Cheung Kwok-hing, who has returned to Canton after being educated in England, announces that he has discovered several gold mines in the Haiping district and in other localities.

**Mule purchase.**—The Malay States Guides are going to purchase mules for a battery of Mountain Artillery. The mules and their outfit will necessitate an initial outlay of \$18,000 and will cost \$7,000 per annum to upkeep.

**Cotton mill.**—Wong Fookchung has petitioned the provincial Government at Canton for permission to form a limited company to spin and weave native yarns as a means of checking the exodus of China's wealth to foreign nations.

**Office building.**—Another addition is to be made to the new buildings on the Bund at Shanghai, the site selected being at the corner of Canton Road presently occupied by Dodwell & Co. The grounds have been successfully negotiated for by the Union Insurance Society of Canton (Ltd.).

**Bridge or tunnel.**—It appears that two eminent civil engineers are busy comparing the relative merits of a bridge and a tunnel for connecting Shimonoeki with Moji, Japan, and thus establishing railway communication between the two places. [This matter was discussed in Daily Consular and Trade Reports for Nov. 7 and Dec. 15, 1911.]

**Korean gold mining.**—According to the Seoul Press, Mr. Keiichiro Yasukawa, a Japanese millionaire business man, has been granted the right of working six gold mines in Korea (Chosen), 4,540 acres, in aggregate area, at Sinchang Myon in Changrong district, North Pyongan Province, and seven others, 5,460 acres, in aggregate area, at Chongnan Myon in the same district.

**Rebuilding Hankow.**—Influential business men in Hankow are negotiating with capitalists of various Powers to raise a \$3,000,000 gold loan for rebuilding the city and constructing an embankment. The contract for the embankment will probably be given to the Okura Gumi. According to the specifications it is to extend 30,000 feet, starting from the foreshore of the English settlement on the Yangtze and running up along the Han River. Six foreign surveyors are mapping out the site of the proposed bridge across the Yangtze. The plan is to run the bridge from the Snake Hill at Wuchang to the Tortoise Hill at Hanyang. The survey is being made at the request of the Peking Government. [The American press reports that Robt. Dollar & Co., of San Francisco, have been given a \$15,000,000 financing contract for the foregoing work in Hankow and for constructing an electric street-car line there.]

**Japanese gold mining.**—The Jiji Shimpō publishes a long account of a gold mine said to have been discovered along a river some 7 or 8 miles from Hanuzuka Station on the Fukuoka Railway. Recent investigations are said to have showed that one ten-thousandth part of the ore in the vein is pure gold, and it has been estimated by authorities said to be trustworthy that \$1,000,000,000 worth of gold is within easy reach at this place. Applications for mining privileges are pouring into the authorities, and steps have been taken to obtain an official expert opinion.

**Japanese capital investments.**—The Bank of Japan has issued its annual statistics on the amount of Japanese capital invested in business. In 1911 the total invested was \$180,000,000, as against \$243,000,000 the preceding year. Of this amount \$42,000,000 went into electrical undertakings and \$19,000,000 in gas plants. Looking back on previous years, the report recalls that the record was touched in 1907, when the amount of new capital invested was \$334,000,000. This boom, however, soon collapsed, and a reaction followed. In the lean years of 1908 and 1909 the investments were, respectively, \$62,000,000 and \$63,000,000.

**New Japanese industries.**—The Nippon Ginko's investigations show the capital involved in economic enterprises newly mooted or for extending established businesses effected during March amount to \$30,000,000, bringing up the total capitalization to \$73,000,000 since January last. Commenting on this, Baron Shibusawa is quoted as saying that the marked increase in the capital invested in manufacturing industries, aquatic products, and mining business is in keeping with the general trend of economic progress. The growth of the electric business is also a natural sequence. Railway, tramway, and shipping enterprises are also welcome, as they tend to accelerate the general economic development. The enormous increase in capital by spinning mills is no doubt due to a marked increase in the demand in the home market, and also the prospective brisk demand for cotton yarns and cloth in China. The increase of capital in commercial and other undertakings amounts to \$18,000,000.

[From North China Daily News.]

**Industries in Hupeh.**—The Hupeh copper mines in China are being opened. The Portland cement factory at the same place is busy, the half-mile endless wire rope carrying the caeks over fields to the godown by the river.

**Public building.**—The municipal council of Shanghai has decided to appoint a special committee to investigate the whole question of the reconstruction of the central offices on their present site and of the location of a drill hall on that site. It was decided to invite Mr. E. S. Little to join the committee and one other member of the community outside the council.

---

### BRAZILIAN NOTES.

[From Consul Southard P. Warner, Bahia.]

#### **Reduction in Cable Rates from Bahia to Europe.**

The Western Telegraph Co. (Ltd.), which maintains the foreign cable service at this port, has announced a reduction of 20 cents per word in its rates from here to European countries. The following are the rates to the countries in question: To Belgium, France, Germany, Great Britain, and Holland, 65 cents; to Switzerland, 70 cents; to Italy, 71 cents; to Denmark and Spain, 72 cents; to Austria-Hungary, 73 cents; to Norway, Sweden, and Portugal, 74 cents; to Russia, 79 cents. The rate of 90 cents per word to New York was unchanged.

#### **Bahia to Have Automobile Fire-Fighting Apparatus.**

The municipal authorities of this city have called for bids for the following apparatus for the local fire department: Two automobile fire engines, 2 automobile ladder trucks, 2 automobile hose carriers, and 2 automobile ambulances, all to be fully equipped. The notice calling for these bids was published April 20 and required that the bids be submitted within 60 days, so short a period that American manufacturers are excluded from competing for this order, which will doubtless be given to one of the British or German importing firms located here.

Bids for equipments and supplies of various sorts are quite frequently called for by the State and municipal authorities of Bahia, but as the time for submitting such bids is limited to 60 days in nearly every case, it is practically impossible for any but local importing firms to compete for orders of this nature. American manufacturers are not properly represented here, and for this reason a goodly amount of trade here goes to our commercial rivals without any competition on the part of American manufacturers.

---

### **Foreign Trade of Italy.**

Consul General James A. Smith, of Genoa, advises that Italian exports for the first four months of the present calendar year reached a total of \$145,224,745, an increase of \$14,948,674 over the corresponding period of the previous year. Imports amounted to \$219,311,903, a decrease over last year of \$7,014,680.

---

### **Canadian Bank Charts.**

Consul General D. F. Wilber, of Vancouver, learns that the Department of the Interior, at Ottawa, Canada, issues maps of the several Provinces of Canada, showing the location of all the branches of chartered banks in Canada, as well as giving certain data with regard to the banks.

**LEVANTINE BUSINESS NOTES.**

(From the Near East.)

**Roumanian Aerial League—Turkey Buys Aeroplanes.**

An Aerial League has been formed at Bucharest for the purpose of purchasing by public subscription aeroplanes for the army. M. Constantine Olanesco, the President of the Chamber of Deputies, is the first president of the league. Aviation is making good progress in Roumania, and several aeroplanes piloted by young officers took part in last year's autumn maneuvers.

The press at Constantinople announces that the Turkish Ministry of War has placed an order for two aeroplanes with a Bristol company at a cost of \$6,500 each. It is also stated that six officers and five engineers will be sent to the makers to study aviation.

**Works in Cyprus.**

The Cyprus Gazette publishes the text of a bill to authorize the expenditure of \$123,000 on various services, including the purchase of breeding stock, \$7,000; carbonizing plant, \$9,000; machinery and tools for the Forest Department, \$3,250; construction of a lighthouse at Klides Island, \$7,500; improvement of Kyrenia Harbor, \$7,500; construction of a jetty at Limassol, \$5,000; erection of agricultural school, \$6,500; and construction of new bridges, \$7,000.

**Cairo Electric Railways.**

The report of the Cairo Electric Railways and Heliopolis Oases Co. shows an increase in capital from \$6,000,000 to \$10,000,000, due to the fusion of the company with the Société Française d'Entreprises en Egypte. The revenue of the company has reached \$530,000, and, after writing off ample depreciation, the company shows \$114,000 credit balance. There is a constant demand for the land of the company. There are now 938 buildings erected, and private building schemes are increasing. Heliopolis will one day become a very important town. A mosque has been opened since last year. A Catholic cathedral, the building of which is due to private enterprise, is being proceeded with. There are five schools, at which 300 students attend. On the side of sport, racing is looked after by the Heliopolis Racing Club. Polo, cricket, and tennis are all provided for, and a golf course has been opened. The Luna Park attracted great crowds during the summer season, and the hotels appear to have been crowded.

**Large Onion Crop—French Plantation Enterprise.**

The Egyptian onion crop constitutes a record, both as regards quantity and quality. The yield is over 2,000,000 sacks and prices are favorable. [A full account of this onion-growing industry and trade appeared in Daily Consular and Trade Reports for June 8, 1911.]

A French company is negotiating the acquisition of vast domains in Egypt. It is said that the property of Messrs. Cattani & figli in the Gharbia, consisting of 1,500 acres, will be purchased for \$425,000.

**Lower Suez Canal Rates—Dividends.**

The directors of the Suez Canal Co. state that they have decided to reduce their tariff to shipowners, as from the commencement of next year, from 6.75 francs (\$1.30) to 6.227 francs (\$1.20) per ton.

At a board meeting of the Suez Canal Co., held in Paris, it was decided to propose to the general meeting of shareholders on June 3 to fix the distribution of the revenue of 1911 as follows: Per capital share, gross 179,559 francs (franc=\$0.193) net 165 francs; per action de jouissance, gross 154,559 francs, net 141,869 francs; per Founders' share, gross 87,075 francs, net 80,707 francs.

**Tramway Line for Smyrna.**

Representatives of the British European Trust have concluded a convention by which they have obtained from the Imperial Ottoman Government a concession to construct a system of tramways in and about the city of Smyrna. Negotiations are also taking place for the acquisition of telephone and power concessions for the same city.

**Bulgarian Loan for Railway Construction, etc.**

M. Teodoroff, the Bulgarian Minister of Finance, will shortly leave Sofia for Vienna and Paris. It is stated that the object of his journey is to enter into negotiations for the conclusion of a loan of \$40,000,000, of which \$16,000,000 would be applied to the conversion of the 6 per cent 1892 loan and the rest to the construction of railways and other purposes.

**Railway Connections Between Turkey and Bulgaria.**

It is stated by the Constantinople Press that the protocol concerning the uniting of the Turko-Bulgarian railway lines at Kustendje [noted in Daily Consular and Trade Reports for May 14, 1912] has been submitted for final approval, and the Compagnie des Chemins de Fers Orientaux will immediately begin work on the Komanovo-Bulgarian frontier branch.

**Egyptian Delta Railway Extension.**

In order to facilitate the transport of material for Lord Kitchener's Delta drainage scheme [described in Daily Consular and Trade Reports for June 4, 1912] the Delta Light Railways have been commissioned to extend their line from Bielah, in the Mudirieh of Gharbia, in a northeasterly direction, past Abou Badawi, on the Bahr Tيره, and Kafr el Sharki to Salahib, and from thence to Khaassa, where a powerful pumping station is to be erected. The line will then be extended to the village of Baltim, on the western shores of Lake Borollos, 50 miles from Bielah. No time is being lost in constructing the line, the route to be followed having already been surveyed, and material having been collected or cabled for from England.

The Merkaz of Borollos, which the new line will serve, comprises some 40,000 acres and has a population of over 20,000. Apart from the great convenience it will be to the drainage scheme, the line will serve to develop this district and encourage the growth of a large fish, vegetable, and date traffic.

---

**CONSULAR FEES FOR DEPOSITIONS.**

The attention of the Department of State has been called by consular officers to the fact that they are frequently in receipt of requests from legal firms in the United States to take depositions for them, but the necessary amount to pay for fees, services, etc., is sometimes not included with the instructions. Unless these expenses are guaranteed by the party from whom the deposition is taken it has been the practice of consular officers to inform the inquirers and ask for a remittance before proceeding in the matter. Since this necessarily involves considerable delay, it seems desirable that the attention of the public be called to the following list of the official fees in this connection, namely:

For taking depositions, executing commissions or letters rogatory, where the record of testimony, including caption and certificate, does not exceed 500 words..... \$10.00  
For each additional 100 words or fraction thereof..... 50

The foregoing fee shall cover the administration of the oath and all services of the consul as commissioner, but shall not include services of clerk, stenographer, or typewriter, which shall be additional at the rate prescribed herein (in Tariff of Fees) for copying.

---

**THE LOBSTER SEASON EXTENDED.**

[From Consul General James W. Ragsdale, Halifax, Nova Scotia.]

The lobster season in the western part of the Province, from Yarmouth to Halifax, has been extended for 10 days from June 1, the date on which the season would end. This is in response to strong petitions from the western district, and is ordered because of storms in the early part of the season and losses by the fishermen. This extension, under these circumstances, will be a great boon to the lobster fishermen to the west. Halifax Harbor is the eastern limit of the western district.

**Freight rates.**—The German shipping companies have removed the extra 10 per cent added to freights recently as an equivalent for the high coal prices in connection with the coal strike, but only to the Brazils, River Plate, and to the Far East.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8974. Irrigation machinery.**—An American consul has forwarded a report regarding irrigation machinery for land owned by a resident of his district. The area to be irrigated will be 3,000 to 3,500 acres, and the height to which water will be lifted will be 26 to 39 feet. The volume of water to be raised will be 127,000 cubic feet per hour. Windmills might be used to advantage in this undertaking, and information is desired regarding American windmills for this purpose. Information showing the comparative cost of kerosene engines and windmills is also desired. Further particulars regarding the undertaking can be obtained from the Bureau of Manufactures.
- No. 8975. Incandescent lamps.**—A report from an American consular officer states that a European municipality is in the market for about 3,000 incandescent lamps. Specifications, etc., can be obtained by writing to a person named in the report.
- No. 8976. Machine tools for iron and steel plants.**—A business man in a Mediterranean country informs an American consular officer that he desires to communicate with American manufacturers of machine tools of all kinds for iron and steel working, with a view to representing them on that market. He states that he is in a position to furnish satisfactory references and requests that catalogues, prices, and terms be sent to him. Correspondence in English, French, Italian, or Spanish.
- No. 8977. Artesian well machinery.**—An American consul has submitted a report regarding the introduction of artesian well machinery in his district. This proposition, if successfully handled by an American firm, will mean many orders in the near future for artesian well machinery. It is particularly desirable that the matter be taken up by American houses at the earliest possible moment, as the work must be completed within a certain period. Copy of the complete report, giving detailed information regarding the undertaking, will be sent to interested firms by the Bureau of Manufactures.
- No. 8978. Cement.**—According to the report of an American consular officer, certain foreign Government railways are in the market for 2,000 sacks of cement to be used at one of its stations. Specifications and further particulars can be obtained from an official whose name will be furnished by the Bureau of Manufactures.
- No. 8979. Post-office equipment.**—A new building is being constructed by a European Government for its Department of Post and Telegraphs, and an American consul writes that there should be an opportunity for American manufacturers to furnish part of the equipment which will be needed. The authorities are well disposed toward American post-office equipment, and already use stamp-canceling machines of American manufacture. It might be well for manufacturers to send descriptive matter to the official in charge of this matter.
- No. 8980. Soap, oils, chemicals, etc.**—An American consular officer reports that the War Department of the country in which he is located is asking for quotations on certain quantities of Solway soda, elain oil, sulphate of soda, cleaning soap, sulphuric acid, acetic acid, chromate of potash, lubricating oil, spirit of sal ammoniac, petroleum, cylinder oil, white waste, and glue. Further particulars from the Bureau of Manufactures.
- No. 8981. Wood fiber, cotton tubing, and machinery.**—Inquiries have been received at an American consulate for prices, f. o. b. New York or Boston, on wood fiber, in lots of 10 tons. The inquirer believes he can dispose of 50 to 75 tons per annum, if prices quoted can meet German competition. Inquiries have also been received for particulars and f. o. b. prices on wood-fiber machinery, while information is desired regarding the cost of cotton tubing. Samples of the wood fiber and cotton tubing referred to accompanied the report and will be loaned to interested firms by the Bureau of Manufactures.
- No. 8982. Cottonseed-oil cake, linseed cake, and gluten.**—A business man in France informs an American consular officer that he desires the exclusive agency of American exporters of cottonseed-oil cake, linseed cake, and gluten made from corn.

## COMMERCE OF CHINESE PORTS.

### AMOY.

[By Consul Julian H. Arnold.]

Centuries of contact with foreign people through trading have made the Amoy natives acquainted with conditions in near-by foreign lands and the greater opportunities for acquiring wealth which these countries afford have drawn hundreds of thousands of emigrants.

In the southern colonies Chinese have become important factors in commercial and economic development. However, they do not, as a rule, make permanent homes abroad, and are obliged to make remittances from time to time, many of them also returning sooner or later to live here. The amount of money brought into Amoy through these two channels is estimated as far in excess of \$7,000,000 annually, which is the difference between the imports and exports, and the Amoy man is said to possess a higher purchasing power than the Chinese in any other part of China. Some estimates place the amount of money sent and brought here annually from abroad as high as \$20,000,000.

### Paper and Tobacco Trade—Exports to the United States.

While the total trade for 1911 is above the general average for the last 10 years, it is below the returns for 1910. This is said to be due to the revolution. About one-fourth of the exports consisted of native manufactured paper made of bamboo pulp. This paper is shipped to the Chinese abroad, most of it going to those in the southern colonies and Formosa. One-sixth of the exports was made up of tobacco leaf, which also goes to Chinese abroad. The Formosa tobacco monopoly contracts for large quantities each year and in the vicinity of Siokhe, in the interior of this Province, a large two-story building has been erected by Japanese capital, to which the tobacco leaves are brought, assorted, and packed for shipment to Formosa.

Narcissus bulbs are the only articles of export to the United States declared through this consulate. About 3,000,000 of these bulbs go to the American market annually, the declared value in 1910 being \$10,514, and in 1911, \$7,043. The only other item in the declared exports in 1911 was household effects to the value of \$181.

## Import and Export Trade of the Port.

The following is a list of the principal exports and both native and foreign imports of Amoy in 1910 and 1911:

Articles.	1910		1911	
	Quantity.	Value.	Quantity.	Value.
<b>EXPORTS.</b>

During the past 10 years the imports into Amoy from foreign countries have averaged in value about \$7,000,000 annually. Since 1902 these imports have been, as a rule, decreasing, though there has been an increase in the imports of native goods. Both departments of trade showed a decrease over 1910 on account of the revolution.

#### Exports to the Philippines.

The declared exports to the Philippine Islands were as follows:

Articles.	1910	1911	Articles.	1910	1911
China ware.....	\$2,252	\$787	Tea.....	\$0,167	\$1,506

Ironware.....	1,077	486	Total.....	58,877	25,225
Paper.....	6,947	4,029			

#### Conditions in Opium Trade—Short Rice Crop.

Although opium has for many years occupied the first place among foreign imports, yet the figures during the past few years are higher than would have obtained under normal conditions, because of heavy speculation in the drug in anticipation of the absolute prohibition of its further importation. At the end of the year the prohibition of the importation of all non-Indian opium became operative, and December 31, 1913, is set as the last day upon which the importation of Indian opium will be permitted. The price of a chest of opium which was \$400 five years ago was \$1,400 in January, 1911, and in August, 1911, rose to \$2,350. By December 31 it dropped to \$1,750, because of the fact that large quantities of Persian opium, which had to be released from bond before January 1, 1912, were thrown on the market. Taking advantage of the disordered state of political affairs, the farmers in this district have planted large areas in opium poppies.

Next in value after opium are the imports of rice. The local rice crop, which ordinarily is not sufficient to supply local consumption, was below that of normal years. Prices throughout the Orient during 1911 far exceeded those of any other year during the past decade. This section of China generally receives heavy supplies from Saigon, but owing to the short crop there, because of which exportation was prohibited, most of the supply came from Rangoon. During the year the local authorities prohibited the exportation of rice from this district, and this stopped speculation. The high price of rice opened the way for the importation of large quantities of American flour, which finds a ready market here when rice is dear and native flour is not easily obtainable.

#### Cotton Goods Imports—Increased Flour Imports.

The revolution and high price of cotton are partially responsible for the decrease in the imports of cotton goods as compared with 1910. The receipts of native cotton yarn from Shanghai suffered also because watered cotton had been used in its manufacture. The bulk of the foreign cotton yarn comes from Bombay. The only item of the cotton goods trade in which the United States was interested was shirtings, about 10 per cent of which came from the United States via Hongkong.

The cheap cotton prints, lastings, italians, and flannels imported in 1911 came from Germany, Great Britain, Japan, and France.

Of all the foreign imports, flour showed the greatest increase, 150,000 barrels being imported as compared with one-third of that amount in 1910. American flour sold here at 14 cents less per 49-pound bag as compared with 1910. The unprecedented dearth of rice throughout the Orient, with consequent high prices, the floods and famines throughout the wheat-raising areas of central China, the revolution, more favorable exchange rates, and lower flour prices in America all combined to increase the imports of American flour in this port, as well as throughout China, to the highest figures known in the trade.

#### **Increase in Shipments of American Kerosene.**

Another item of American imports which shows a substantial increase is kerosene. The Standard Oil Co. reports a gain of nearly 1,000,000 gallons for 1911 over 1910 and states that, had it not been for the revolution, the year's showing would have been even more creditable. The customs figures show an increase of but 450,000 gallons, but this is undoubtedly due to the fact that certain shipments received at the end of the year were not entered in the customs until the beginning of 1912.

Thus more than 50 per cent of the kerosene imported into Amoy during 1911 came from the United States. The Texas Oil Co. entered the market with an importation of 284,000 gallons.

#### **Fish, Sugar, Tin, and Other Imports.**

Most of the salted and dried fish came from Japan, although perhaps one-fourth was brought from the United States. This is a trade which should receive greater attention from the American dealers on the Pacific coast.

The trade in sugar for 1911 suffered on account of the higher prices. All of the refined sugar consumed here is manufactured in Hongkong, while most of the ordinary white sugar is brought from Java. The higher price of foreign sugar has been an incentive to the local industry, and considerably larger quantities of cane were grown in this district in 1911. Many small modern sugar mills have been erected, representing an outlay of several hundred thousands of dollars.

The tin used here comes from the Federated Malay States and is mainly used in making kerosene cans and tea lead. Practically all the matches imported were from Japan. The consumption of ginseng here continues unabated. The higher the purchasing power of the Chinese, the greater the quantity of ginseng consumed, as its use is confined almost wholly to the wealthier classes. The entire trade is handled through Hongkong dealers, and the United States supplies about 80 per cent of the total amount consumed.

#### **Foreign Medicines, Clothing, Wines, Lamps, etc.**

Imports of foreign medicines, especially proprietary, have increased enormously in the past 10 years. The whole country is being covered with the advertising matter of foreign patent medicine firms, and their wares are finding a tremendous sale among people who have not yet learned to distinguish between the good and bad in this line. The market for ordinary foreign medicines, chemicals, surgical instruments, etc., is also growing rapidly. Recently a representative of a

large American wholesale drug house said that the orders he secured in this consular district far exceeded his expectations. Numerous native hospitals and medical schools are bound to spring up in China during the next 10 years, and these will require surgical instruments, drugs, and chemicals.

The revolution witnessed a remarkable change of attitude on the part of the Chinese of this port, as well as most parts of China, toward things foreign. In South China ports a Chinese with a queue is rapidly becoming a rarity. Foreign hats are now more common than Chinese hats, and foreign clothing and shoes are becoming very popular. There should be a splendid market throughout China for second-hand foreign clothing and cheap foreign hats, shoes, underclothing, and other articles of men's wearing apparel. The Japanese are profiting most by the sudden demand for foreign clothing, and are shipping enormous quantities into China. Chinese tailors are booked for months ahead with orders for foreign clothing, and there is also a big demand for buttons, thread, sewing machines, and tailors' implements.

The amount of beer, wines, etc., consumed in China will increase with the favorable attitude toward things foreign. With the continued war against opium, the smoking of cigarettes is also becoming more general, and the British-American Tobacco Co.'s trade has increased greatly.

There is a good market here for cheap lamps and lamp fixtures and the demand will increase. A native glass factory in Amoy, capitalized at \$5,000, supplies the native trade throughout south Fukien with cheap lamp chimneys.

#### **Demand for Machinery, Condensed Milk, and Canned Goods.**

The imports of machinery and fittings vary greatly from year to year, but with proper encouragement to productive enterprise, which must come with improved political conditions, there should spring up a substantial demand for machinery in the sugar, mining, paper mill, and possibly the cotton industries. These industries with the least bit of encouragement would become paying interests in this district. Already a number of small modern sugar mills have been erected here and better qualities of cane are being imported. It has been demonstrated that cotton can be advantageously produced in this district and American cotton seeds are being planted. The mining possibilities in this district are unlimited. Magnetic iron ore, graphite, coal, antimony, and lead exist here in abundance not far from tide-water. A good match factory could be established here to supply the market with a part of the large quantities of matches now imported from Japan.

American condensed milk manufacturers are losing an excellent opportunity by failing to push their Chinese trade more vigorously. Recently a British condensed milk company sent a motor launch to its Amoy representative to enable him to go up the interior waterways and properly advertise its goods. This company is doing a splendid business throughout China as a result of advertising its products in the native language and in ways that appeal to the Chinese people.

The Chinese are fond of marine products, and the abalone, found on the California coast, has gained favor with them. Increasingly large

quantities of canned goods are also being consumed. Tinned biscuits, especially the sweeter varieties, are very popular indeed. American biscuit manufacturers should put up their products in neat, small, sealed tins, and make an effort to take advantage of the many trade opportunities presented in China in this line. The same thing is true of foreign tinned jams. There is a canning factory in Amoy, financed and operated by local Chinese, which puts up and markets soya, canned pineapple, canned laichee, and all other native food products.

#### Trade in Treasure—Financial Conditions.

The movement of treasure in 1910 and 1911 is shown in the following table:

	Imports.		Exports.	
	1910	1911	1910	1911
Gold in bullion.....	\$3,041	\$16,358	\$21,104	\$2,751
Gold coins.....		2,579	6,016	10,579
Silver coins.....	2,143,573	2,421,971	701,745	807,584
Copper coins.....	108,368			

Of the silver coins imported, \$1,417,187 worth came from foreign ports and \$1,004,784 worth from native ports. The increased importations of silver were due to an increased demand for silver dollars, as native bank notes and ordinary mediums of exchange would not be accepted after the outbreak of the revolution. The currency of this port is different from that of others, as business interests use no local tael, and the unit of currency for business purposes is the silver dollar. The Hongkong & Shanghai Banking Corporation uses a theoretical unit, the so-called Spanish dollar, and the Japanese Bank uses the chopped yen as its unit. (A "chopped" coin is one which has been stamped by Chinese bankers to guarantee its value.) With these standards in use the silver dollar becomes a commodity, the price of which varies according to demand and supply. Early in the year the Hongkong & Shanghai Banking Corporation made a heavy importation of clean Hongkong dollars. The native customs bank received these in payment for customs duties but purchased chopped Mexican dollars at a discount from Foochow and deposited them at the Hongkong & Shanghai Bank, selling the clean Hongkong dollars outside at a profit. There are probably 1,000,000 silver dollars in circulation in this section of Fukien Province.

Subsidiary silver coins exchanged at \$1,051 to \$1,068 worth for 1,000 large silver dollars. Copper coins (1-cent pieces) fluctuated in exchange value from 120 to 130 pieces for one silver dollar. The lack of a fixed unit of local currency injures legitimate business badly, but naturally the banks profit by it.

There are 22 native banks in Amoy, 12 of which do a general exchange business, and 2 foreign banks. Of all these there is only one through which drafts on American and European cities can be negotiated. The native banks allow 7.2 per cent interest on fixed deposits and the foreign banks 4 per cent, but people hesitate to deposit in the native banks because of their reputation for instability. Exchange

from New York fluctuated during the year between 43½ and 45½ for demand drafts, which may be termed fairly steady and strong.

**Shipping Record for the Year—Heavy Emigration.**

During the year 1,710 vessels, of 2,127,689 tons, entered and cleared, as compared with 1,754 vessels, of 2,099,704 tons, in 1910. The total trade carried amounted to \$14,579,499, of which \$10,094,612 was carried in British ships. Four American vessels of a tonnage of 17,678 were recorded. During the year 55,799 passengers came to Amoy from abroad, the majority being Chinese emigrants returning from the southern colonies, and 114,519 passengers left the port for foreign countries, most of these also being emigrants to southern countries. This passenger traffic forms one of the chief business interests of this port. Two steamship lines are operated between this place and the Philippines to take care of this traffic and there are two large disinfecting plants to insure that passengers shall not be detained in quarantine in the Philippines. There are eight Chinese-owned steamers engaged in the passenger traffic of this port with the southern colonies and all appear to be making good returns on the capital invested.

The ease with which the native can be transported to the southern colonies has had the effect of raising wages here so that the cost of living is higher than in Foochow, from which port a comparatively small number of Chinese go abroad. There are about 300 Europeans and Americans in this district, more than half of whom are missionaries.

**American General Importing House Advisable.**

There is a good opportunity for the establishment in Amoy of a general American import house to operate in the three ports of Swatow, Amoy, and Foochow, which tap a population of twenty or thirty millions, and to cover also the island of Formosa. This firm, if staffed with two live Americans and provided with proper home connections, should be able to work up a very substantial and profitable business in this section of China. Condensed milk, flour, ginseng, patent lamps, dried and salt fish and dried shrimps, medicines, stationery, general notions, etc., most of which are now supplied through Hongkong dealers, could be sent direct to these ports through such a firm. A local general merchandise firm purchases over \$100,000 worth of merchandise abroad each year, mostly from England, but would be glad to buy from American houses at the same prices if a reliable man were here to take the orders.

---

**SWATOW.**

[By Consul C. L. L. Williams.]

An inspection of the figures of the gross and net valuation of the trade of Swatow in 1911 shows a slight decline from the high figures of 1910. This deficiency is divided between imports of foreign goods and exports to foreign countries, the coastwise trade, in spite of the revolution, showing an increase.

The apparent decline, however, is a book decline only and is due to a new standard of valuation. Under orders from Peking the customs authorities adopted the Canton values for use at this port instead of

the Shanghai values previously in use. The Canton values are possibly more accurate and are considerably lower. The duties collected, however, are almost all specific and are not affected by the alteration in the value standards used for statistical purposes, and consequently afford a better basis for comparison. For 1910 the total dues and duties collected by the Imperial Maritime Customs amounted to \$896,365 and for 1911 to \$994,121, thus indicating an actual increase in the year's trade of considerable size.

The dues collected from the native customs increased from \$23,816 in 1910 to \$25,488 in 1911. This trade, which is almost entirely junk-borne between Swatow and the Fukien and Kwangtung coast cities, is of interest as showing the extent to which Swatow acts as a distributing center.

#### Articles of Import and Export Trade.

Except for the kerosene trade with the United States, Borneo, and Sumatra and the trade with Indo-China, Siam, and the Straits Settlements, almost all the foreign trade of the port is carried on through Hongkong. The principal articles of import and export in 1910 and 1911 through the Imperial Maritime Customs were as follows:

Articles.	1910	1911	Articles.	1910	1911

**Trade through Native Customs.**

Through the native customs the principal articles imported were: Salt fish, 3,348 tons; medicines, \$6,846; molasses, 1,018 tons; brown sugar, 1,697 tons; and tea-seed cake, 930 tons. The principal exports were: Paper fans, 253,120; potato flour, 2,031 tons; paper, 1,980 tons; timber, softwood, 28,356 pieces; wood poles, 9,345 pieces; shoes, 7,440 pairs; and articles of foreign produce, \$1,085,720.

**Summary of Year's Trade.**

The Imperial Maritime Customs summary of the year's trade as compared with 1910 is as follows (exchange value at 64 cents for both years):

	1910	1911
<b>Imports of foreign goods:</b>		
From foreign countries and Hongkong.....	\$12,249,234	\$10,143,373
From Chinese ports.....	278,852	687,985
<b>Total foreign imports.....</b>	<b>12,528,086</b>	<b>10,831,358</b>
<b>Reexported.....</b>	<b>149,799</b>	<b>387,129</b>
<b>Total net foreign imports.....</b>	<b>12,378,287</b>	<b>10,444,229</b>
<b>Imports of native produce.....</b>	<b>12,829,666</b>	<b>13,429,446</b>
<b>Reexports.....</b>	<b>866,254</b>	<b>772,551</b>
<b>Total net native imports.....</b>	<b>11,963,414</b>	<b>12,656,895</b>
<b>Exports of native produce of local origin:</b>		
To foreign countries.....	4,629,050	4,276,000
To Chinese ports.....	4,582,400	5,528,923
<b>Total exports native produce.....</b>	<b>9,211,450</b>	<b>9,804,923</b>
<b>Gross value of trade of port.....</b>	<b>34,569,204</b>	<b>34,065,726</b>
<b>Net value of trade of port.....</b>	<b>33,550,151</b>	<b>32,906,046</b>

**Flour and Ginseng Imports.**

The greatly increased imports of foreign flour, which is practically all American, were due to the shortage of rice caused by the floods in China and unseasonable weather in other rice-producing countries, and to the decrease in the imports of Shanghai mill flour. A considerable part of the ginseng imported is American, though just how much is impossible to say, as the customs do not indicate country of origin. Ginseng is retailed in Swatow at \$20, \$40, and \$60 Mexican per catty (1½ pounds), depending on quality, which is determined by the size and shape of the roots, those of first quality weighing about 1 ounce each. Good roots must also be well corrugated, smooth, and succulent. Very little wild ginseng, properly speaking, is imported, the prices quoted being for ginseng found wild and transplanted and cultivated, most of this coming from America. The great wholesale ginseng market for South China is Hongkong, but one or two local firms are endeavoring to work up a direct trade with America. One dealer says that he has done about \$5,000 worth of business during the year as a result of assistance given by this office in effecting trade connections.

**Features of Kerosene Trade.**

Kerosene is the most important American product imported into Swatow. The trade in 1911 was marked by the entrance into this district of the Texas Oil Co., with a trial shipment of oil, packed in

wooden cases of two 5-gallon cans, and by the withdrawal of the Rangoon Refinery Co. Most of the trade remains fairly evenly divided between the Standard Oil Co. and the Asiatic Petroleum Co. (Ltd.), a powerful English organization, drawing its supplies from Borneo and Sumatra.

While imports of American oil were above the average and imports of other oils were normal, the whole trade was seriously affected during the last three months of the year by the revolutionary disturbances. The close of the year found importers with stocks in storage much above normal, and this condition still obtains at this writing (Mar. 1, 1912). Until the transportation of goods from one town to another is made safe there is little chance of any revival of the oil trade. Imports of American kerosene into Swatow in 1911 amounted to 4,443,978 gallons, from Borneo 614,799 gallons, and from Sumatra 3,064,626 gallons.

#### **Other Articles—Foreign Clothing.**

Among unenumerated sundries not shown in the table were fancy buttons to the number of 13,149 gross. These are largely used by the Chinese on their native dress and are usually of the size of waist-coat buttons. Brass and colored-glass buttons are also popular. Cement, which is largely used for building purposes, was imported to the amount of 2,067 tons.

Foreign clothing to the value of \$82,500, not including leather and rubber goods, was imported. As a result of the revolution a large number of Chinese have adopted foreign dress, and there should be a good demand for ready-made clothing of the right type, if it can be placed on the market at a sufficiently low price. Materials must be of light weight, and gray, green, and blue striped flannel would perhaps suit the market best. High quality is not necessary and woolen and cotton mixtures are quite satisfactory. Two local merchants inform me that they can sell three-piece suits of "medium" quality at \$5 to \$6 per suit, and suits of "good" quality at \$8.50. The terms "medium" and "good" are used with local significance and would about correspond to "cheap" and "medium cheap" in the United States. It should be remembered that the Chinese as a race are considerably smaller than the average American, and that small sizes would be in the greatest demand.

Clothing sundries in demand include woolen and cotton mixture sweaters in dark red, green, and white; rubber collars, double, in small sizes; made-up ties; and cotton underclothing and socks. There is an extensive market for the two last-named articles, which is partially supplied by goods-manufactured locally and in Hongkong with American machinery. This office will be glad to supply details as to prices, styles, and packing, and to furnish samples if necessary, to interested parties.

#### **Foreign Boots and Shoes Extensively Used—Paper Imports.**

Some 3,600 pairs of boots and shoes were imported during the year. These are even more extensively used by the local Chinese than articles of foreign clothing. The demand at present is met very largely by native-made shoes of foreign pattern but Chinese leather. There should be a good market for imported shoes if the prices are right, as the Chinese leather is very inferior. Low shoes, or simply "shoes," as

they are known in China, should not retail at more than \$4.50 Mexican (about \$1.95 U. S. currency) per pair, and high shoes or "boots" at not more than \$7.50 Mexican (about \$3.26 U. S. currency) per pair. Shoes made of native leather sell at about \$2.50 to \$3 Mexican per pair (\$1.10 to \$1.30). Some inferior American "boots"—which I am assured were made of paper—were placed on the market here at \$3 Mexican per pair; they were naturally not satisfactory, and were a bad advertisement for the American article. Tan leather is preferred to black; lace shoes are usually seen, although elastic side "boots" are fairly common. Boots are almost always laced, buttons not being in favor.

Paper to the value of \$67,584, representing 763 tons, was imported during 1911. This was chiefly printing paper, and was brought from Japan. Germany formerly had the monopoly of this trade.

**Orange and Sugar Crops Normal—Drawn Work.**

The orange crop on the trees was about normal, but had it not been for the typhoon in October, there would have been a much larger yield. This crop ripens in December and January, but disorders interfered with the picking of the fruit. Unripe, ripe, and overripe fruit were all picked at the same time about the beginning of the year, and a large percentage of the crop had been touched as a result of the lack of attention. Untouched "coolie" (close-skinned) oranges for export brought about \$1 to \$1.30 per 100 pounds, and touched oranges for local consumption about half that price. The crop of "mandarin" (loose-skinned) oranges was not picked in time, and in consequence a large part of it rotted on the trees and was worthless. By the end of January these oranges reached the high price of \$3.50 per 100 pounds as a result of the shortage. These are not suitable for export abroad, as they do not pack well, but are in great demand by the Chinese in their New Year's festivities.

The year's sugar crop was normal. The Yangtze Valley market was closed on account of the troubles there, but an unexpected demand from Hongkong for sugar for refining purposes saved the Swatow dealers. Considerable quantities were placed at about \$2.30 per 100 pounds, but the market still remains slack, dealers having been unable to clear 1910 stocks. Local prices per 100 pounds in December, 1911, were as follows: Refined: No. 1, \$4.37; No. 2, \$4.14 to \$4.18; No. 3, \$3.83 to \$3.88; No. 4, \$3.27; raw, \$3.04.

For crude sugar at producing points about 65 to 69 cents per pot of 46 to 53 pounds was paid, being a decline of 22 cents from 1910 prices.

There was a good demand for drawn work throughout the year, especially marked toward its close. This was due, it is said, not so much to increased consumption as to decreased production, resulting from workers leaving the city factories on account of the troubles. The exports of this product are not shown in the published customs returns, but according to manufacturers about \$13,000 worth was shipped to Chinese ports and about \$71,600 worth exported altogether. Much of this product is shipped by mail in small parcels.

**Railway Traffic—Construction of Waterworks.**

The Swatow-Chaochowfu Railway carried about 700,000 passengers during the year, yielding an income of \$86,800, and carried some 16,000 tons of freight yielding an income of about \$3,200.

Owing to a loss of about \$15,000 caused by the flood of last August no dividend was declared.

The construction of the waterworks is progressing rapidly. The filter beds and power houses at the intake station at Ampo have been completed and the machinery will be installed shortly. Some trouble has been experienced with the walls of the filter beds, due to settling, there being no bottom for building purposes near Swatow. The machinery at the intake station will consist of two sets of Worthington pumps, in each set one intake pump with a capacity of 1,350 gallons per minute, and one service pump with a capacity of 1,000 gallons per minute. There will be a service reservoir of 800,000 gallons capacity at Ampo and a tower in Swatow having a capacity of 150,000 gallons. This tower is of steel and is built on a floating concrete basis. Street mains have been laid through all the principal thoroughfares, and if it were not for the difficulty of acquiring certain land necessary to the completion of the work, water could be turned on in the street mains by October next. Only British machinery and materials are being used.

There is talk of the extension of the plant of the Swatow-Kaiming electric light works to supply the foreign residences at Kakchih, across the harbor from Swatow. If the plan materializes the new plant will probably consist of motor-driven dynamos and will be required to furnish current for about 1,000 lamps.

#### **Trade in Firearms and Motor Launches.**

During the revolution large quantities of arms and ammunition were sold, and it is possible that some market still exists for them. Generally speaking, Canton or Hongkong would be the best place to secure orders. No goods of this kind can be imported without special permission, which in this case should be secured from the military governor of Canton.

Three commercial motor launches were purchased by local Chinese during the year and were placed in operation early in 1912. Two of them, at least, and possibly the third, are proving satisfactory. It is likely that there will be a demand for more of these boats, and in order to obtain orders trade relations should be established with Hongkong shipwrights.

---

#### **CHEFOO.**

(From Consul John Fowler.)

The trade of Chefoo in 1911 showed a marked decline over the previous year, although that of Shantung Province increased. This is due to the fact that Tsingtau, with every modern port convenience, has absorbed both the interior and the littoral trade of Shantung, and the Japanese port of Dairen has taken the place of Chefoo as the distributing center of Manchuria.

The port of Chefoo is naturally one of the best in Asia, but no improvements or facilities in the way of jetties, docks, or landing stages have ever been made with the exception of a small stone jetty for the landing of passengers. For 50 years steamers have thrown their ashes and refuse over the side and no attempts have ever been made to deepen the anchorage or remove dangers, and the tide is not strong enough to scour. In the winter stormy gales to some extent hamper the handling of cargo. The trade of Chefoo

is therefore confined to the limited territory adjacent to the port. If the city is connected with the interior by railways, and if proper docks and landing facilities are constructed, it may regain its former prestige, but this is doubtful.

#### **Plague, Floods, and Revolution Keep Down Trade.**

The trade year of 1911 began well, but late in February pneumonic plague appeared and spread all over the district, causing in six weeks over 4,000 deaths. Naturally the people ceased work, all factories closed, and ships no longer entered the port. With the warm weather of spring the disease disappeared, but the trade never really recovered. Foreigners were afraid of anything coming from Chefoo, and the silk trade was nearly annihilated.

The summer was cold and unusually dry. Crops near Chefoo were fairly good, but in the south they were a failure on account of the floods, and it is estimated that over 100,000 persons were made destitute. In the fall the effects of the political revolt were keenly felt and failure followed failure until one of the leading native firms succumbed, involving many enterprises. Chefoo became the base of the military operations for North China, and although no serious trouble occurred in the city, the neighboring country was the scene of constant conflicts. Thus the year, beginning with the plague and ending with revolt, afforded everything necessary to stop trade.

#### **Railway and Telegraph Service—Shantung Cotton.**

The Pukow-Tientsin Railway, running across the Province from Pukow on the Yangtze River opposite Nanking, through Tsinan to Tientsin, was completed, but almost immediately it was seized by the military forces. Recently the telegraphic service here announced that deferred telegrams fulfilling certain conditions would be accepted for transmission at half the ordinary rates to European and American countries.

The following article dealing with Shantung cotton is taken from the China Tribune:

Cotton brought to Tientsin amounts to about 40 per cent of the entire product of Shantung. Transactions are invariably carried on through the native wholesale dealers and all attempts of foreign firms to buy direct from native growers have so far been without avail. Foreign buyers are thus subjected to the practices usually attendant on these transactions of watering cotton or mixing with it lumps of earth or bits of rope in order to increase its weight.

Ginned cotton is usually packed in bales of 55 to 85 cattiees (73 to 113 pounds), including the tare, which amounts to 3½ per cent. Transportation from Tsinan to Tsingtau, including charges for loading on a steamer, costs about 75 cents silver per bale. The difference between the prices of the grower and the wholesale dealer in Tsinan is about 7 to 10 per cent of the current prices, of which about 2 per cent is freight charges to Tsinan and the balance the commission of the small and large brokers and the wholesale merchant.

Only a small portion of the Shantung cotton exported from Tsingtau is sent to Japan, most of it going to Shanghai where it is consumed in the spinning mills. The freight from Tsingtau to Shanghai is \$1 Mexican per 100 kilos (220 pounds). Large quantities of Shantung cotton, especially the Lintsing product, have been exported from Tientsin to Great Britain and Germany in the last year or two. Tientsin merchants buy cotton much cheaper than foreign buyers at Tsinan, having larger capital, more experience and more painstaking methods of buying. They send their agents to the country during the summer and these men after looking at the plants contract for purchases, paying a deposit to the growers.

At various cotton-producing districts in Shantung cotton gins of Japanese make are used. These cost only about \$40 apiece, but are easily damaged and do not take away all the seed. German machinery costs from 300 to 400 marks (\$71.40 to \$95.20), but its durability and thoroughness put it far above the Japanese machinery.

## Articles Entering Into Foreign Trade.

The principal articles of import and export through the Imperial Maritime Customs in 1910 and 1911 were as follows:

Articles.	1910	1911	Articles.	1910	1911
<b>IMPORTS.</b>			<b>IMPORTS—continued.</b>		
Opium.....pounds	36,066	100,240	Foreign sundries—Contd.		
Cotton goods:			Seaweed, long, pounds	1,380,000	4,904,800
Shirts, plain gray			Sugar—		
American, pieces	7,335	6,413	Brown.....do.	10,644,206	7,616,000

			Walnuts.....do.	666,066	320,333

## Declared Exports to United States.

The United States sent \$624,263 worth of kerosene to Chefoo in 1911, as against \$399,934 worth in 1910. Declared exports to the United States in 1910 and 1911 were as follows:

Articles.	1910	1911	Articles.	1910	1911
Beans.....		86	Pine nuts.....	850	
Bean oil.....	84,000		Silk.....	106,000	329,274
Eggs.....	15		Vermicelli.....		43
Groundnuts.....	418	6,780	Walnuts.....	17,669	7,266
Honey.....		12	Total.....	126,771	43,600
Lace.....	84				
Personal effects.....		2,307			

Declared exports from Chefoo to Hawaii consisted of \$656 worth of silk, compared with \$587 worth in 1910. There were no declared exports to the Philippines in 1911.

Six American ships, with a tonnage of 4,222, entered in 1911, the total number being 3,896, of 3,183,350 tons. British, Japanese, and Chinese vessels predominated.

#### Summary of Two Years' Trade.

A summary of the trade of Chefoo in 1910 and 1911, according to the Imperial Maritime Customs, is given in the following table, conversions having been made at the rate of 65.25 cents per haikwan tael for 1910 and 65.3 cents for 1911:

	1910	1911
<b>Imports of foreign goods:</b>		
From foreign countries and Hongkong.....	\$3,447,133	\$3,341,240
From Chinese ports.....	4,298,249	3,831,075
Total foreign imports.....	7,745,382	7,172,315
<b>Reexported to foreign countries and Hongkong.....</b>	<b>1,168,664</b>	<b>819,631</b>
Reexported to Chinese ports.....	1,324,867	1,014,090
Total reexports.....	2,493,531	1,833,721
Total net foreign imports.....	5,251,851	5,338,594
<b>Imports of native produce.....</b>	<b>6,340,862</b>	<b>7,297,667</b>
Reexports to foreign countries.....	588,735	694,633
Reexports to Chinese ports.....	919,015	1,066,548
Total native reexports.....	1,508,350	1,761,181
Total net native imports.....	4,838,512	5,536,486
<b>Exports of native produce of local origin:</b>		
To foreign countries.....	2,286,430	2,713,415
To Chinese ports.....	7,325,955	6,374,070
Total exports native produce.....	9,612,385	9,087,485
Gross value of trade of port.....	23,704,629	23,557,467
Net value of trade of port.....	19,702,748	19,962,565

### HAWAIIAN BUSINESS NOTES.

[From the Honolulu Bulletin.]

**Building operations** in Honolulu are active throughout the city and suburbs.

**Wire fence.**—A contractor has finished building 4,000 feet of unclimbable woven-wire fence, mostly 10 feet high, for the Government on Quarantine Island.

**Hotel proposed.**—The syndicate owning the Fairmont and St. Francis Hotels at San Francisco are considering the erection of palatial hotels in Honolulu and at the Volcano.

**New warehouse.**—Bids are being called for a one-story reenforced concrete warehouse for the California Feed Co., Honolulu, with 12,000 square feet floor space and some offices; H. L. Kerr is architect.

**Cheap ice.**—Hawaii furnishes the Government with the cheapest ice that is supplied to the Army. The new local contract for the coming fiscal year is 15 cents per 100 pounds, the monthly consumption being 450,000 pounds. In Chicago the Army pays 25 cents, and there are posts where it goes as high as 75 cents and \$1.

**New ships.**—Secretary Wood of the promotion committee states that there are plans by both the Matson concern and the Pacific Mail Co. for building a number of new steamers for the Pacific trade. The Pacific Mail is prepared to spend \$12,000,000 on new vessels, of which there will be four. The plans for the new ships are all finished and the work of construction will soon commence. The Matson Co. will build one massive steamship to be placed in the local trade. Secretary Wood states that the figures that were placed before him while he was on the coast led him to believe that the tourist trade to Hawaii this coming season will increase 100 per cent.

**GERMAN HAIR-NET INDUSTRY.**

[From Consul Milo A. Jewett, Kehl.]

Hair nets, properly speaking, are not simply nets for the hair; they are nets made of hair. Strassburg, Germany, and Vienna, Austria, are the only cities where hair nets are sold in important amounts.

Years ago Strassburg was the greater center of this trade; but since then the Alsatian peasants have devoted more time to the cultivation of their fields and vineyards and have engaged in other industries, while the peasants of Bohemia still continue to work at hair-net making because their rugged mountain country furnishes few opportunities for more lucrative employment. It now appears that rather more hair nets are made in Austria than in Alsace-Lorraine, but Strassburg buys and sells many of the Austrian nets.

It is estimated that Strassburg sells annually about 12,000,000 hair nets. During the last year trade has declined owing to the change in the style of coiffure, and also on account of the increased use of cheaper nets made of waste silk.

**An "Hereditary" Industry—Wages.**

The hair nets are made almost wholly in the homes of Alsatian and Austrian peasants. Weaving the nets is a work requiring manual dexterity that can be acquired successfully only in youth, when the fingers are supple and the eyesight is good. This industry and the peculiar skill required to net hair has become in part hereditary. The children begin first to tie the hairs together, end to end, to make one long hair. Then, without any implements except a round piece of wood about 6 inches long and half an inch in diameter and a needle, the older girls and women, and sometimes the men also, weave the nets. Each mesh is knotted in much the same way that fish nets or hammocks are made, only, of course, tying a single hair is a more delicate and difficult task than tying a string.

The work is poorly paid. The rate is unusually low at present—19 cents a dozen nets of ordinary color. That means that a worker must tie about 12,000 knots to earn 19 cents, besides knotting the hair together, adjusting, counting, folding, and packing the nets. To make a dozen nets is a day's work of 10 or 12 hours. When the demand is greater, the pay increases more or less in proportion. More is paid for making gray nets than for the ordinary colors. The latter are made with a single hair; but in gray nets one white hair and one colored hair, black, brown, or auburn, are loosely twisted together. These nets, accordingly, require twice as much hair and their weaving is slower and more difficult work.

**Chinese Hair Used—Styles of Nets.**

Practically all the hair used in making hair nets comes from China. No other hair possesses just the right degree of coarseness and resilience to give that peculiar elastic spring to the mesh that a good hair net requires. The hair of the northern blond races is too fine and soft, and consequently utterly useless for this purpose. The black hair of the southern races, Italian and Spanish, is a little coarser and more suitable. Japanese hair is too stiff and coarse. The hair of the yak has been tried without much success.

Most all the Chinese hair used here is prepared at Paris. The preparation of the hair for hair nets is a complicated and delicate process

in which only a few persons of long experience succeed. It is a special and more or less secret process which consists in cleaning the hair, bleaching it, washing out the bleach, and then dyeing it to just the right colors and shades that style and the market demand.

The nets of Strassburg are made in two general forms—the circular, self-adjusting cap nets and the flat form. Each net is shipped in a separate envelope generally bearing some trade or firm name.

[The names of the principal Strassburg manufacturers of hair nets may be secured from the Bureau of Manufactures. A review of the Austrian human-hair industry was published in Daily Consular and Trade Reports on Jan. 15, 1910.]

---

### TRINIDAD NOTES.

[From Consul Franklin D. Hale, Port of Spain.]

#### American Taxicabs—New Steamers.

The West India Engineering & Motor Supply Co. has recently imported from New York four taxicabs for purposes of hire in Port of Spain and vicinity.

Since the inauguration last year of the Seeborg Line of steamships plying between Mobile (Ala.) and the Windward Islands and Trinidad, the business has so developed as to make it necessary to put additional vessels on this run, the latest acquisition being the chartered German steamship *Hispania* of 1,574 tons.

The local government has ordered through the London Crown agents a new 14½-knot coasting steamer for use on the southern route in connection with the railway at San Fernando. The development in the coconut industry in the southern district and the prospective growth of the oil industry necessitate a better steamship service.

#### Satisfactory Progress of Railway Extensions.

The chief engineer on the railway extensions reports satisfactory progress. Of the 16½ miles of earthwork on the Siparia branch 9 miles are now near completion, while on the Rio Clara route 10 of the 13 miles are about ready for laying the rails. The ironwork for all the bridges has been contracted for in England, and shipments will be made as fast as possible. The exact model of engine to be used will not be determined until the constructed bridges have been tested to see what weight they will safely sustain.

As a part of the general plan, the necessary sea wall at San Fernando and the station at Picton are in course of construction. This being entirely governmental work, all materials, etc., so far as possible, are procured from England through the Crown agents.

It is reported that there is plenty of labor, about 1,200 men and women being employed on the different divisions. The extreme drought prevailing for so many weeks in the districts where this work is being carried on has necessitated sending water from Port of Spain daily by train to meet the needs of the laborers.

---

*Compulsory wireless installation.*—The Uruguayan consulate general at New York advises that the law making compulsory the installation of wireless apparatus on board vessels arriving at or leaving the ports of Uruguay (mention of which was made in Daily Consular and Trade Reports on Mar. 7) became effective June 11.

## BRITISH COTTON GOODS EXPORT GAINS.

The enormous sales abroad of Manchester yarns and cloth, which exceeded half a billion dollars last year, have made further gains this year. Up to May 1, cotton-yarn shipments were 83½ million pounds, against 76½ million pounds in the first four months of 1911 and 62½ million pounds in the same period of 1910. The best purchasers, for the periods above mentioned, were as follows:

Countries.	1910	1911	1912	Countries.	1910	1911	1912
	Million pounds.	Million pounds.	Million pounds.		Million pounds.	Million pounds.	Million pounds.
British India.....	8.4	12.5	13.7	Roumania.....	1.6	3.1	3.8

Exports of British piece goods for the first four months of this year reached 2½ billion yards. Especially noteworthy are the large sales to China, with large increases in bleached, printed, and dyed cloth, and the steady development of the English cotton-goods trade in the Balkan States and the Levant generally. The Bureau of Manufactures at Washington has been making special investigations of the Near Eastern textile markets, and several publications relating thereto, with samples, prices, etc., are available to American manufacturers and their agents.

### BETTER PARCEL POST SERVICE TO CHILE.

In response to the recommendation of the American consulate at Valparaiso, the United States Post Office Department has arranged with the postal administration of Chile for the making up and dispatch of parcel post mails from this country addressed to the office of Valparaiso, these mails to contain parcels destined for the Provinces of Aconcagua, Chiloe, Llanquihue, Magallanes, Valdivia, and Valparaiso.

Conditions as they existed before the establishment of the direct exchange between the United States and Valparaiso are set forth in the following report by Vice Consul Charles F. Baker, upon which the action of the Post Office Department was based:

According to a special agreement, dated December 1, 1908, on this subject with the Chilean Government, Iquique and Santiago are the only two points in the whole of the country that enjoy direct exchange of parcels; that is, all parcel post packages arriving from the United States for Valparaiso must go first to Santiago, some 115 miles inland, to be entered, etc., and then returned to this port for delivery; while goods arriving in the same manner from any other part of the world and destined for Valparaiso are entered here.

Owing to the roundabout methods described, merchandise from the United States for this port suffers a delay of 15 days in delivery (the very thing merchants hope to avoid by the use of the parcel post), while German, French, or English packages are in the hands of the consignee within three days at most from the date of arrival. The loss sustained by packages after their arrival at Santiago and before they reach the consignee in Valparaiso is also a matter that gives rise to an endless amount of complaint.

#### Opportunity to Increase Mail Order Business.

Given equal advantages with other markets, it would seem that American interests should be able to do a good parcel post business with Chile in ladies' and children's furnishings (excepting hats and the finer woolens and silks) men's furnishings, and shoes of all kinds. There is also a good opportunity for the smaller miscellaneous lines in which the American market abounds; articles which are not to be found in stock here because the demand is not general enough.

These things could be brought to the notice of the consumer by advertising, facilities for which are fairly good in Chile, and the rates are very reasonable.

Roughly speaking, there has been an annual increase of about 40 per cent in the parcel-post business of Valparaiso since 1908, the number of packages handled for that year being 18,917; for 1909, 27,687; for 1910, 38,708, and for 1911 about 50,000.

The volume of the parcel-post business for the entire country for the five years ended in 1910 is shown in the following table, the values being given in United States currency:

Countries.	1906	1907	1908	1909	1910
France.....	\$141,152	\$154,223	\$556,480	\$326,001	\$676,564
Germany.....	138,070	113,518	68,098	276,002	329,320
Great Britain.....	20,440	32,515	132,089	128,154	86,322
United States.....	57,327	23,244	86,666	99,344	38,975
Other countries.....	49,241	42,748	147,785	113,509	224,754
Total.....	406,230	366,248	989,718	944,300	1,285,935

## REVIEW OF THE SWISS WATCH INDUSTRY.

[From Consul General R. E. Mansfield, Zurich.]

The year 1911 was one of unusual activity and general prosperity in the watch industry of Switzerland. The factories were all running continuously and to their full capacity. There was a good demand for the Swiss product and at prices which returned better profits than at any time in recent years. The export figures for 1911 exceeded those of any year in the history of the industry, the total values surpassing those of 1906, when the watch trade reached its previous highest level.

Notwithstanding the tariff duties on watch exports to the United States, the export values there last year increased \$109,661 as compared with 1910, and orders placed by American importers with Swiss manufacturers during the latter part of the year, for 1912 delivery, indicate that the trade will be greatly augmented this year.

Of the total increase in value of watch exports for last year, as compared with the previous 12 months, amounting to \$3,282,874, Great Britain, Germany, and Austria contributed the largest shares, in the order named. The trade with Argentina and Brazil also shows considerable increase, mostly in cheaper grades of nickel, gun-metal, and silver watches, which are purchased extensively by people living in the agricultural districts. South America is regarded by the Swiss manufacturers as a promising market for their products. The only unfavorable feature of the trade was the decrease in exports to Morocco, caused by political disturbances, which affected the business with both the natives and French in that territory.

The majority of factories have sufficient orders in hand to guarantee steady employment and profitable business for the present year, and some of the manufacturers are enlarging their plants for increasing the output to meet the demand for their products. The general outlook is very satisfactory, and the industry has apparently fully recovered from the serious depression through which it passed a few years ago.

The number and value of watches and parts thereof exported during the year were as follows:

Articles.	Number.	Value.
Watch movements, finished.....	933,145	\$1,404,433
Watch cases, nickel, unfinished.....	247,230	31,866
Watch cases, silver, unfinished.....	32,415	11,370
Watch cases, gold, unfinished.....	1,286	5,811
Watch cases, nickel, finished.....	2,341,044	563,432
Watch cases, silver, finished.....	276,211	260,312
Watch cases, gold, finished.....	62,390	824,527
Watches, complete, nickel.....	6,976,655	7,073,613
Watches, complete, silver.....	3,031,048	6,827,623
Watches, complete, gold.....	1,022,948	11,582,276
Chronometers, pedometers, etc.....	52,588	447,735
Other kinds of watches.....	61,237	349,842
Clocks and parts thereof.....	30	11,281
Clocks for public buildings.....	13	1,259
Clocks, antique.....	226	51,761
Alarm clocks.....	4	2,018
Unfinished parts of watches.....	612	452,442
Miscellaneous parts.....	1,591	1,764,744
Total for 1911.....	15,051,590	31,657,165
Increase over 1910.....	2,065,424	3,282,874

The number of finished watches exported in 1910 and 1911 was: 1910—nickel 5,845,004, silver 2,682,469, gold 943,222, total 9,470,695;

1911—nickel 6,976,655, silver 3,031,048, gold 1,022,948, total 11,030,651; increase over 1910, 1,559,916. The export value of finished watches last year was \$25,483,412, an increase of \$3,450,107 over 1910. The number of finished watch movements exported in 1911 was 933,145 movements, valued at \$1,404,433, an increase of 59,613 movements, valued at \$53,856.

The production of gold and silver watch cases and various articles of jewelry made of the same metals is practically under Federal control. The stamp of Government approval is placed upon articles of certain standards for export trade, thereby guaranteeing their merit and quality. The number of watch cases bearing the Government stamp was larger in 1911 than for any previous year.

### RESOURCES OF UNGAVA OR LABRADOR.

[From the Canadian press.]

The extension of Quebec Province by the addition of Ungava (the Labrador Peninsula, not including Newfoundland's coastal strip) and the alleged gold discoveries there have brought into prominence a territory about which little is generally known. Senator Edwards some years ago sent skilled men to explore Ungava for timber limits. He told a Senate committee that the information given to the committee cost him about \$30,000 to learn. The senator's firm explored down the Albany River and to Hudson Bay, the Hamilton Inlet district, and all the rivers from the mouth of the St. Lawrence to the head of Anticosti Island. Agricultural prospects are limited. Vegetation is rapid, but agriculture is not likely to be a commercial success.

Back some distance from the Labrador coast and in the immediate valleys of all the streams in that district the timber is large; also in the district around Hamilton Inlet, around Melville Bay, up the Hamilton River, in the valleys of all the rivers running into Hamilton Inlet, and also in the valleys of the rivers extending from Chateau Bay to the head of the island of Anticosti. The timber within these areas is large and good, but the strips do not extend back from the streams for any distance. From half a mile to a mile on each side of the streams would be the extreme.

On the mountains is a vast quantity of perfect timber. The objection to it was that it is scrubby. However, the time will come, if that timber is preserved, when it will be very valuable.

Senator Edwards holds that the Province of Quebec, in this Hamilton River country, has one of the best timber districts on the North American Continent if only preserved, but burning is going on to a tremendous extent, the work of the few settlers there. Valuable areas of timber are being burned. Settlers simply light fires in the summer time to dry the timber for their winter use. These fires extend over vast areas, and enormous portions of the country have been burned. The senator explained that he had taken 500 miles of limits there and allowed them to expire, simply because of the regulations.

On the mountains around Hamilton Inlet there is an enormous quantity of pulp wood. Mr. Edwards said he did not know any place where there is a greater area of pulp wood than on the Hamilton Inlet, around Melville Bay, and for a certain distance into the interior. On the immediate coast of the Atlantic, from Hamilton Inlet to the St. Lawrence, there is no timber.

Senator Edwards described the Grand Falls at Hamilton Inlet as "one of the best water powers in the known world." It has an enormous head—he did not know exactly what. It has a large and never-failing water supply, and from the fact that vessels can get in there, and that there is a large area of pulp-wood country, the district is valuable.

It is possible for shipping to get into Hamilton Inlet for a long period each year. One of the advantages of the territory is its nearness to the British market, it being only a ferry across the Atlantic, as Senator Edwards says.

*Tree cotton in Venezuela.*—According to Consul Herbert R. Wright, of Puerto Cabello, it is said that a cotton syndicate will soon be established at San Carlos, in the State of Zamora. The consul states that 100 laborers are at work clearing the land, which will be devoted exclusively to tree cotton.

**ROPE HORSESHOES IN GERMANY.**

[From Consular Assistant Louis G. Dreyfus, Jr., Berlin.]

Owing to the rapid increase in the mileage of streets paved with asphalt and wood blocks and to the congestion of traffic in the large cities it was found necessary to afford greater safety for horses, to prevent their slipping and to enable them to come to a quick stop. This has been attained by fitting them with "rope" horseshoes. These shoes were first manufactured some 25 years ago, but it is only during the last decade that the industry has grown to large proportions.

Various forms and shapes of shoes are used. Some are open at the back, like an ordinary horseshoe. Others are closed; and very often, besides being closed, there is a bridge or crosspiece joining the two sides. When this is the case the bridge is constructed like the rest of the shoe, inclosing a tarred rope. There are usually eight nail holes in each shoe; and in order to strengthen the bottom, and especially to make the nail holes more secure, the walls of the groove are sometimes reenforced by braces. The space in the center of the shoe is often covered over with various kinds of inserts to protect the frog from injury. The latest novelty, which has been adopted by the royal stables, is the insertion at the back of the shoe of a block of wood into which stiff bristles have been driven. This is an additional preventive against slipping. When the ground is covered with snow, a special ice plate is inserted in its stead.

It is customary to use special nails with long heads in attaching the shoes to the hoof. When the long-headed nails are used, it is possible to drive them in and to extract them without taking out the rope. These nails, which are driven between the outer side of the groove and the tarred rope, also help to hold in the rope. The tarred rope wears down simultaneously with the rest of the shoe, and it is only on rare occasions that the rope must be withdrawn and new inserted. This change can be made without removing the shoe. The average life of a rope horseshoe is 6 to 8 weeks.

**Advantages and Prices.**

The advantages and disadvantages of the rope shoes can be summarized as follows: Advantages—They are light and comfortable for the horse; they help to prevent slipping; they break the concussion and deaden the sound of the hoof. Disadvantages—The driving of the nails requires more care; the blacksmith must have in stock a larger quantity of shoes of various shapes and sizes. Great care has to be taken in the preparation of rope horseshoes not to overheat the iron nor to hammer it when too cold, otherwise it will crack on the anvil.

In addition to the plain tarred rope horseshoes there are shoes in which rope interwoven with wire, wood, rubber, copper, wirework, rush, etc., is used. These are heavier, somewhat more expensive, and less practical than the plain rope shoes, and therefore have not become so well established.

The sale of rope horseshoes in Germany is regulated by the Deutsches Tauhuiseisen Syndikat, with headquarters in Berlin. This syndicate, which is composed of the eight principal manufacturers in Germany, was formed in July, 1911, to maintain a uniform price for rope horse-

shoes throughout the Empire. The individual firms in the syndicate are not in any way prevented from quoting different export prices, and it is for this reason that the rope shoes are sold in Germany for 34 marks (\$8.09) per 100 kilos (220.46 pounds) f. o. b. Hamburg in bundles of 20 shoes, unpacked, while the syndicate price is 38.50 marks (\$9.16) per 100 kilos.

There are no firms manufacturing rope horseshoes in this district, but, as mentioned above, Berlin is the seat of the syndicate controlling the industry and some of the large manufacturers have local agencies.

[From Consul Robert J. Thompson, Hanover.]

#### **One Factory in Hanover.**

In the Hanover consular district there is but one small factory making horseshoes with rope filling. Horseshoes of the ordinary kind are sold at wholesale by this firm at \$5.50 per 100 kilos (220.46 pounds). The horseshoes with rope filling are sold for \$11.25 per 100 kilos, ordinary and large size, and \$12.50 per 100 kilos for the smaller sizes.

Horseshoes with rope filling have been in use in Germany very generally for the last 15 years, the necessity for their introduction having arisen with the substitution of asphalt paving for the old Belgian blocks, and they are now considered indispensable.

[From Vice Consul Warren E. Schutt, Kehl.]

#### **Practically No Sales in Kehl.**

The official veterinarian of the Province of Alsace-Lorraine has informed this consulate that rope horseshoes were once introduced into the district, but that horse owners and farriers found them unsuitable for use here. Consequently attempts to popularize them have been discontinued and at present sales are practically nil.

[The foregoing and reports received from other consular officers throughout Germany were accompanied by sample horseshoes, illustrated circulars in German, or lists of manufacturers and dealers. These are obtainable, upon application, from the Bureau of Manufactures.]

[From Consul George Nicholas Ifft, Nuremberg.]

#### **Their Growing Use in Nuremberg.**

Rope horseshoes are coming into general use all over Germany, but especially in the large cities, where there is much asphalt pavement.

Their primary purpose is to prevent slipping during icy or wet weather, but they also find favor from the fact that the rope cushion protects the horses' hoofs on the stone-block or cobble pavements. Practically all smiths here are prepared to fit these horseshoes on demand.

Rope horseshoes are manufactured both from forged iron (pressed steel plate) and cast iron. The first are said to be the more durable and are manufactured only by a Nuremberg firm which owns the patents covering the same. They are made in several forms—light for riding horses and heavy for draft animals. The shoes are very simple and consist of an ordinary horseshoe form with a deep groove on the under surface into which a section of ordinary rope is fitted. This groove is so constructed that, once forced into the groove, the rope remains there without further fastening. The groove is made

for rope about three-fourths of an inch in thickness, and to render the rope more durable it sometimes has a steel wire running through its center.

The use of rope horseshoes in Nuremberg is not large, as the street grades are frequently so steep as to make the use of asphalt for pavement impossible; but the demand is growing. Aside from preventing slipping, the rope cushion lessens the shock of the pressure on the horseshoe nails, which in the ordinary shoe is considerable after the shoe becomes worn down. Even without the rope the deep groove in these shoes makes them much easier on the hoofs, as on soft ground the groove fills with earth, which acts as a substitute for the rope in lessening the shock of the nails on the hoofs.

Cast-iron rope horseshoes are made on the same principle as the forged, but are not manufactured in this district nor in Bavaria.

[From Vice Consul General A. Schlesinger, Munich.]

#### **Popular in Munich.**

According to private estimates, about 90 per cent of the hind feet and 70 per cent of the fore feet of horses in Munich are provided with rope horseshoes. These are considered a most practical form of shoe in Munich, but they seem to be employed to only a small extent in the country and are said not to be used by the military authorities. A special kind of rope horseshoe invented in Munich is provided with rope intersected or interwoven with wire, which seems to give greater security from slipping and to last longer than ordinary rope.

---

#### **HORSESHOE NAILS IN SOUTH AFRICA.**

[From Consul E. A. Wakefield, Port Elizabeth.]

The demand for horseshoe nails is fairly good throughout the Port Elizabeth district. Away from the railways, the trek wagon with five to eight pairs of bullocks is still very much in evidence. Horses, mules, and donkeys are used in more populated centers for drawing heavy loads. In the country horses are used chiefly for riding and driving. As the roads are usually quite rough all these animals require frequent shoeing.

Imports of screws and nails into this consular district in 1911 amounted to \$62,000, of which 59 per cent was from Great Britain, 16 per cent from Germany, 10 per cent from America, and 8 per cent from Belgium. The exact figures for horseshoe nails can not be given as they are included with ordinary nails and screws in statistical returns.

The sizes most used are Nos. 5, 6, 7, 8, and 9, with a strong probability of a No. 4 being shortly imported for oxshoes. Packed in boxes of 25 pounds, prices on these nails are: No. 5, \$6.32; No. 6, \$5.60; No. 7, \$5.18; No. 8, \$4.56; and No. 9, \$4.32, with discounts of 62½ per cent and 5 per cent. These prices are quoted f. o. b. in England for one of the best-selling British makes of horseshoe nails.

[The Transvaal market for horseshoe nails was discussed by Vice Consul Charles B. Henderson, of Johannesburg, in Daily Consular and Trade Reports of Apr. 30, 1912. The list of Port Elizabeth and East London importers, also samples of these nails, supplied by Consul Wakefield, may be had from the Bureau of Manufactures.]

**SUGAR-BEET CULTIVATION IN UNITED KINGDOM.**

[From Consul General John L. Griffiths, London.]

Experiments to ascertain if the sugar beet can be grown successfully in the United Kingdom were conducted by the Board of Agriculture, under the superintendence of the staffs of various agricultural colleges and schools, in 1911, during the summer of which year an abnormal drought prevailed throughout the greater portion of the United Kingdom.

The gross yield in tons per acre varied from 5 to 26.6, the average being 13.2 tons. The estimated net factory weight ranged from 4.5 tons per acre to 18.8 tons, the average being 11.1 tons. The percentage of sugar per ton ranged from 15.8 per cent to 18.5 per cent, the average being 17.3 per cent. The average yield of sugar beets in Prussia last year was about 6 tons per acre. This yield was only a little in excess of that obtained at the poorer experimental stations in England.

**Cost per Acre.**

The total cost per acre of the sugar-beet crop and a crop of mangolds (when a comparison is possible) is shown below:

Station.	Total cost per acre.	
	Beets.	Mangolds.
Wye.....	\$58.00	.....
Midland.. (College farm).....	52.79	.....
(Other farm).....	47.92	.....
Harper Adams.....	53.25	\$44.51
Cirencester.....	53.20	40.38
Essex.....	44.51	.....
Seale Hayne.....	51.57	.....
Ridgmont.....	46.40	38.51

The average cost of the English sugar-beet crops was between \$46.23 and \$53.53 per acre.

**Norfolk Factory—Importance of Industry.**

As the result of private initiative, about 3,500 acres in the county of Norfolk have been sown with sugar beet this spring, and a factory is to be built to handle this crop. The capacity of the factory will be 1,000 tons of roots a day. There was little difficulty in obtaining the acreage so that an extensive crop might be planted, as the farmers were very willing to offer land for that purpose.

In view of the increasing consumption of sugar and the fact that the average consumption in England in 1911 was about 82½ pounds per individual of the population, and that the total importation of sugar into the United Kingdom in 1911 was of the approximate value of \$131,395,500 (of which more than two-thirds was beet sugar), the importance of encouraging the British sugar-beet industry will be readily appreciated.

[Other references to sugar-beet culture in England appeared in Daily Consular and Trade Reports on July 18 and Sept. 21, 1910, Mar. 3 and Nov. 22, 1911, and May 22, 1912; and an article on the shortage of sugar in Great Britain was published on Dec. 16, 1911.]

**MANUFACTURING BANANA FOOD PRODUCTS IN JAMAICA.**

[From Consul Julius D. Dreher, Port Antonio.]

Reports from this consulate on "The 'Banana figs' of Jamaica," in Daily Consular and Trade Reports for July 12, 1911, and on "More banana food companies in Jamaica," in the issue for October 28, 1911, attracted wide attention and brought to this office and to the Jamaican manufacturers of banana food products a great many letters of inquiry from the United States and also from Hawaii, England, France, Germany, and Austria. When the former report was written there was only one factory of any size in operation making banana figs for export; in the latter report it was stated that three other companies were building factories in Jamaica. It may now be said that these three companies and two others are in operation, that another is building a factory, and that one or two other companies have been formed.

**New Factories and Various Types of Machines.**

The original factory, which has been operating about six years at Gayle, claims to have a secret process for making banana figs. A large factory at Montego Bay had its machinery made after its own designs in New York. Two other companies expect to patent their machines, which have been locally designed and manufactured. It is understood that the drying is done by hot air and that it takes 400 to 500 pounds of fruit to make 100 pounds of the figs. For a good many years experiments have been made in drying bananas, but it has been difficult to find a process for making a product that would keep well. Now that manufacturers are using a variety of machines and apparatus it is to be expected that the best process will soon be known. Although worms are never found in ripe bananas, the preserved fruit if left exposed attracts insects and soon becomes infested with small worms, as is the case also with other dried fruits.

The food products manufactured are fig bananas or banana figs, cooking bananas, banana chips, flour, and meal. All the factories dry or evaporate the bananas whole without the addition of sugar, and yet they are sweet and palatable, like pressed figs, which they also resemble in color. At least one factory cuts the bananas into short pieces before drying or evaporating them, thus making a product that looks much like the dried figs of commerce. It seems that it would be well in order to make a distinction to call the bananas cut into pieces "banana figs" and those treated whole "fig bananas." What are known as "cooking bananas" are so thoroughly dried as to be hard, the color of these being almost white. Broken into pieces they form "banana chips," which not meeting with duties are imported to be ground into meal or flour in the country of consumption. In spite of the fact that the meal is said not to keep well, one Jamaica factory uses an American gristmill for grinding the chips into meal. Another company has its own factory in London, to which it exports the chips to be ground into flour and meal and made into other preparations for market. A small booklet is issued there to set forth the dietetic value of banana foods as attested by British and German food experts and others; and there is added a list of products on sale, with recipes for their use, etc. These banana food products have been awarded many prizes, diplomas, and certificates of merit.

**Value of the Banana as a Food.**

It seems that all banana food products are wholesome and nutritious. The figs are delicious and are likely to be preferred to real figs by many persons. The fig bananas cut into small pieces may be used like raisins to impart an additional flavor to cakes and puddings. The chips, after being well pounded or ground in a coffee or other hand mill, may be boiled and then used as an excellent breakfast food or for making delicious puddings. Gruel, porridge, and other preparations made from banana flour and meal, which are rich in easily soluble carbohydrates, are recommended for infants, invalids, and dyspeptics. The negro women of Jamaica use banana meal gruel as a substitute for milk for their infant children. The banana itself is one of the most wholesome and nutritious of fruits if eaten slowly when it is perfectly ripe (that is, just before it decays), but not when devoured only half ripe, as is often the case in the United States, which causes many persons to regard bananas as being difficult to digest.

It seems only necessary to make the value of banana food products known in order to create a large market for them. Already they are to a considerable extent popular in Germany and Great Britain, which have been taking the bulk of the exports of such products from Jamaica. When bananas are selling at a low price, as is usually the case in this colony during the fall and winter, it is quite profitable to use them for manufacturing purposes. As the world's demand for these products increases it is to be expected that bananas will be grown extensively in districts too remote from shipping ports or railroad facilities to make their exportation practicable. In Jamaica several factories have already been built in such districts. In banana-producing countries far removed from large markets, like the Society and the Samoan Islands and other island groups in the Pacific Ocean, this fruit could be grown at small expense for manufacturing food products. Especially adapted to such an undertaking is Tahiti, the principal island of the Society Group, which has steamship communication with San Francisco and New Zealand and Australia, all too distant for exporting the fruit itself to advantage except in vessels built especially for that purpose. The Hawaiian Islands and the Philippines also seem to offer inviting fields for the profitable manufacture and exportation of banana food products. This consulate has received an inquiry from Honolulu with regard to this method of using bananas.

**Supply, Output, and Packing.**

Owing to the high price paid in Jamaica for bananas for export to the United States from March to July, inclusive, the factories either discontinue operations during those months or use mostly the small unmarketable bunches of fruit for manufacturing purposes. In order to have a continuous supply of fruit several companies are making arrangements to grow bananas for their own use. Owing to the prevailing high price of bananas, one company could not undertake to fill a recent order for 100 tons of chips. Another company, which could not accept orders from importers in the United States last fall because its entire output was under contract for shipment to Europe, is taking steps to enlarge its factory in order that it may be in a position to meet the increasing demand. So far as can be ascertained, the combined capacity of the Jamaica factories is 12 to 15

long tons a week; but the output may be considerably increased by next winter. The fig bananas, the chief article produced, are generally packed for export in boxes of 56 pounds each (one-half of a British hundredweight), though some are put up in 1-pound packages. There is no export duty on banana food products. The retail price of the figs in Jamaica is 8 to 12 cents a pound and the export price for figs or chips is about \$150 a long ton (2,240 pounds). Samples may be obtained from the factories.

As the manufacturers complain that most of the letters of inquiry from the United States come short-paid, it may be well to state that although Jamaica is a British colony the correct letter postage from the United States is 5 cents; and that when only a 2-cent stamp is used it costs 3 cents deficient and 3 cents penalty postage, or 6 cents in all, to take such a letter from a Jamaica post office.

[With his report the consul has sent samples of banana foods. He has also given the name of the New York manufacturing firm and the addresses of the London factory and the Jamaica companies referred to in his report. These are all obtainable from the Bureau of Manufactures at Washington.]

### ROUMANIAN AGRICULTURAL STATISTICS.

[From American Minister John B. Jackson, Bucharest. See also Daily Consular and Trade Reports for Apr. 3, 1912.]

Roumania's agricultural production in 1911 had a total value of \$269,042,000, which was \$17,273,500 more than in 1910. Cereals made up about 83 per cent of the total, with a value of \$224,266,000, of which wheat formed \$90,517,000 (about 1 per cent less than in 1910), maize \$79,072,100 (25 per cent more than in the preceding year), barley \$16,366,400, oats \$10,518,500, and rye \$3,647,700. The value of the oleaginous and textile plant crop was \$3,975,800, of which \$2,142,300 represented colza (rape) and \$1,351,000 flax. The average price of wheat was \$3.47 per 220.46 pounds; of maize, \$2.66; barley, \$2.88; oats, \$2.61; rye, \$2.84, and colza \$5.08.

Among the vegetables the bean crop was valued at \$144,750 and the potato crop at \$1,775,600, sugar beets at \$1,254,500, tobacco \$1,302,750, garden vegetables \$3,203,800, and fodder plants \$15,613,700.

The wine harvest represented a value of \$8,916,600 (about a third more than in 1910) and the prune harvest \$1,872,100—less than half that of the preceding year, owing to the fact that prune trees are being cut down to make room for more profitable crops.

### Sale of Bleached Flour.

The State Department of Agriculture of South Carolina has issued a notice that, after July 1, flour offered for sale in that State, bleached by any process, must be labeled "Bleached" in letters not less than one-half inch in height. The State inspectors have been instructed to enforce the law. Many States of the United States have similar provisions regulating the sale of this article, while still other States follow the Federal regulations as laid down in the "Notice of Judgment No. 722, food and drugs act of June 30, 1906." Copy of this notice can be obtained by addressing the United States Department of Agriculture.

**PRODUCTION OF MEAT IN FRANCE.**

[From Consul Louis Goldschmidt, Nantes.]

Better methods of feeding and breeding have wrought much improvement in French cattle in the last half century. Whereas in 1862 oxen were generally slaughtered at an average age of 8 years, they are now killed at 4 years and 6 months; besides, the average yield of meat has increased from 225 kilos (496.04 pounds) to 365 kilos (804.69 pounds).

Thirty years ago sheep were slaughtered at 3 years; now they are killed at 2 years and 2 months, and the average yield of meat per sheep is to-day 21 kilos (46.3 pounds) instead of the former 18 kilos (39.68 pounds). Hogs are slaughtered at 10 months instead of 14, and they yield about 100 kilos (220.46 pounds) of meat against 88 kilos (194 pounds) formerly.

According to official statistics, the number of horned cattle in France increased 1,500,000 head during the 47 years from 1862 to 1909. The number of hogs rose from 6,047,543 to 7,505,850 during the same period. On the other hand, a decline is shown in the number of sheep which, in 1862, was 29,500,000, and in 1909, 17,350,000. This latter decrease is due to the modification of agricultural conditions, to the increasing difficulty in finding good shepherds, etc. It is, however, stated that the number of sheep is much larger than that shown by official statistics.

**Production and Consumption.**

The production of all meat in France is also steadily increasing as is shown by the following figures, the quantities representing metric tons of 2,204.6 pounds: 1862, 1,161,218 tons; 1892, 1,570,945 tons; 1897, 1,920,400 tons; 1909, 2,311,778 tons. The increase thus shown is 1,150,560 metric tons, or 99 per cent, while the number of animals has been increasing in a less proportion.

From these figures the annual per capita consumption of meat in France can be adduced: 1862, 57.1 pounds; 1892, 91.18 pounds; 1897, 111.27 pounds; 1909, 125.68 pounds.

To sum up the situation, it is considered that French agriculture is able to supply its national demand for meat, and that it may even be in a position to export cattle. But in spite of the increase in production of animals, all kinds of meats have increased in retail prices 25 to 50 per cent of their value 20 years ago.

**SANITARY SUPPLIES FOR JAPAN.**

[From Consul George N. West, Kobe.]

In Kobe, as throughout Japan, there is no sewerage system. There are waterworks owned by the municipality, which puts the pipes, etc., into houses needing them and also does all the repairs. It might be advisable for American firms desiring to sell their outfits to send catalogues to the mayors of the larger cities. Outside of the foreign hotels, the Kobe Club, and a very few of the foreign houses, there are no lavatories, water-closets, bathtubs, etc., such as are in use in America. The bathtub in almost universal use is made of wood, and the water is heated by a small charcoal stove. Only one firm in Kobe deals in sanitary goods and plumbing supplies. Its address will be found in the World Trade Directory issued by the Bureau of Manufactures.

**INDUSTRIES SUBSIDIARY TO THE CHAMPAGNE TRADE.**

[From Consul W. Bardel, Rheims, France.]

There are in this consular district of France, and particularly in the city of Rheims, a number of enterprises which, while only accessory to the principal industry, that of making champagne wine, are quite important in themselves.

Chief among these auxiliary industries is the manufacture of champagne bottles, whose production is fraught with many difficulties. The champagne bottle has to be constructed in all its parts of an almost mathematical even and heavy thickness; its glass must be perfectly smooth and unaffected by the acids contained in the wine; its neck must be exact in every particular, to insure perfect corking, and with no grain or projecting points on the inside. So much progress has been made within the last 10 or 15 years that, where formerly a breakage of 5 per cent was considered very small, at the present time the average breakage does not exceed 1 per cent. Despite the perfection as to strength reached in the production of champagne bottles, the strain upon them caused by the pressure they sustain and the repeated handling they undergo weakens them to such an extent that it is considered unsafe to use the bottles a second time; and, with the exception of smaller houses making the cheaper brands, champagne manufacturers place their wine in none but entirely new bottles.

**Rheims Bottle Works—Corks—Boxes and Baskets.**

Four glass-blowing establishments in this city, of which one is among the largest in France, and several others in the northern part of the Rheims consular district make almost exclusively bottles for champagne wine. They work night and day in three shifts of 8 hours each and turn out about 40,000,000 bottles annually. While machinery is now applied in the manufacture of bottles for still wine, liquors, medicine, etc., no machine has as yet been invented which could supersede manual labor in the manufacture of champagne bottles. The men performing this difficult work are well paid.

Another important industry of this consular district entirely dependent on the wine trade is the manufacture of corks for champagne bottles. The material for these corks is principally imported from Spain, in which country is found a tree whose bark is resistant enough to permit of its use for this class of corks. The work of dressing and testing the bark and completing the cork is in the hands of very skilled workmen, most of whom are well-paid Spaniards. Since it is very difficult to procure a bark thick enough to make a good cork out of one piece, a number of the corks made nowadays are composed of two pieces of thin bark pasted together lengthwise. This process of pasting the pieces together is patented; and since the corks thus made seem to answer in every respect the demands made upon them, a number of cork manufacturers are now working under this patent, apparently with very good success. There are about 20 cork manufacturers in this district turning out annually 100,000,000 corks, of a value between \$1,351,000 and \$1,544,000.

Local woodworking establishments supply the champagne houses with the boxes in which the wine is shipped to foreign countries. These are made in a mechanical way; and while they are very sub-

stantial, they are of a superior finish and give remunerative occupation to many workmen. Several large willow-working manufacturers furnish champagne houses with the baskets in which the wine is shipped to places in France and in near-by countries.

**Straw Jackets—Machinery, etc.—Good Crops Needed.**

Several firms make a specialty of the straw covers in which the bottles are encased before being packed in boxes or baskets; the straw used for these covers is cut and sewed by machinery. This industry encourages the cultivation of rye in this immediate neighborhood, the straw being used for the manufacture of the covers and the rye sold to other countries, mostly to Germany.

Two firms in this city and four at Epernay construct special machinery for the manipulation of champagne wine, such as automatic bottling machines, machines for cleaning, for corking and uncorking, for wiring bottles, etc. Presses for extracting the juice from the grapes are made by several important concerns in this consular district. (Some hydraulic presses have recently been brought from the United States.) One large concern makes a specialty of manufacturing metallic capsules and tin foil for champagne bottles, and numerous lithographic establishments are engaged in producing artistically decorated labels.

It is safe to say that the aforesaid industries give employment to more than 5,000 skilled workmen. For their future prosperity much depends upon abundant harvests of grapes, the crops during the last five years having proved to be so insufficient that only several good yields will prevent the champagne trade and its auxiliaries from suffering a very severe setback.

---

### MANCHURIAN FREIGHT CHARGES ON BEANS.

[From Consul Albert W. Pontius, Dalny.]

The first deal of the season in junk beans was recently concluded on the Newchwang market. The junk freight on beans from Mafengkow to Newchwang, which was quoted at 10 tiaos per koku (koku = 5.118 bushels) at the outset of the season has risen by  $\frac{1}{2}$  tiao, so that the transportation of 160 koku (equivalent to a railway carload of 30 short tons), including commission to junk owners and other charges, now (Apr. 30) costs 238.87 yen (\$118.96). By railway from Tiehling to Newchwang the rate is 253.65 yen (\$126.32), or 14.78 yen (\$7.36) more per carload than by water.

Of course, the quicker transportation and perfect safety of the goods guaranteed by the railway transportation must be taken into consideration as an advantage over the waterway carriage, which, besides taking eight days for the trip, exposes the beans to the danger of getting wet in transit, or to the molestation of bandits.

---

### International Congress of Tachygraphy.

The Spanish Minister at Washington announces that the Tenth International Congress on Tachygraphy, organized by the Spanish Tachygraphic Federation, will be held at Madrid September 26 to October 2, 1912. An invitation is extended to the stenographers of the United States to take part in this congress.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8983. Pipes for water mains.**—An American consul reports that a Latin-American municipality is about ready to install new pipes for its entire water system and desires to buy several carloads of pipe from 6 to 12 inches. Prices on this material are desired as soon as possible. All correspondence should be addressed to an individual named in the report.
- No. 8984. Locomotives and passenger coaches.**—A report from an American consular officer in a European country states that a railway company in his district is in the market for two locomotives and six modern passenger coaches. Specifications, etc., can be secured from an individual whose name is given in the report. The amount to be expended will be about \$54,000.
- No. 8985. Bank furniture and fixtures.**—A European bank is constructing a new office building for its own use. No imported materials will be used in the structure itself, but new office furniture, bank fixtures, safes, and vaults will be required. An American consul writes that American vaults are in great favor owing to the way in which they have withstood fire in several recent disastrous conflagrations in the United States. All communications should be addressed to the manager of the bank.
- No. 8986. Hardware and engineering specialties.**—A business firm in the United Kingdom has informed an American consulate that it is interested in hardware and engineering specialties. This concern has good trade connections among ironmongers, hardware merchants, mill furnishers, engineers, and machinery merchants in the country. It would like to get in touch with American manufacturers of small tools for engineers, hardware and house furnishers, and domestic specialties of every description.
- No. 8987. Machine guns.**—An Asiatic government is in the market to purchase one or more small caliber machine guns. An official informs an American consulate that offers from German and English firms have been received, but he has agreed to wait a reasonable time in order that American firms may forward catalogues and prices. These should be sent as soon as possible.
- No. 8988. Club furniture and fixtures.**—An American consul reports that a club in his district will shortly erect a new clubhouse. There will be no opening for the sale of American building materials, with the exception, perhaps, of some parquetry flooring, but the usual club fixtures and furniture will be required, such as leather upholstered furniture, dining room furniture, office furniture, billiard tables, lockers, etc. Communications and advertising matter, both in Spanish, if possible, should be sent to an address given in the report.
- No. 8989. Motor-car service.**—A contract has just been signed between a Latin-American government and a business man for the establishment of a freight and passenger motor-car service to run through several towns, a distance of 226 miles. This contract is made for 30 years and works must be started within a year after the approval of the same. An American consul writes that this service should prove of great value to the farmers by furnishing transportation facilities for their products. It might be to the advantage of American manufacturers of freight and passenger cars, accessories, material for station buildings, etc., to correspond with the holder of this contract. Communications should be in Spanish.
- No. 8990. Woodworking machinery, engines, and boilers.**—An American consul reports that he recently had an interview with the representative of the principal exporter of lumber from his district, as well as the principal sawmill owner. At present he owns four mills and is erecting a fifth; also a modern veneer factory, the machinery of which is entirely of American manufacture. A request is made that this owner be supplied with a full line of catalogues covering all kinds of woodworking machinery, including door and sash, as well as box and barrel machines, also cheap portable and semiportable boilers and engines, many of which are manufactured in the United States. At present there is only one band saw used, owing to the lack of skilled labor in handling such machines, and all the mills are equipped with gang or frame saws of European manufacture. Copy of the complete report, giving further particulars, will be sent to interested firms by the Bureau of Manufactures.

## GERMAN AIR CRAFT AND AUTOMOBILE INSURANCE.

[From Consul General A. M. Thackara, Berlin.]

The underwriting of aerial risks has been carried on in a tentative way and as a side line by several German life and accident insurance companies for two years or more. The results of experience to date appear not to have been altogether encouraging to these companies, and all are now carefully circumscribing the scope of their operations. Conditions attending insurance against liability for damages arising from injury to persons and property have been made highly restrictive; the rates for the insurance of aeronauts (those who go up in lighter-than-air craft) have recently been increased; the insurance of aviators (those who go up in heavier-than-air craft) against death seems to have been abandoned altogether; and the number of aerial policies of any kind which are now being written is said to be very small.

One of the companies which had earlier ventured into insurance of aviators against death recently paid a \$12,000 claim arising from such a policy, and in addition a considerable amount to cover the loss on the aeroplane, which was destroyed.

### Aviator's Insurance Found Unprofitable.

A Swiss insurance company which does an accident business in Germany, including automobile insurance, etc., has recently abandoned altogether the insurance of airmen and air craft. During the two years in which it experimented in the field of aerial insurance it wrote about 100 policies. For insurance against death, it charged an annual premium of \$110 for a \$2,380 policy, and the same premium for accident insurance, giving a daily remuneration of \$2.40 during invalidity. Although these rates were increased later, the company found the business unprofitable. It is said to have sustained especially heavy losses in one aeroplane catastrophe. A Cologne company, one of the pioneers in the field, has almost entirely abandoned the writing of aerial policies.

None of the local companies will now quote rates for the insurance of aviators against death. The rates for accident insurance for avia-

tors are \$2.38 for a \$238 policy and \$4.76 for a policy yielding a daily remuneration of 24 cents a day during invalidity.

The rates for the insurance of aviators against liability for damages arising from injury to other persons range from \$29.75 for a policy paying a maximum of \$5,950 when one person is injured or \$17,850 when more than one is injured, to \$47.60 for a maximum of \$23,800 for one or \$71,400 for more than one person injured. The rate for insurance against liability for damages to property is 20 per cent of the value of the policy, when damages from fire or explosion are not included, and 30 per cent when such damages are included. The minimum premium is \$2.38 and the maximum liability \$2,380. The rules governing this form of insurance are in general the same as those usually covering other forms of insurance against liability for damages.

#### Increased Rates for Aeronauts.

Owing to the discouraging experience which the companies have had with this form of insurance, the rates charged for aeronauts have recently been raised. They are as follows:

Classification.	For \$238 death policy. <sup>1</sup>	For \$238 accident policy. <sup>1</sup>	24 cents per day remuneration policy. <sup>1</sup>
Dirigible balloons: <sup>2</sup>			
Each ascension.....	\$9.00	\$9.24	\$9.36
Motorless balloons:			
1 trip.....	1.10	.65	.71
5 trips per year.....	5.50	1.79	2.05
More than 5 trips per year.....	5.95	2.28	2.57

<sup>1</sup> Maximum insurance, death or accident, \$4,760.

<sup>2</sup> Maximum remuneration policy, \$4.76 per day.

<sup>3</sup> Effective only if ascension is made in Zeppelin, Parseval, Gross, or Clouth airships.

Insurance against accident of those who go up in motorless balloons, as in the case of aeroplane accident insurance, is usually written in connection with ordinary accident insurance. The rates for this combined insurance are the same as for ordinary accident insurance, plus the rates quoted above.

#### Automobile Insurance—General Field of Companies.

There are about a dozen companies represented in Berlin which write automobile insurance. Their field includes (1) insurance of the owner against liability for damage to persons or property, (2) insurance of the automobile against damage from accident, fire, explosion, theft, etc., (3) insurance of passengers taken on a tour, (4) insurance of tires, (5) insurance of baggage carried, (6) insurance of chauffeur, and (7) insurance of automobile for safe transportation.

It is the rule that insurance written in Germany is valid only in continental Europe. An extra payment is generally required for insurance written to cover the British Isles.

The premiums charged for insurance against liability for damages are scaled according to the taxable horsepower of the automobile. For such insurance the law specifies \$2,380 as the maximum limit of liability for damage to property, \$11,900 as the maximum limit of liability for damage to one person, and \$35,700 as the maximum limit of liability of all kinds for any one accident. On this basis the yearly

premiums charged by four companies represented in Berlin for policies written on privately owned automobiles are as follows:

Classification.	Premium.	Classification.	Premium.
<b>First company:</b>		<b>Third company:</b>	
1 to 7 horsepower.....	\$16.66	1 to 6 horsepower.....	\$22.49
8 to 13 horsepower.....	26.18	7 to 12 horsepower.....	32.13
14 to 25 horsepower.....	33.32	13 to 25 horsepower.....	51.41
Over 25 horsepower.....	42.84	Over 25 horsepower.....	53.55
<b>Second company:</b>		<b>Fourth company:</b>	
1 to 6 horsepower.....	27.37	12 to 25 horsepower.....	47.60
7 to 12 horsepower.....	35.70	Over 25 horsepower.....	59.50
13 to 25 horsepower.....	47.60		
Over 25 horsepower <sup>1</sup> .....	59.50		

<sup>1</sup> For members of automobile clubs only; special rates to nonmembers.

#### Insurance Against Bodily Injury, Damage, Fire, Theft, etc.

For a policy specifying \$23,800 as the limit of liability for bodily injury to any one person one company charges members of automobile clubs the following yearly rates: From 1 to 6 horsepower, \$26.98; 7 to 12 horsepower, \$38.56; 13 to 25 horsepower, \$51.41; over 25 horsepower, \$64.26.

Another company offers the following rates for a policy specifying \$23,800 as the limit of liability for bodily injury to any one person and \$71,400 as the limit of liability arising from any one accident: From 1 to 6 horsepower, \$32.84; 7 to 12 horsepower, \$42.84; 13 to 25 horsepower, \$57.12; over 25 horsepower, \$71.40.

For a policy limiting liability for bodily injury to any one person to \$119,000 and liability arising from any one accident to \$238,000, the same company offers the following: From 1 to 6 horsepower, \$41.06; 7 to 12 horsepower, \$53.55; 12 to 25 horsepower, \$71.40; over 25 horsepower, \$89.25.

The usual yearly premiums charged for the insurance of automobiles up to their full value against damage, fire, theft, explosion, etc., are reported to be as follows, the premiums being based on a scale of valuations ranging from 7,000 to 30,000 marks (\$1,666 to \$7,140): Up to \$1,666, \$68.31; from \$1,666 to \$2,380, \$95.68; from \$2,380 to \$3,570, \$124.95; from \$3,570 to \$4,760, \$169.46; from \$4,760 to \$7,140, \$202.30; and over \$7,140, \$285.60.

New automobiles are usually insurable at somewhat reduced rates. It is also usually provided that, if premiums for five years are paid in advance, no premium is charged for the sixth year.

#### Club Rates Lower.

Members of automobile clubs customarily enjoy somewhat lower rates than nonmembers. Automobile clubs also make special arrangements with insurance companies governing all features of insurance. Under one such agreement the rates for insurance against liability for damages arising from bodily injury, limiting (policy 1) to \$11,900 for one person hurt or \$35,700 for more than one, and (policy 2) to \$23,800 for one person hurt and \$71,400 for more than one, are as follows:

Classification.	Policy 1.	Policy 2.
Up to 6 horsepower.....	\$22.49	\$26.99
6 to 12 horsepower.....	32.13	38.56
12 to 25 horsepower.....	42.84	51.41
Over 25 horsepower.....	53.55	64.26

The rates for insurance against liability arising from damage to property with the liability limited to \$2,380 are the same as those given under policy 1.

The rates for the insurance of an automobile against damage range (for \$1,071 of insurance) from (1) \$48.20 covering in full, \$43.38 excluding damage incurred while touring in a foreign country and damage to tires, \$38.56 without personal insurance, and \$34.70 with a personal insurance of \$12, up to (2) \$208.85 covering in full, \$176.72 excluding damage incurred while touring in a foreign country and damage to tires, \$144.59 without personal insurance, and \$130.13 with \$12 personal insurance.

The foregoing are the rates for automobiles which are not more than two years old. For cars two to four years old the company may charge the same rates, or others not more than 25 per cent in excess thereof. For cars four to six years old the rates may not exceed those for new cars by more than 33 per cent, and for cars older than six years the excess may be not more than 50 per cent.

#### Club Rates for Accident Insurance.

Accident insurance under this club agreement is classed under three heads: (1) Insurance of owner, (2) insurance of chauffeur, and (3) insurance of touring passengers. The insurance of the chauffeur may be (policy A) against accidents suffered while doing any work connected with an automobile in the service of the insured; (policy B) against any accidents in the service of the insured; and (policy C) against any accidents in or out of the service of the insured. The premiums chargeable, in accordance with this agreement, for each of the above kinds of accident insurance, are as follows. The rates for death are quoted per each \$238 of insurance, and for injury (class 1) for each \$238 of cash payment and (class 2) for each 24 cents of daily remuneration.

Kind of policy.	Premium.	Kind of policy.	Premium.
<b>Insurance of owner or touring passengers:</b>		<b>Insurance of chauffeur—Continued.</b>	
Death.....	\$0.14	<b>Policy B—</b>	
Injury.....		Death.....	\$0.24
Class 1.....	.19	Injury.....	
Class 2.....	.65	Class 1.....	.35
Combined.....	.98	Class 2.....	1.75
<b>Insurance of chauffeur:</b>		Combined.....	2.30
<b>Policy A—</b>		<b>Policy C—</b>	
Death.....	.21	Death.....	.20
Injury.....		Injury.....	
Class 1.....	.32	Class 1.....	.40
Class 2.....	1.61	Class 2.....	2.07
Combined.....	2.14	Combined.....	2.76

When in case of accident there are more passengers in the car than are provided for in the accident policy, the liability for each passenger decreases in proportion as the number of passengers actually in the car is greater than the number provided for in the policy.

The rates of premium for injury apply to the payment of annuities; for the payment of cash down an extra payment of 50 per cent must be made.

[A partial list of the companies writing automobile and aeroplane insurance represented in Berlin, a translation of the terms of insurance offered by one company, and a translation of portions of the German automobile law, forwarded by Consul General Thackara, may be obtained from the Bureau of Manufactures.]

**CANADIAN REGULATIONS FOR MOTOR TOURING.**

[From Consul Fred C. Slater, Sarnia, Ontario.]

As a large number of Americans with automobiles tour this part of Canada every season, the substance of the principal regulations for the Province of Ontario is presented:

1. The driver must be at least 18 years of age, and in no way intoxicated.
2. Any person operating an automobile for gain or hire must be licensed to do so; and no person may employ another for that purpose unless so licensed.
3. No automobile is allowed on the public highway unless provided with a provincial license and number, which cost \$4 per calendar year.
4. At all Canadian ports of entry will be found a customhouse broker who provides foreign tourists with auto licenses. Ordinarily this broker is the representative of a bonding company, and will bond cars against interference by the customs for six months, for which the deposit is \$10. The tourist is given a copy of this bond, and upon finally returning out of the country, he should have the customs at outgoing port certify that fact upon the copy. This copy should then be sent to the issuing broker, who sends the release of bond obligation and \$5, keeping the other \$5 for his services.
5. The auto must be provided with a gong or horn and suitable lamps.
6. No other number than that of the provincial license may be exposed, and must be kept clear and plainly visible. No searchlights are permitted.
7. The maximum speed within city limits is 15 miles per hour; in country, 20 miles. But drivers are enjoined to slow down whenever the exigencies require it. Upon passing a team, slow down to 7 miles; and when going in same direction sound the gong and give driver an opportunity to turn aside. Upon meeting a funeral, turn aside as much as possible and stop until it has passed.
8. If an accident occurs to any person on foot, horseback, or in a vehicle, owing to the presence of the automobile, the person in charge thereof must go back to the scene of the accident and give in writing to the person sustaining loss or injury the name and address of the owner of the motor vehicle and number of license.
9. In case of injury or damage the onus of proof that the same did not arise through the negligence of the driver of the automobile rests upon the owner or driver thereof.
10. Violations of any of these regulations are punishable by fine or imprisonment, or both. Any police officer may in good faith make arrests without a warrant; and "every person may arrest without a warrant any person whom he finds committing any such offense" above referred to.

**PRINTING OFFICES IN HONDURAS.**

[From Consul A. T. Haeblerlé, Tegucigalpa.]

The principal printing office in Tegucigalpa is the Government establishment, equipped with 3 cylinder and 6 pedal presses. A bookbindery employing 9 men is maintained in connection with the printing office, the total number of employees being 80. This office prints everything of an official character; also *El Nuevo Tiempo*, the only daily paper in this city, and accepts orders for job work from people throughout the country. The building is valued at \$24,457, the presses at \$15,319, and the accessories at \$16,581. The book-binding machinery is valued at \$1,158 and the accessories at \$466.

Besides the Government establishment, there is a small job printing office equipped with several pedal presses and owned by a resident of Tegucigalpa, who imports paper and cards and is especially interested in plain and fancy stationery. In addition, a small press is owned by another citizen who edits a small monthly paper, *El Boletín Comercial*, in connection with his business. Occasionally brief articles on agriculture appear in this paper, as the owner is interested in the agricultural development of the country. [The names of these two citizens and of the officials in charge of the Government printing office may be obtained from the Bureau of Manufactures.]

**BÊCHE DE MER IN CHINA.**

[From Consul General George E. Anderson, Hongkong.]

The possibility of developing a considerable trade in bêche de mer, bicho de mar, or trepang, as it is variously known, between the Philippines and China by way of Hongkong merits the attention of Philippine business men. The imports of the product into China for some years past have averaged about a million taels in value, of which Hongkong furnishes generally somewhat more than half and Japan about two-thirds of the balance.

The value of the trade generally and the proportionate share of the markets concerned in it appear from the following table of imports of bêche de mer into China:

Sources.	1908	1909	1910
Hongkong.....	\$460,852	\$223,750	\$223,750
Japan.....	283,762	264,473	277,876
All other countries.....	71,735	98,436	118,634
Total.....	\$816,298	686,661	720,260

**Sources, Grades, and Prices.**

The Philippines exported bêche de mer to China, and to Hongkong for China, in the fiscal year 1911 to the value of \$36,615 gold, in contrast to \$392 the year before and none previous thereto. The total exports of the product from the Philippines to all countries in the fiscal year 1911 amounted to \$50,723, as compared with \$7,274 in the previous fiscal year and \$5,096 in 1909.

The imports of bêche de mer through Hongkong come largely from Burma and the East Indies, the north coast of Australia, the South Sea Islands, Indo-China, the Straits Settlements, New Guinea, and from the tropical Pacific islands generally, notably from coral reefs. The product is a sea slug embracing several species of the echinoderms. These sea slugs are 6 to 15 inches long, are shaped somewhat like cucumbers and are sometimes referred to as sea cucumbers, and the several varieties come with or without ambulacral feet, known in the trade as teats.

In general, five varieties or grades are known in the trade. The first grade or prime variety is the "brown with teats"; the second "large black"; the third, "small black"; the fourth, "red bellied"; and the fifth, "white." The smooth varieties or grades are also known as "closed" and those with the feet as "open" slugs. The more general divisions in the trade are into red and black.

Prices vary from year to year and for the different grades, running from \$25 to \$150 local currency per picul of 133½ pounds. The product as received here and as generally handled in large quantities is then sorted into as many as 25 grades, these being sold on the Hongkong market to-day (April 9) at prices ranging from \$11.10 to \$213 local currency per picul, the local dollar to-day being valued at about 47 cents gold. Shipments of fair grade stock in good condition generally bring approximately 15 cents gold per pound. The Chinese customs valuation for all imports in 1910 was at the rate of 15 cents gold per pound.

**How Prepared—Uses—Trade Methods.**

There is immense variation in the condition of the product, however, which affects prices. The slugs are cured by being boiled

whole for some time, after which they are cleaned and then dried in the sun or over a quick fire. They absorb moisture very readily after drying, so that unless they are properly packed they become damp and spoil rapidly. A considerable quantity of the goods arrives in Hongkong in bad condition.

Bêche de mer is used all over China and is very popular in making soups and similar dishes. The consumption in general is proportionate to the population, Tientsin and Shanghai importing largely for their respective trade territory in North and Middle China and other ports in varying proportion according to their population, wealth, and proximity to the sea. Even Chungking imported \$41,580 worth in 1910.

The goods are handled in Hongkong largely by some of the import commission houses which make a specialty of the trade and by Chinese firms dealing direct [whose names are obtainable from the Bureau of Manufactures]. The bulk of the business has long been done by a few firms which have a well-established clientele and sell for well-established collecting markets elsewhere. They are disposed to protect their present trade and buy only of old-time markets, so that it is difficult for new trade to be started.

---

### FANCY PRICES FOR OSTRICH FEATHERS.

[From Consul E. A. Wakefield, Port Elizabeth, South Africa.]

The highest prices paid for ostrich feathers in years in the Port Elizabeth market were obtained on April 30. These feathers, prize winners, specially selected and exhibited for show purposes, were placed on sale and following were some of the prices per pound realized: Primes (whites), \$487, \$353, \$328.50, \$296.85, and \$194.66; feminas, \$109.50 and \$97.35; spadonas, \$47.45 and \$34; fancies (byocks), \$76.65. These are of course above the actual market value by a considerable margin. Prize-winning feathers always reach a fancy figure on the market largely as a matter of sentiment. This year, however, the prices were unusually high and with one exception were the highest ever obtained in this market.

---

### Mexican Excursion to the United States.

Consul A. J. Lespinasse, of Frontera, Mexico, announces that an excursion has been planned under the auspices of the Chamber of Agriculture of Tabasco, to be composed of the leading business men and planters of that State, for the purpose of visiting the principal commercial and industrial centers of the southern and southwestern sections of the United States. Efforts will be made to secure all possible data relative to the most modern business and agricultural methods now in use in the United States.

---

### Navigation in the Aegean Sea.

The American Embassy at Rome communicates, under date of June 1, the substance of an announcement by the Italian Foreign Office to the effect that access to the islands of the Aegean Sea occupied by the Italian forces is forbidden during the night to all neutral vessels.

## TRADE NOTES FOR NORTH CHINA.

[From Consul General Samuel S. Knabenshue, Tientsin.]

**Shipments from New York to Tientsin.**

Freight from New York and other Atlantic ports for Tientsin and Shanghai usually comes by freight steamer through the Red Sea. The larger of these steamers do not come to Tientsin, but discharge their Tientsin freight at Shanghai into coast steamers, which bring it here. Export agents in New York will furnish the names of freight steamers bound for the China coast.

**Silver Purchases for China.**

Request is made for the prices at which silver bullion or new Mexican silver dollars would sell if consigned to China. While China is on the silver standard, the price of silver as measured in gold fluctuates every day, and it is impossible to give any figures which would be of the least value.

The price of silver in China is governed by the price of silver in London and New York, rising and falling therewith. I made inquiries at the leading foreign banks in this city. They all said that they buy silver in the London and American markets through their bullion brokers, and receive no consignments from individuals. The principal banks here have branch offices in New York City and agents at San Francisco, and they all suggest that Americans having silver to sell should communicate with some of the large bullion-broking firms either in New York or San Francisco, by which the best prices would be obtained. There are no duties, taxes, or impediments of any kind imposed by the Chinese Government on the import of silver.

**New Telephone Lines Will be Installed.**

The telephone mileage in Tientsin on December 31, 1911, was 2,122, and number of stations 1,831—increases of 40 miles and 33 stations in 12 months. The figures for Tientsin will be practically stationary for the present year, owing to the fact that the switchboard is filled, and there can be no increase in number of stations until the entire telephone system of this city is rebuilt. It is intended to undertake this work as soon as possible this year, but even though the new material were ordered immediately the new system could not be in operation until some time in 1913.

In Peking on December 31, 1911, there were 2,136 telephone subscribers, an increase of 505 in 12 months, while 1,434 miles of bare wire and 5,056 miles of cable core were in use. The unsettled condition of business at present and the lack of capital alone prevent a very great increase in the use of the telephone. The Chinese in Tientsin and Peking thoroughly understand the advantage of telephonic communication, and it is only a question of time, plus normal business conditions, to witness an extraordinary development. The trouble in this country is the lack of long-distance lines, the longest at present being about 120 miles.

**Automobiles in Tientsin and Peking.**

The motor-car business is in its inception in North China. Up to a year ago there were only about a dozen motor cars in North China. These were owned in Peking and Tientsin, they being the only cities which have improved roads on which cars are available. Through

the efforts of this office, a little over a year ago a local importing firm was induced to take an agency for an American motor car. It brought out three touring cars as a trial order. These became popular, and up to date the firm has disposed of 16 American cars. This firm also established a garage and repair shop. Seeing its success, a British firm has just established a garage and repair shop, and has taken an agency for a foreign car. There is no garage nor repair shop in Peking.

There would be an enormous market for motor cars in China if the country possessed suitable roads. The roads all through North China are simply cart tracts winding over the country, and have no modern improvements. The streets of the native cities, except Tientsin and Peking, are too narrow to use cars. The streets are from 8 to 12 feet wide, without sidewalks and without macadam or paving. In the foreign concessions of Tientsin and in the newer portion of the native city there are wide, well-macadamized streets, about 50 miles in all. In Peking there is about the same mileage of streets available for motor traffic, including a road to the Summer Palace, 18 miles from the city.

---

### CANADIAN STIMULATION TO SHEEP INDUSTRY.

[From Montreal Gazette.]

Hon. Martin Burrell, Canadian Minister of Agriculture, has appointed Prof. T. R. Arkell, professor of animal husbandry in New Hampshire Agricultural College, to examine into the general condition of the sheep industry in Manitoba, Saskatchewan, and Alberta. Prof. Arkell is a Canadian and a graduate of Guelph Agricultural College. He has made a specialty of the question of sheep breeding and the wool industry.

Prof. Arkell proceeds to Lethbridge about June 12 to start work. He will not only investigate conditions, but he will give his advice and assistance in such matters as shearing, dipping, preparation of wool, shipping, and other matters.

Mr. Burrell's whole policy is for close cooperation with the Dominion Sheep Breeders' Association on a broad scale. Col. McCrae, president of the Dominion Sheep Breeders' Association, has been appointed by Mr. Burrell to go to British Columbia to study the industry there and to inspect and report on districts most suitable for sheep breeding. Dr. Tolmie, live-stock commissioner for British Columbia, will be associated with Col. McCrae in this work. Col. McEwen, president of the Ontario Sheep Breeders' Association, will go to the maritime Provinces on a similar mission.

---

Statistics of agriculture show that the number of sheep in Canada declined from 3,155,509 in 1871 to 2,792,200 in 1911.

Canada imported in the fiscal year ended March 31, 1912, for breeding purposes, 65 sheep worth \$760 from Great Britain and 23 sheep worth \$1,075 from the United States. Of sheep for consumption the imports were all from the United States, viz, 192,530 head worth \$578,055, while the imports of fresh mutton and lamb were 3,950,462 pounds worth \$299,600, derived nearly in equal proportions from the United States and Australia.

In exports, Canada shipped in the year named only 21,783 sheep worth \$125,443 and 49,312 pounds of mutton worth \$4,201, whereas in 1907 Dominion sheep exports to the United States alone exceeded \$1,000,000 in value.

[Previous reports on the Canadian sheep trade and industry appeared in Daily Consular and Trade Reports for Nov. 1, Apr. 18, and Mar. 16, 1911, Dec. 2, Oct. 31 and 10, 1910, Oct. 20, 1909, and Jan. 6, 1908.]

**POWER VEHICLES IN GERMANY.**

[From Commercial Agent Archibald J. Wolfe.]

On January 1, 1912, there were counted in Germany 70,006 power vehicles, 63,162 of which served for passenger and 6,844 for freight transportation. The increase, compared with the preceding year, was 12,201 vehicles, or 21.1 per cent. Of the passenger power vehicles, 23,350, or 37 per cent, were pleasure and sport vehicles, 22,942, or 36.3 per cent, served business purposes, and 7,084 were described as professional (in use by doctors, surveyors, etc.). There were also 5,262, or 8.3 per cent, of power-operated cabs and omnibuses, an increase of 1,000 in one year.

During the year ended September 30, 1911, 18,316 power vehicles crossed the German frontier, of which 6,937 were French, 4,138 Austrian, 2,353 Swiss, 1,628 Belgian, 1,200 Dutch, 628 English, and 494 American. The heaviest land-crossing traffic was in August, 1911, when 4,216 foreign automobiles passed the frontiers.

**Accident Statistics.**

During the period under review 8,431 accidents were officially noted, in which 8,931 automobiles figured. Of the drivers, 92.5 per cent were reported, 1.7 per cent (151) made unsuccessful attempts to flee, and 5.2 per cent (517) actually escaped. In these accidents 4,262 persons were injured and 343 killed. Among the injured, 311 persons were drivers, 702 passengers, and 3,249 pedestrians; among the killed, 24 were drivers, 49 passengers, and 270 pedestrians. The material damage caused by accidents amounted to 1,778,000 marks (\$423,164), of which 82 per cent was damage to the vehicles. Of the 517 drivers who escaped, 252 were finally located. Most of the accidents occurred in the large cities.

The least number of accidents in Germany has occurred proportionately on Sundays (11.8 per cent), and the largest on Saturdays (17 per cent); the second largest number was on Mondays (14.9 per cent). Most of the vehicles figuring in these accidents were from 16 to 40 horsepower. Of the power vehicles involved in accidents, 76.4 per cent were taxicabs and motor busses, 14.6 per cent vehicles of public authorities, and only 12.3 per cent vehicles for sport and pleasure.

**CANADIAN GRAVEL-LEASE REGULATIONS.**

[From Consul Felix S. S. Johnson, Kingston, Ontario.]

Regulations affecting leases of water-covered deposits of sand and gravel on the shores of Lakes Superior, Huron (including Georgian Bay), Erie, Ontario, and Nipissing and the St. Mary, St. Clair, Detroit, Niagara, and St. Lawrence Rivers have been approved by the Ontario provincial government.

It is provided that the applicant for a lease shall file a plan giving full information as to the deposits to be worked and the methods proposed for working them. For the first year the lessee must pay \$1 an acre rental, and thereafter 25 cents an acre. Each lease must be for 10 years. The Province will receive further revenue from a charge per cubic yard of sand or gravel removed, the rate to be fixed by order-in-council. Sworn returns will be required every 3 months as to the quantity removed.

## AUSTRALIAN TRADE NOTES.

[From Consul Wm. C. Magelssen, Melbourne.]

**Victorian Railways.**

A return furnished by the Victorian Railway Commissioners shows that the new rolling stock put into running since July 1, 1911, comprised 56 engines, 77 passenger coaches, and 1,723 freight cars. Of this number, 25 locomotives were built locally at Newport, 20 were imported from the United States, while 11 were of English manufacture, as were also 1,277 freight cars. It is proposed to add another 20 engines to the State's rolling stock, but these are to be built in Victoria.

**Cool Stores.**

The first step toward the erection of State-owned cool stores at Victoria Dock, Melbourne, has been taken. Tenders were invited in April for constructing the concrete foundations of the buildings. The plans provide for a total storage capacity of 310,000 cubic feet. In addition, grading stores, grading rooms, office accommodation, inclosed platforms and covered ways, and all the usual and necessary offices for carrying on the work connected with such an establishment are provided for.

**South Australia's Wheat Crop.**

The 1910-11 acreage under wheat, for grain only, in the State of South Australia was 2,104,717 acres, and the total production was 24,344,740 bushels, which is an average yield of 11.57 bushels per acre. The production of grain for each of the last five years has averaged 21,095,664 bushels and, inclusive of the wheat-hay crop, the mean annual value for the five seasons was \$25,024,813. The value of the 1910-11 wheat-grain and wheat-hay crop at average current prices is \$26,244,709.

**Vineyard Industry in South Australia.**

The viticultural industry in South Australia shows that in the season 1910-11 the total grape production amounted to 36,861 tons, or an average of 1.81 tons per acre. Of this total it is estimated that 21,196 tons were used in making 3,470,058 gallons of wine, 13,134 tons for drying purposes, and 2,531 tons for table consumption and export. There were also produced 15,065 hundredweight (hundredweight=112 pounds) sultanas, 19,680 hundredweight other raisins, and 40,261 hundredweight currants. The area under cultivation was 14,248 acres for wine making, 1,786 acres for table use, 6,918 acres for drying purposes. The estimated valuation of the production of vineyards was \$2,848,289.

**Victoria Dairy Statistics.**

The Victorian dairy statistics for the season just closed show that 86,000,000 pounds of butter were produced—an increase of 16,000,000 pounds as compared with the previous season; 4,500,000 pounds of cheese and 19,000,000 pounds of bacon were also produced.—*Reuter*.

*Duplex telegraph apparatus.*—The duplex system recently introduced into Venezuela has given such satisfaction that, according to a report from Consul Herbert R. Wright, of Puerto Cabello, the Government has placed an order for six additional installations—in the telegraph stations at Barquisimeto, Maracaibo, Trujillo, Merida, Rio Chico, and Cumana.

**GERMAN COMMERCIAL ATTACHÉS.**

[By Commercial Agent Archibald J. Wolfe.]

The German Foreign Office recently sent out an inquiry to the chambers of commerce throughout the country in order to test the actual utility of the German commercial attachés to the business men of Germany. The inquiry also solicits suggestions as to any change in appointment methods and the views of German business men regarding the transfer of the attachés from consulates to embassies.

A number of the chambers have already replied, among them being those of Mainz, Nuremberg, Wurzburg, Dessau, and Constance. In view of the general agreement on most points, the ideas and recommendations of these chambers of commerce are of interest. Members of all the chambers of commerce that have sent in their answers have used, as occasion required, the services of commercial attachés by direct application and are satisfied with the results.

There is a general belief that it is not only best to leave these attachés in consulates instead of sending them on to embassies, where they would be apt to be removed from the business centers, but to increase the number of consulates having such attachés. San Francisco, Buenos Aires, Constantinople, Smyrna, Cairo, Barcelona, Persia, Tokyo, and an additional city in China are advocated for immediate consideration in the increase of the service.

**Qualifications and Tenure of Office.**

It has been pointed out that commercial attachés are not appointed permanently, but can be dropped at any time, with the result that they occasionally avail themselves of opportunities to go into business for themselves in the sphere of their activities, and it is recommended that they be assured of continued employment while they show themselves efficient. The best among available men hesitate to accept appointments holding out no guaranty of continuity or advancement. It is suggested that the initial appointment be for three years, leading to a definite engagement if satisfactory. Pensioning attachés is not advocated, but a higher rate of remuneration is recommended as an offset. The commercial attachés are also recommended as excellent material from which to choose consuls.

The chambers of commerce disapprove of demanding from applicants for positions of commercial attachés that they be graduates of colleges; that is, possessors of doctor diplomas in national economics. A combination of theoretical and practical education is thought a better prerequisite. A thorough knowledge of the countries of ultimate assignment is urged as an essential condition of appointment.

The commercial attachés come at infrequent intervals to Germany, and conferences are arranged between them and interested persons. It is urged that they return at regular intervals and make a round of the principal chambers of commerce for the purpose of these conferences. They are to be spared, as far as possible, the actual tasks of writing and routine work, and to attend to investigations.

It is also suggested that commercial experts be placed in the principal German export centers for the purpose of permanent personal touch with exporters and a better equipment with aids, such as special books, is likewise recommended.

**TRAINING CONSULAR ASPIRANTS IN GERMANY.**

[By Commercial Agent Archibald J. Wolfe.]

In the German imperial budget for 1909 a modest provision was made to enable aspirants for consular appointments to pursue special courses of study at the Academy of Commerce, Frankfort on the Main, and the Colonial Institute in Hamburg, and to do practical work at the various chambers of commerce. The sum asked for was merely 10,000 marks (\$2,380). In 1911 a sum of 20,000 marks was granted for the same purpose, and in 1912 the grant was increased to 30,000 marks.

Only a small number of the aspirants for the consular service could take advantage of the opportunities offered, while the majority were prepared by a two years' course of employment at various tasks in the foreign office. It is now the purpose of the authorities to put an end to the difference in the two methods of training. It is felt that the institutions mentioned, while excellent in their way, are not exactly equipped for training consuls. The questions of export and import, the international problems, and practical consular work are not among the immediate objects of the curriculum.

In October, 1911, a radical departure in the training of consular candidates was adopted. The students pursue their two years' course of employment at practical foreign office work as usual, but there have been introduced special courses of instruction for them. The commercial and industrial conditions of present-day Germany are taught with a special view to consular work. Experts have been secured to instruct in economic relations to foreign countries. Not only specialists in political economy, but practical business men, prominent exporters and importers, cooperate by talks and lectures, and bring the budding consul into touch with practical problems of the import and export trade, informing him of the conditions and needs of Germany's foreign business.

Business and factory managers of prominent enterprises will speak either on self-chosen subjects or on those assigned to them. Consuls on leave of absence in Germany are also assigned to lectures on subjects of consular activities. Inspections of industrial and commercial enterprises will also be undertaken.

The grant of 30,000 marks is expected to cover the additional cost of instruction, especially in view of the fact that much of the tuition will be furnished gratuitously by the lecturers.

---

**BRITISH INVENTION TO COMBAT DUST.**

[From Consul Church Howe, Manchester.]

A Manchester engineer has patented an apparatus which, it is claimed, will prevent the clouds of dust raised in dry weather by automobiles and other vehicles.

The device, which is simple and inexpensive, collects the dust as it rises. The dust is drawn into conduits which are funnel-shaped at the mouth and which run from the rear of the front wheels to the rear of the back wheels. These conduits are connected with a box into which the dust is driven by the pressure of air, or this end can also be accomplished by the aid of a centrifugal fan geared to the driving shaft of the automobile. The contents of the dust box can be discharged by pulling a lever at the front of the vehicle.

**FOREIGN TRADE OPPORTUNITIES.**

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8991. Grain elevators and storehouses.**—An American consul reports that an elevator is to be built in his district, according to specifications and blue prints, which he has forwarded and which can be obtained from the Bureau of Manufactures. He writes that the contract is probably let by this time, but this is a type of elevator of which the Government is constructing a large number. About 13 will be constructed this year and a like number next year, with others to follow in succeeding years. There will also be constructed many smaller elevators or storehouses in different localities. In addition to these, there are to be much larger structures, resembling the largest in the United States. One of these larger elevators is already being built by an American firm.
- No. 8992. Cortex cascara sagrada and radix hydrastis canadensis.**—A foreign business firm has informed an American consular officer that it wishes to import from the United States cortex cascara sagrada and radix hydrastis canadensis or goldenseal root. The firm which makes this inquiry is the largest drug house in the country and it is likely that it will import the articles mentioned in considerable quantities if put in communication with reliable American manufacturers.
- No. 8993. Water filters.**—A report from an American legation states that owing to the fact that the water throughout a certain country is generally muddy, a large number of filters are used. German and French filters are the only ones on the market at present. Filters are used not only in private houses and business establishments, but also in schools and public buildings. If sample filters (not circulars) could be sent to a certain Government office, together with a statement of the price at which they could be delivered at a certain port, a profitable market might be opened.
- No. 8994. Coal.**—A European municipality is in the market for 8,000 tons of bituminous coal to be delivered before October 1, 1912. An American consular officer has furnished the name of a person from whom specifications, etc., can be obtained.
- No. 8995. Shoes.**—The Bureau of Manufactures is in receipt of a communication from an American firm stating that one of its customers in Mexico wishes to be put in touch with American manufacturers of fine shoes. Communications should be sent direct to the Mexican firm.
- No. 8996. Agencies for American firms.**—An American consular officer has forwarded a copy of a letter from a business man who states that he wishes to enter into direct commercial relations with firms in the United States trading in all sorts of fancy goods, novelties, photographic accessories, musical instruments, knives, razors, office supplies, etc. He desires firms dealing in these articles to send direct to him their price lists, catalogues (which may be in the English language), conditions of sale, and samples. No references are furnished.
- No. 8997. Railway carriages.**—A report from an American consular officer states that from trustworthy sources he has learned that certain Government railways will soon order a large supply of new carriages. The order will be partly supplied by home manufacturers and the rest from abroad. No tenders have yet been published. He states that if American builders of railway carriages will furnish him with catalogues, they will be placed on file and brought to the attention of interested persons. Such catalogues might also be sent to two firms named in the report.
- No. 8998. Iron mines.**—A foreign Government official has called the attention of an American consular officer to a large deposit of iron ore recently discovered and has intimated his desire that foreign capital be interested in its exploitation. Should American interests desire to make an investigation of these deposits a representative should be sent to take the matter up with the proper authorities. Copy of the complete report, giving further details, will be sent to interested persons by the Bureau of Manufactures.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the offices named.]

**No. 632. Navy Department supplies.**—The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., will receive bids until June 21 for eight steel coal barges, schedule 4621. Tenders are invited until June 25 for the following supplies: Schedule 4620, deck scrubbing brushes, paint brushes; schedule 4618, combination desk and bracket fans; schedule 4622, complete controlling mechanism; schedule 4635, nickel, electrical recording pyrometer, alcohol storage tanks; schedule 4623, pine-tar oil; schedule 4619, scoop shovels; schedule 4637, mild bar steel. Bids will be received until July 2 for the following: Schedule 4625, flinders iron bars, compensating binnacles; schedule 4631, silver boatswains' calls, steel wire plow rope, ratchet braces, brass pole brackets, twist drills, mounted grindstone, hardware, tools, machinists' handled hammers, brass cabin-door hooks, steel tape measures, carpenters' rules, machine brass screws, machinists' sets, bench vices; schedule 4628, charcoal, window glass, yellow pine; schedule 4632, double insulating flexible conductors; schedule 4624, molded rubber gaskets, hydrants; schedule 4629, lead pipe, rod rivet bronze, wrought bar iron, chain bar iron, medium bar steel, round-rolled cold steel, medium steel; schedule 4634, mand. toilet soap, broken or gravel stone, Virginia or North Carolina pine piles; schedule 4633, sugar; schedule 4626, white-oak railroad ties, flexible copper tubing, North Carolina pine culls, ingot aluminum; schedule 4630, medium angle steel, medium black plate steel; schedule 4627, muriatic acid, beeswax, gray sal ammoniac, coal tar, ferric-oxide varnish, whiting. Tenders are invited until July 30 for 100,000 pairs shoes, high, indestructible sole, schedule 4636. Firms interested in any of these items should make application to the Bureau of Supplies and Accounts, giving the schedule numbers desired.

**No. 633. Furniture, floor coverings, fuel, and ice.**—The General Supply Committee, Treasury Department, Washington, D. C., announces that the date of opening sealed proposals for furnishing articles covering classes 9 (furniture and floor coverings) and 14 (fuel and ice), for executive and independent establishments, has been postponed from June 4 to June 17, 1912.

**No. 634. Machinery of various kinds.**—Sealed proposals will be received at the office of the United States Reclamation Service, Elephant Butte, N. Mex., until June 20, 1912, for furnishing ball mills, tube mills, a rock crusher, a rotary dryer, and a mixing and weighing machine, for a sand-cement plant on the Rio Grande project, New Mexico-Texas. For particulars address the United States Reclamation Service, Elephant Butte, N. Mex., or Washington, D. C.

**No. 635. Subsistence stores.**—Sealed proposals will be received at the Marine Hospital, Baltimore, Md., until June 14, 1912, for furnishing subsistence stores, etc., including gas, water, telephone service, fuel, etc., required at the hospital during the fiscal year ending June 30, 1913. Specifications can be obtained from the medical officer in command at the hospital.

**No. 636. Distilling plant.**—Sealed proposals will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 22, 1912, for furnishing and superintending the installation of a 25,000-gallon quadruple-effect sea-water distilling plant, with all its appurtenances, in connection with the central power plant at the naval station, Guantanamo, Cuba. Plan and specifications can be obtained on application to the bureau.

**No. 637. Supplies for lighthouse.**—Sealed proposals will be received at the office of the Lighthouse Inspector, Tompkinsville, N. Y., until July 2, 1912, for furnishing the following supplies for the fiscal year ending June 30, 1913: Brushes, chimneys, dry goods, engineer stores, packings, flags, hardware, fire hose, rubber fire and steam hose, nozzles, tool steel, cold-rolled steel, lumber, lamps, mixed paints, paints and oils, varnishes, ship chandlery, tin cans, brooms, wicks, blocks, brass rod, sheet brass, brass tubing, copper sheets, wire, tubing, brass castings, sheet metal, iron castings, ammonia, denatured alcohol, glycerin, sal soda, asbestos cement, Bon Ami, Sapolio, soap, barometers, clocks, boat compasses, time markers, buff skins, machine wipers, candles, lubricating oils, charcoal, American Portland cement, coal bags, cotton waste, mats, corks, packing tow, iron, steel billets, sheet steel, linseed oil, turpentine, mattresses and pillows, matches, rubber sheet packing, crash, red and white lead, zinc, shellac, yellow metal, etc.

**THE CONSUL AND THE TRADE OPPORTUNITY.**

[From Consul James Oliver Laing, Malta.]

It would be a good plan for American merchants to notify consuls of successful trade opportunities. This would have the effect of keeping the consul in touch with the local merchants who are introducing lines of American goods. It also happens very often that a merchant who introduces one line of American goods follows it with another. These are the men the American consul ought to know, and this is especially true of a district where the merchants have the habit of using the consulate catalogue and sample room, as they do here.

Notifying consuls of successful trade opportunities would also reversely give them a knowledge of the failure of trade opportunities in certain lines and would lead to an investigation that might clear away the difficulty. It took me 9 or 10 months to find out that, although several trade opportunities in a certain line had been published in Daily Consular and Trade Reports and many letters had been written to the consulate by American merchants, no sales were being made. Inquiry at the store of a friend revealed the fact that credit terms for Malta were being based upon credit terms offered in the United States and the time extended was too short.

A little advice to the local merchant, who knew nothing of American business methods, brought about further correspondence between him and the manufacturer, with the result that two large orders for the American product were given. The goods were a success, and a rival merchant was forced to order a stock of similar wares in the United States. If it had been evident that no business was resulting from the trade opportunities because of the fact that I was getting no notices of success, I would have known months earlier that something was wrong.

The knowledge that trade opportunities are successful would also act as a stimulus to the consul toward still greater effort. The notices from American merchants would of course be confidential and be part of the archives of the consulate. The consul does not necessarily have to follow up information received in these notices by action suggesting the commercial traveler. There are many ways of avoiding that.

---

**LOADING MARKS ON SEAGOING VESSELS.**

[From Consul John F. Jewell, Vladivostok, Siberia.]

The following is a translation of a letter received from the office of the chief of the Vladivostok trading port, regarding the loading marks on seagoing vessels:

According to the requirements of the law of October 31, 1909, relating to commercial navigation, and "Rules regarding the examination of seagoing commercial vessels" confirmed by the Minister of Trade and Industry November 23, 1911, it will be required from all seagoing commercial vessels (with the exception of purely traders), together with other stipulations of the said regulations, that the loading marks of the deepest draft of the vessel are to be placed on both sides of the vessel. The correctness of the loading marks so placed must be confirmed by a certificate issued by the proper authorities, which is to be kept on board.

## HOW TO INCREASE AMERICAN TRADE WITH TRINIDAD.

[From Consul Franklin D. Hale, Port of Spain.]

Notwithstanding American trade with Trinidad, with its population of 335,000, is growing in importance (amounting in the year 1911 to more than \$9,700,000, or nearly 30 per cent of the island's total trade), still, because of the advantages of location and transportation facilities with the principal American ports, it would seem that it might easily be materially increased if American manufacturers and exporters would energetically use the means at their command toward that end.

This existing trade has been in process of building for many years; and while it is probable that some credit can justly be given to the catalogue and advertising system, a larger degree of credit is probably due to the work of active, faithful, and discreet traveling agents who have, with more or less regularity, although usually at very infrequent periods, visited Trinidad as one of the places in their South American itinerary.

This course may have brought about the beginning of trade in many lines and continued it if conditions resulting therefrom proved satisfactory; but there have undoubtedly been not a few instances where there was some dissatisfaction, and the trade was lost because of the inability of the salesman to repeat his visit in a comparatively short time when the differences could have been explained; or where correspondence by mail very naturally failed to bring the purchaser and seller together to the extent of continuing the friendly trade relationship. In the meantime some competitor happened along and took advantage of the opportunity and the trade which might have been continued to the American exporter went to some other country.

### Cooperation Among Noncompeting Lines.

I have more than once advised that manufacturers or exporters in noncompeting lines could unite in the employment of an able traveling representative, and thus satisfactorily cover the field, when,

for the several individual lines separately, the expense might not be warranted by the possible trade to be gained.

To make this market more valuable to the American manufacturer, I earnestly suggest for careful consideration the system of establishing permanent agencies, believing that this field is large enough to warrant such action. Such a system might not offer equal opportunities to all classes of goods, but that it would be successful in many lines of trade if properly organized and managed I have little doubt. Repeating the suggestion just made as to commercial travelers, several houses not feeling able to test the experiment alone might unite in establishing an agency for noncompeting goods, placing it under the management of the right kind of an American with locally employed assistants.

In this way the local trade of Trinidad would not be lost through neglect or the lack of frequent intercourse between seller and purchaser; and further, if the development of the business should warrant it, subagencies could be established in other West Indian islands and possibly in the adjacent territory of South America.

The Orinoco region of Venezuela, with its undeveloped wealth and possibilities, as well as the nearer districts of eastern Venezuela, reach the outside commercial world to a great extent through Trinidad, the transshipment trade being very large. With its present transportation facilities to and from New York, Boston, and Gulf ports Trinidad could well be made a distributing center, because of the weekly sailings from this port of the boats of the Royal Mail Steam Packet Co. to the other West Indian islands and the regular weekly communication with Ciudad Bolivar on the Orinoco.

#### **Advantages of Personal Representation.**

I believe a well-organized system along these lines would in many cases work out satisfactory results in a reasonable space of time. It is an established commercial principle that an active man on the spot can, by personal influence and presentation of goods, create a demand that was not previously realized and which catalogues and long-distance correspondence would not bring to life. And often, after the demand is created, it requires to be kept alive by active nourishment administered more frequently than once a year, or possibly a longer time, as has occasionally come to my notice while talking with American commercial salesmen calling here on their South American itinerary.

I am well aware that many American manufacturers are now, and have been for years, represented here in the sale of their goods by old established houses and through them enjoy a profitable trade. These are generally large houses doing a general importing and exporting business, and they are not confined to their American connections but often hold agencies in the same line of goods from other countries, or simply carry in stock similar goods from various manufacturers in different countries, possibly, and sell what is called for without pressing to the front any special brand or make. They are not so situated, therefore, as to actively push any special line beyond, possibly, a special short-time advertisement in the local papers. They do not in any sense "drum" the trade as it is understood in the United States. They are all highly honorable and responsible houses, but they have a diversity of interests, and any special line

of trade, because the chief purpose and effort do not center in it, is liable to suffer.

#### **Some Concrete Examples.**

To illustrate somewhat the principle involved herein I cite some concrete instances which have come to my attention during the past year.

A little over two years ago a genuinely alive American representing an oil company visited Trinidad and established a branch for the firm's business. Previous to that time these goods had been handled here by a most reputable house in connection with many other lines of merchandise, but the stock carried was small and no special efforts were made to increase the trade. Some of the large dealers imported direct. The new representative at once procured a suitable location for an office and warehouse for a small supply, with opportunity for enlarging when the need should be felt. He employed necessary local assistants and applied himself to studying the needs of the trade and the business customs and peculiarities of the business men with whom he hoped to do a profitable business. It can not be said that he entered a field where, from the first, he had to contend with energetic competitors, although there were obstacles to meet and overcome.

The results of establishing this branch here are very marked. Not only has the business nearly doubled in less than two years, but it has been broadened to include not only all kinds of oils manufactured by the company, but also gasoline, naphtha, lamps, lanterns, candles, oil stoves, etc. In some of these lines the goods were practically new to this district, but, being on exhibition and actively and personally advertised, a good demand is being created and sales are multiplying. Especially is this true of oil stoves. They were hardly known here until this trade-expansion movement by the company. I am informed that the company is considering making this a distributing center to subagencies in the other West Indian islands and near-by districts in northeastern South America.

#### **Success of a Sewing-Machine Campaign.**

Another instance of the success of a locally established agency and warehouse is that of a sewing machine company. Previous to 16 months ago, sewing machines of half a dozen of the best known makes were carried in stock by several of the leading stores in Port of Spain, but they were nearly all cheap hand-power machines selling for \$5, \$6.50, \$7, and \$9. It is estimated that at that time about 900 of the machines under discussion found an annual market here; 95 per cent of these were the cheap machines.

In January, 1911, the company sent to Port of Spain an American who had been with it for many years and who knew the business in all its details. A most favorable location was secured for office and wareroom; necessary help was employed, and proper advertising displayed to attract the public. As soon as needed, men were educated to drum the city trade, and later the country districts were visited, and this custom is being continued with energy.

The machines are sold mostly on the weekly installment plan of payments, and I am informed that comparatively few have to be taken back for nonpayment. The increase in the business has been very satisfactory. In 1911 over 1,200 machines were sold, all cabinet

styles, the prices ranging from \$21 to \$67, and averaging a little less than \$30. It was the purpose to sell in this market a higher grade of machine without decreasing the number sold, and the object has been fully achieved by this local agency.

It is now the further purpose of the company to extend the business from this center to other West Indian islands and the adjacent districts in Venezuela and Demerara.

**Others Could Do as Well.**

These are marked instances of what has been done in Trinidad by establishing agencies for the display of goods and earnestly working for the trade. Possibly there are reasons specially favorable to these companies for embarking in such an enterprise, but I am reasonably sure that other American manufacturers could with profit investigate this market with a similar plan in view. And for those who do not dare venture along these lines I am confident that greater profits could be enjoyed on an enlarged business if commercial travelers of tact, character, and business skill were given a field in this section which could be covered every three months, and seller and purchaser thus be brought together more frequently than has been the custom in the past. Undoubtedly trade which might be enjoyed by American exporters is now lost to them because this market is not more thoroughly studied and understood and the trade more frequently visited by competent men. Many of the larger mercantile houses doing business with America make their purchases through New York commission houses, but I feel assured that commercial travelers personally representing goods here would effect much larger sales in numerous lines.

---

**CONSULAR TRADE CONFERENCES.**

Consul Robert J. Thompson, of Hanover, Germany, announces that he expects to arrive at New York on June 14, 1912, on leave of absence for 50 days. His address while there will be the Waldorf Hotel. His permanent address while in this country will be Masonic Temple, Chicago, Ill.

Consul James Verner Long, of Venice, Italy, expected to arrive in New York about June 10, 1912, on leave of absence for 60 days. His address for five days in New York will be at the Imperial Hotel. His permanent address while on leave will be 5530 Howe Street, Pittsburgh, Pa., where business men or organizations interested in commercial and industrial conditions in his district may address him.

Consul Franklin D. Hale, of Port of Spain, Trinidad, British West Indies, advises that he expects to arrive in New York on July 17 on leave of absence for 30 days. He will be in New York City for two days, and may be addressed by business men at the Grand Union Hotel. The next two days he expects to spend in Washington, after which he will proceed to Vermont for the remainder of his leave, where his address will be Lunenburg.

---

*Maltese public conveyances.*—Consul James Oliver Laing has forwarded a photograph of the type of public conveyances in use in Malta. The price of such a vehicle, which is called a "carrozzin" in Maltese, is about \$175. Private carriages, the consul states, are generally in the Paris and London style. The photograph referred to will be loaned, upon application, by the Bureau of Manufactures.

**CONSTRUCTION WORK ABROAD.****MEXICO.**

[From Consul Philip E. Holland, Saltillo.]

**Building Construction on Mexican Plateau.**

The walls of Mexican buildings of the great central high region are chiefly of adobe covered with plaster and are too soft to retain permanently driven nails. This condition is avoided in the case of wainscoting, door facings, baseboards, etc., by inserting wooden studding with the outside surface left flush with the wall, to which the other woodwork is nailed.

The ordinary construction in this district is the adobe. This is a sun-dried brick of various dimensions; the largest size being 14 inches wide and 3 inches thick. Formerly they were made 4 inches thick. The earth from which they are made is strongly impregnated with lime. It is pulverized with a heavy hoe and water added. When brought to a proper consistency straw is added. This mass is then molded in a wooden frame and when sun dried is ready for use.

The cost of making adobe ranges from \$3.75 to \$6.25 (gold) per thousand. Masons charge \$5 to \$10 (gold) per thousand for laying them in the wall. When properly made and laid they last indefinitely. There are adobe houses in Saltillo that have been in use for over 150 years.

In adobe houses the wall finish is a cheap plaster made of fine sand and locally burned lime. It is then given a finish of whitewash; usually coloring of various tints is added, the popular taste running to a display of lines and figures.

**Wall Finish—A Concrete House.**

The ceiling is usually made of cloth. This comes in bolts containing 25 meters (27½ yards) in length and about 60 centimeters (23½ inches) wide, the cost per bolt ranging from \$1.35 to \$1.75 (gold), depending upon the thickness of the texture. The cloth is finished in the same design as the walls.

In the more expensive adobe houses oil is used in place of lime, and in many instances the painting is quite elaborate, going into intricate figures and landscapes. A few walls are finished in American wall paper. On a very few alabastine has been used.

There are a number of stone and brick buildings in this city, some of them of recent construction and built on modern lines. These have walls artistically decorated as described, the cost depending on the materials used and the elaborateness of the designs. Most of the interior wall construction is solid, and very little lathing is used. It is my impression that laths are not offered in the lumberyards here.

There are no entirely wooden constructed houses in Saltillo. There are a few ironclad with wooden finish inside. There is one concrete house in this city; it is quite pretentious, and is nearing completion.

**Cost of Materials—Duties on Wood.**

Native lime is delivered at the place of construction at \$4 to \$6 (gold) per ton. Sand is delivered at \$1 to \$1.50 (gold) per ton. Carpenters, painters, and masons earn 50 cents to \$1.25 (gold) a day, and their helpers 31 to 37 cents a day. Eleven hours constitute a day's work. This appears to be very low wages; when, however, the labor

conditions are taken into consideration they about equalize the cost and result with labor in the United States.

Generally the construction is of solid materials from interior to exterior without any studding or partitions between the walls. A few modern structures have studding in their partitions.

Common building wood is exempt from duty under article No. 146 of the Mexican tariff. Explanatory note No. 69 excepts wood sawn into thin sheets and wood cut, perforated, or wrought in any way so as to fit it for some definite object. Wood that has been planed, grooved, or dovetailed is also excepted. Common wood when planed and wrought into dovetailed boards carries a duty of 5 cents (gold) per 100 kilos (220.46 pounds). If it is sawn into thin sheets it is dutiable at the rate of 55 cents (gold) per 100 kilos.

[From Deputy Consul General John C. Allen, Monterey.]

#### **Use of Sillar Bricks Finishing Materials.**

In the construction of large buildings in Monterey structural steel and concrete has of late been used to some extent. Brick is used considerably for city buildings and private residences.

The building material most used is the "sillar," which is found only in certain parts of Mexico. Sillar consists of blocks of hard compact clay about 3 or 4 feet square. These blocks are cut out of the solid clay ground in the same manner as ice is cut from ponds, lakes, and rivers in the cold north, and are used for building purposes without further preparation. The sillar should not be confused with the adobe, which is used very little here, as sillar is cheaper. In some parts of the country there is another building material called "tepetate," which is similar to the sillar. Mexico has many mines of beautiful building rock of different colors, which is used to some extent for large and costly buildings, theaters, statehouses, etc.

Sillar is used for side, end, and interior walls. The exterior walls are plastered and whitewashed any color to suit the taste. Interior walls are plastered and whitewashed or painted. The painting is generally an imitation of wall paper. Wall paper is sometimes used instead of whitewash or paint, but very rarely. No studding is used in the walls; it would involve considerable extra expense, as lumber is very high in price. The sillar will not hold nails. There is absolutely no woodwork in the walls except for the doors and windows. Floors are made of cement or tile.

The roofs of buildings in Mexico, with few exceptions, are flat. Strong wood rafters are placed with ends resting in the walls about 2 feet below the top of the wall. A tight board floor is laid over the rafters. This floor is covered over with 6 to 10 inches of clay or cement, or both. Holes, water drains, are made through the walls at the top level of the roof. The roof of a building resembles a great open box without cover. The walls of the average dwelling are about 18 feet high, which makes 15 feet from floor to ceiling, inside, 1 foot for ceiling, rafters, and roofing, and 2 feet projecting above the top of the roof.

The ceiling most used is strong canvas cloth nailed to the rafters. The canvas is sometimes whitewashed; others paint it with water or oil colors, while some have their ceilings decorated with all kinds of fancy designs and landscapes at a cost of hundreds or thousands of dollars. Many prefer no ceiling at all, painting the rafters instead.

## CANADA.

**Plans for Hudson Bay Terminals.**

Several corps of Canadian engineers and surveyors are going to Port Nelson and Port Churchill, and work will continue all next winter on Hudson Bay terminals for the new railroad. In the meantime a decision will be reached by the Dominion Government as to which of these ports will be selected. A dispatch from Ottawa states:

Supplementary estimates provide \$2,000,000 for starting the terminals, building docks, elevators, etc., so that the Government has provided sufficient money to be able to rush forward the work. It is the ambition of the Cabinet to have the Hudson Bay line ready to help move the crop of 1913. But a road is of no value unless the terminals are also completed, and for this reason this work is also being rushed. By the time the line reaches the bay it is hoped to have everything in readiness for a steamship line running to Great Britain.

---

**THE NETHERLANDS.**

[From Consul General S. Listoe, Rotterdam.]

**Manner of House Construction—American Finishing Materials.**

Holland in general lies about 3 feet below the level of the sea, the whole country being protected from the sea by dikes; in consequence of which the climate is very damp and moist, while the soil is quite light, though rich, and, owing to so much moisture, rather soft. As a result of these climatic conditions, it has been found necessary, in constructing buildings, to drive many wooden piles (about 50 feet in length and 1 foot in diameter) into the ground, upon which a plank foundation is laid. This is done to prevent the walls from settling and cracking, but, even in spite of the fact that oftentimes thousands of these large piles are used in one building, few, even of the modern structures, are finished with plastered interior walls such as are so common in the United States.

The walls of the Dutch buildings are universally of brick throughout (solid material from the interior to the exterior without any studding or partitions between the walls); as a substitute for the American stud-dings (2 by 4's)—built against the brick walls—and upon which the laths are nailed—a wooden frame is here constructed, also against the brick walls, over which a coarse cloth is stretched, and upon this cloth the wallpaper is then hung. This makes a very satisfactory, cheap, and well-appearing wall and seems to answer the purpose in every way. The cost of these walls depends, of course, upon the quality of cloth and paper used, but they can be constructed at a much less expense than American plastered walls.

The ceilings are constructed somewhat different than the walls and proportionately at a greater expense. In place of laths, as used in the United States, dry reeds are fastened to the beams, upon which a thick layer of plaster is spread; this is then either painted artistically or decorated with flower or other designs and finished with a coat of "whitewash," presenting in general a very attractive appearance. It is rather uncommon to paper the ceilings in Holland, which are universally finished in a "whitewashed" condition.

I see no particular reason why American wall-finishing devices could not be successfully introduced into the Netherlands, but, as a prominent Rotterdam dealer in building materials states, it might take some time to produce the desired result. It is rather difficult

to change old established European customs; this must be accomplished gradually. If a few of the most prominent architects and dealers in building materials here were interested they would be able to give aid in the introduction of American building materials into Holland. To this end a list of important Dutch architects and dealers in building materials is forwarded [and may be had from the Bureau of Manufactures at Washington].

---

#### SWEDEN.

[From Consul General E. L. Harris, Stockholm.]

##### Many New Municipal Buildings.

Notwithstanding the depression existing in the building trade in Stockholm during the past year, and which exerted an influence upon private enterprise to such an extent that little has been done, the municipality has constructed a number of fine, large public buildings. Many have also been projected for the near future. The new police headquarters building completed last year cost \$900,000. A new municipal house is also being constructed, at a cost of \$950,000. A new town hall is being planned which will cost \$2,000,000.

The Stadium, in which the Olympian Games will be held this summer, has just been completed, at a cost of \$266,000. It has seating accommodations for about 25,000 spectators.

A new market hall has also been erected, at an expense of \$200,000. The Engelbrekt Church, commenced in 1910 and which will be completed in 1913, is expected to be the finest church in Stockholm as regards architecture. It will cost \$350,000.

Last year a new street in Stockholm was completed which cut through the heart of the city. A good portion of it was blasted out of a ridge, at an expense of \$1,800,000.

A proposal is now being entertained to build an underground railway from the Stadium to the central railway station and from thence to the west end of the city. The cost is estimated at \$3,800,000.

##### Other New Structures and Harbor Works.

While private enterprise was slack during 1911 some large corporations made various improvements. The Grand Hotel, considered one of the finest in Europe, completed a new addition early in 1911. The large and commodious Strand Hotel has just been completed. Two large banking establishments have started building large and handsome structures. It is also proposed to build a new house for the Nobel Institute.

During 1911 the harbor of Stockholm has been extended and improved, while a number of large modern warehouses have been erected along the different quays.

---

#### BRITISH INDIA.

[From Consul Edwin S. Cunningham, Bombay.]

##### Railways in the State of Bhavnagar.

The 36-mile Dhasa-Kundla Railway, built at a cost of \$422,000, was formally opened on May 16, 1912, by the Governor of Bombay. It is located in Bhavnagar (a Native State of 2,800 square miles and 400,000 population on the west coast of India), and its opening is another evidence of the progressive policy of developing its com-

mercial and industrial resources. In the address of the Maharaja of Bhavnagar at the opening he stated:

Two new projects have been recently commenced, with the sanction of the Government, the Botad-Jasdan connection of 34 miles, and the Kundla Mahuva link, 36 miles. When these three schemes are completed, I shall have added 122 miles to the State's railway system, at a cost of \$1,394,920, which, with the outlay on the main line, will bring the total railway investment of the State to \$4,161,120 for an aggregate of 242 miles of line. But these works do not exhaust the possibilities before us. I have in view a scheme for constructing a steam tramway to connect all the important district towns of my State which are not served by the existing system, and this will mean the laying down of another 90 miles of line.

This indicates some of the proposed plans in this Native State. It is impossible to ascertain exactly the present status of the schemes outlined, but sufficient is revealed to indicate the possibility of trade in articles necessary for the fulfillment of these projects.

#### Opening of Waterworks.

On the same day the Victoria Jubilee Waterworks were inaugurated in the final stages. For the city of Bhavnagar the additions and improvements—

Comprise the widening and regrading of the supply channel, so as to increase its capacity fourfold; the provision of automatic gates at the storage lake, which will give an additional 3 feet of head and raise its capacity by 50,000,000 gallons; the construction of five filter beds with an aggregate of 3,000 square yards; the erection of two covered pure-water tanks estimated to hold a full day's supply for the town; the installation of pumping plant in duplicate with a high-level service tank; and the laying of 10½ miles of distributing mains. These have cost \$150,000, which, added to the outlay on the earlier works, have raised the total expenditure on the water supply of the town to \$422,000.

#### CEYLON.

(From Consul Charles K. Moser, Colombo.)

#### Completion of the Colombo Breakwater.

The final stone in the completion of the southwest breakwater of Colombo Harbor was laid on May 1 by Sir Henry McCallum, governor of Ceylon. With the addition of this protecting arm the artificial construction of Colombo Harbor is at last completed, at a cost of approximately \$15,000,000. The work was begun in 1875, when the late King Edward VII, then Prince of Wales, laid the first block of the southwest breakwater. The work was projected by Sir Hercules Robinson, then governor of the colony, designed by Sir John Coode, and executed by John Kyle, who completed the southwest breakwater in 1885. Subsequently a breakwater to the northeast, sheltering the harbor from the northeast monsoon, was completed in 1906. The new arm attached to the southwest breakwater is the final protection of the two against the violence of the southwest monsoon.

Before the erection of these breakwaters Colombo Harbor was a mere open roadstead exposed to all the violence of the sea. It is now one of the most commodious and best-protected artificial harbors in the world, being a square mile in area and capable of accommodating 40 to 50 vessels of over 12,000 tons.

It is planned next to dredge a large portion of the harbor to a depth of 36 feet, in order that it may accommodate the largest vessels in the world.

The tonnage figures of Colombo for the first four months of 1912 were 3,437,073, against 3,165,557 tons in the same period last year

and 2,878,835 tons in the 1909 period. The nationality of foreign vessels calling at Colombo January 1 to May 1, 1912, was: German, 91; French, 49; Austrian, 62; Russian, 35; Dutch, 48; Japanese, 32; Spanish, 13; Italian, 8; Norwegian, 14; American, 1. The Hamburg-American liner *Cleveland* arrived with 500 tourists from San Francisco on April 17 and sailed on the 19th for Bombay.

### FASTER RAILWAY SERVICE IN CHOSEN (KOREA).

[From Vice Consul General Edwin L. Neville, Seoul.]

The Director of the Railway Bureau of Chosen (Korea) in a press interview says that after the revision of the existing time-tables this month of June the time between Tokyo and Seoul will be shortened by four hours, and after the inauguration of the through express service between Fusan and Changchun, in the near future, the bulk of the trans-Siberian travel will join the Russian railway at Changchun, instead of Vladivostok, as at present.

The director lays particular stress upon the present outlays for railway building and improvement of rolling stock. He states that the amount appropriated for this work amounts this year to \$4,482,000. It is anticipated that a large section of the Seoul-Wonsan line will be completed during the current year.

New passenger cars of the latest style, new engines of greater speed, and other railroad equipment are being ordered. In this connection manufacturers of American railway materials have representatives here.

### COMPETITION FOR MOTORS FOR AEROPLANES.

[From Consul General James A. Smith, Genoa, Italy.]

A report from this office in Daily Consular and Trade Reports for May 4, 1912, called attention to the formation of a National Aero League in Italy and the donation of a fleet of 100 aeroplanes to the Italian Government. Another report in the issue for April 23 called attention to a military aeroplane competition organized by the Italian Ministry of War. The ministry has now made arrangements for a second competition to be held for motors for aeroplanes. The competition is for motors for military aviation. The first prize will be \$15,000, the second \$5,000. Applications will be received until October 1, 1912, while competing motors must be presented by January 10, 1913. [The details as to the competition may be had from the Bureau of Manufactures, Washington, D. C., while additional information may be secured from the Ministero della Guerra, Rome, Italy.]

### Agricultural Leaders in Southwestern Spain.

Consul Charles S. Winans writes that the only agricultural society at Seville is the Camara Agricola de Sevilla, Secretario D. Antonio Lopez Plata. The agricultural schools of the district are (1) Granja Provincial de Alfonso XIII, Director Don Carlos Morales Antequera, at Seville; (2) Granja Agricola Regional Director Don Eduardo Noriega, at Jerez de la Frontera. Other Government agricultural bureau chiefs in this section are Don Jose Maria Grande de Vargas, Seville; Don Ciriaco Iriarte, Cadiz; Don Alberto Castineyra, Cordoba; Don Andres Buisan, Huelva, Spain.

## FLAX CROP IN CANADA.

[From Consul General John G. Foster, Ottawa; supplementing article in Daily Consular and Trade Reports for Nov. 21, 1911.]

It has been ascertained that the yield of flaxseed in the northwest Provinces was 5,054,000 bushels less than the estimate reported at the end of December. This was in a large degree due to the unusually rainy autumn, which prevented the curing and housing of much grain. Large quantities of flax were destroyed while standing, and much that was cut could not be got into condition for thrashing. The revised yield and value of flaxseed in 1911 is therefore now given by the Census and Statistics Office as follows:

Province.	Acreage harvested.	Yield in bushels.	Value.
Quebec.....	1,719	19,000	\$32,000
Ontario.....	8,367	118,000	223,000
Manitoba.....	62,231	899,000	1,582,000
Saskatchewan.....	570,030	6,413,000	9,639,000
Alberta.....	40,275	418,000	502,000
Total.....	682,622	7,867,000	11,855,000

Unrevised official statistics place the Dominion's exports of Canadian flaxseed during the 12 months ended March, 1912, at 1,504,528 bushels, valued at \$2,842,242. These shipments were distributed: Great Britain, 495,496 bushels, value \$1,004,888; United States, 991,802 bushels, value \$1,802,894; Belgium, 16,290 bushels, value \$32,580; other countries, 940 bushels, value \$1,880. There were also exported during the same period 6,958 hundredweight of flax, worth \$72,191, of which 6,510 hundredweight, value \$70,266, went to the United States.

## BRITISH INDIA NOTES.

[From Consul Stuart K. Lupton, Karachi.]

*Freight cars.*—The Northwestern Railway has been authorized to purchase in Great Britain 1,000 covered goods cars.

*Railway gauge.*—The Government is taking steps to "resume" from the Karachi Port Trust 52 acres of land required for the termination of the meter-gauge railway. This is taken to imply that the meter-gauge connection between Karachi and Hyderabad, by which the whole of the Rajputana-Malwa railway system will get a maritime outlet, is becoming a possibility.

*Motor car and motor cycle imports into India during the years 1909-10, 1910-11, and 1911-12* are reported as \$1,540,900, \$2,376,230, and \$3,252,110, respectively. Of the imports for 1911-12, \$2,514,100 worth are credited to Great Britain, but a large number of the cars represented thereby were in reality of foreign manufacture. Three Ford cars (American) were put into use in this city in April.

*The great Sind irrigation project* is again under consideration by the Government of India. The present proposal is to construct a barrage at Sukkur and increase the capacity of the Rohri left-bank canal. The proposed outlay is about \$22,000,000. At least three alternative propositions have been proposed during the last three years, with costs as high as \$73,000,000. Lack of money has been largely instrumental for their failure to pass.

**BANKING IN THE UNITED KINGDOM.**

[From Consul General John L. Griffiths, London.]

In a recent issue of the Statist, English banking conditions are comprehensively reviewed and a short history of many of the principal banks of the United Kingdom is given. The following facts are gathered from the general survey of banking conditions in the article:

The annual income of the United Kingdom is now in the neighborhood of \$10,949,625,000, of which the annual addition to the nation's wealth or capital fund is about \$1,703,275,000. The whole of this income passes through the hands of bankers in the course of the year, and the amount of bankers' funds at the close of the year is merely the balance after all the year's expenditures have been met and all the permanent additions to wealth have been effected.

Experience shows that bankers' balances, the floating capital of the nation, increase in proportion to the growth in savings and in wealth; but it should be clearly understood that the increase in bank deposits and in bankers' funds is only a small portion of the supplies of new capital annually available for the increase of production. In comparing the growth of deposits and of banking funds in this country with the growth in other lands it is especially necessary to recollect this fact. Here the greater part of the permanent capital provided for our industries and for the expansion of our trade is found by the issue of permanent securities, and only a small part is supplied from banking funds. In other countries depositors, instead of purchasing permanent securities, leave their savings with bankers for much longer periods, and a larger portion of the capital needed for the extension of industry and of trade has therefore to be supplied from bankers' funds. It will be evident that the British is the sounder practice. Savings are used to create fixed wealth, and cash balances are employed to finance consumable wealth.

**Growth of Deposits.**

Last year the amount of capital subscribed for publicly issued securities in the United Kingdom was nearly \$973,300,000; and in the last six years the amount of new capital publicly subscribed in this country exceeded \$4,866,500,000. Over and above the subscriptions to new securities the deposits of bankers last year increased \$170,327,500, and since 1905 the expansion has been \$681,310,000. At no time have banking funds expanded more rapidly than at the present time. In 1911 the increase in deposits was equal to nearly 4 per cent, and in the past six years the expansion has been 16 per cent. If it be recollected that the normal expansion in trade, income, and wealth of this country is about 2 per cent per annum, it will be realized that an expansion of nearly 4 per cent last year in bankers' deposits affords additional testimony to the present activity and prosperity of trade and of business.

The increase in the deposits of British banks since 1895 will be evident from the following statement:

Year.	Number of banks.	Deposits.
1895.....	156	\$3,576,877,508
1900.....	111	4,014,862,500
1905.....	88	4,238,721,508
1910.....	69	4,749,704,000
1911.....	67	4,915,165,000

The notable fact is that notwithstanding the very large increase in deposits the number of banks in 1911 was less than half of the number in 1895. This means that many amalgamations have taken place, the smaller banks being absorbed by the larger institutions. As the practice in the United Kingdom is for the principal banks to have many branches it does not signify that the reduction in number means any curtailment of banking facilities; and that indeed is not the case, because the number of banking offices is constantly increasing. To-day there are nearly 8,300 such offices, or double the number a quarter of a century ago, and more than four times as many as 50 years ago.

**Assets and Liabilities.**

At the close of 1911 one bank had deposits of \$408,786,000, and 631 branches; another bank had nearly \$403,919,500 deposits, with 344 branches; a third had deposits approximating \$379,587,000, with 716 branches; while a fourth had 371 offices and \$306,589,500 of deposits. Not many years ago the deposits of the Bank of England were far in excess of those of any other banking institution, but at the end of December last, with deposits of \$296,856,500, it ranked only fifth.

The aggregate liabilities and assets of all the banks of the country which publish accounts are set out below:

Liabilities.	Amount.	Per cent of total.	Assets.	Amount.	Per cent of total.
Capital paid up.....	\$405,943,964	6.6	Cash in hand, at Bank of England, etc.....	\$716,523,994	11.9
Reserve funds.....	235,324,474	3.9	Money at call and at short notice.....	716,523,994	11.8
Total.....	641,268,438	10.5	Bills discounted.....	758,624,085	12.5
Notes in circulation.....	213,055,370	3.6	Investments.....	1,165,298,025	19.2
Acceptances.....	244,424,829	4.2	Advances.....	2,350,490,301	38.7
Deposits and current accounts.....	4,948,685,452	81.3	Liability of customers for acceptances.....	244,424,829	4.0
Profit balance.....	29,529,922	.4	Bank premises, etc.....	125,078,783	2.0
Total liabilities.....	6,076,964,011	100.0	Total assets.....	6,076,964,011	100.0

More than 56 per cent of the income of bankers of the United Kingdom was derived in 1911 from advances to private customers, 22 per cent resulted from investments, 12 per cent was obtained from bills, less than 9 per cent from money at call and short notice, and 1 per cent from acceptances.

**Income and Profits.**

The gross income in 1911 of those banks which publish data was:

Assets.	Amount.	Rates of interest in 1911 per \$100.00.	Gross income.
Cash in hand, at Bank of England, etc.....	\$716,523,994	Nil.	Nil.
Money at call and at short notice.....	716,523,994	\$10.70	\$15,782,503
Bills discounted.....	758,624,085	14.11	22,001,446
Investments.....	1,165,298,025	17.03	40,786,136
Advances.....	2,350,490,301	21.73	101,855,845
Liability of customers for acceptances.....	244,424,829	3.65	1,829,805
Bank premises, etc.....	125,078,783	Nil.	Nil.
Total.....	6,076,964,011	14.60	182,235,825

English bankers last year obtained an all-round return of a little more than 3 per cent on the money left with them for employment, "as capital, reserves, or deposits." After deducting the interest paid to depositors, the gross profit was somewhat over 2½ per cent. The expenses of the bankers in 1911 were about \$63,264,500. The amount of profit available for dividend and for reserves was \$67,055,503, to which must be added the income tax either deducted from the gross profit or charged to expenses and which amounted to \$4,155,991. The total profit of British banks in 1911 was therefore \$71,211,494, which was equal to a return of 17.54 per cent upon the paid-up capital, 11.11 per cent on capital and capital reserves (the real capital employed), and only 1.17 per cent on the total funds employed.

**GROWTH OF AUSTRALIAN FOOD EXPORTS TO CHINA.**

(From Consul General George E. Anderson, Hongkong.)

One of the features of trade along the coast of southeastern Asia is the growing importation of many varieties of goods from Australia. The change has been notable, particularly within the past three years, and relates largely to food supplies of various sorts. It is worthy of remark that the supplies now coming from Australia are similar to goods produced by the United States and exported to some extent to various other portions of the world.

Australian meats and meat products have met with increasing sales in Hongkong and Chinese ports, the Philippines, and the East Indies for several years. There is considerable trade in fresh meat, including beef, mutton, and pork, and there is a growing demand for Australian hams and bacon, lard, game, poultry, and various other meats.

**Meats, Fish, and Dairy Products.**

In the fiscal year 1911 the Philippines took \$5,327,159 worth of beef from Australia, out of the \$5,479,104 worth imported, and the record in other fresh meats and game was similar, Australia furnishing \$5,850,440 worth of fresh meat of the \$6,031,359 worth imported. In ham and bacon Australia does not do so well; but its trade in these meats is mounting rapidly, and their importation into Hongkong affects American interests in that most of such imports heretofore have come from Great Britain and consisted very largely of American pork shipped in brine to England and there cured for the British trade.

Australian fish, generally cured in imitation of British brands of smoked fish, are coming into this market to a greater extent each year and bid fair to dominate the trade in another season or two. The goods are not quite up to the quality of the original, but the quality is very fair and the difference in price in favor of the Australian product is convincing. Fresh frozen fish, particularly salmon and similar varieties, are brought here in increasing quantities.

In fresh dairy products, also, Hongkong and most of the lower Asiatic coast and the East Indies are now supplied from Australia. Australian butter controls the situation to the exclusion of all other on the lower coast and of most other such products on the northern coasts, although five years ago the United States had the greater portion of this fresh-butter trade. Australian cheese, generally made in imitation of well-known English varieties and of very fair quality, is being imported in increasing amounts. Some cheese is brought from the United States and Canada, and American cheese, within the limits of its possible use here, is popular.

**Fruit, Jams, and Honey.**

Apples from the Pacific coast furnish the imports of such fruits during most of the year, but the Australian fruit supplements this supply, and imports are increasing yearly.

Perhaps one of the most significant features of this trade is the manner in which Australian preserves, jams, and similar goods are supplanting the products of other countries. For many years certain brands of jams and preserves have been sold here, as elsewhere in the world, as representative of a great British industry. Of late,

consumers have complained that the quality of these goods has deteriorated; but whether this is the case or not, Australian preserves and jams are being sold in direct competition with the English products and are capturing more and more of this business. American jams and preserves have never been able to get into this market to any considerable extent. Cheap American goods of this sort have not attracted British buyers, who have been accustomed to British wares, and the finer grades have been too expensive. That Australian preserves and jams have been able to enter this field, however, indicates a growing possibility of American trade in such goods here. It may be well to note that one of the comparatively few lines of trade in which American packing is still the subject of complaint is jams, preserves, and fruits in glass.

Australian honey is being sold in increasing quantities in Hongkong and the China coast ports. It comes into direct competition with California honey and has undoubtedly taken trade which, under other conditions, would have gone to the United States. The Australian honey is not of so good a quality as the California product and is not preferred by the fine trade, but it is about 25 per cent cheaper at present and is a fair product for the prices asked.

#### Competition of Australian Flour.

In some respects the most serious phase of this increasing Australian trade in its relation to the United States is that of flour. During 1911 Australia sent into Hongkong a total of 162,858 bags of flour, and Australian shipments of this commodity to Chinese ports direct were larger than ever before, the total supply from that Commonwealth for this part of the world exceeding all previous records, with the exception of the famine year 1907, when Hongkong took over a million bags of this flour.

Flour exports from Australia at the present time are particularly important to the United States in that they are going into the Philippines, the East Indies, and some portions of China, as well as to Hongkong; and are therefore supplying markets which have heretofore drawn upon the United States almost exclusively. How serious this competition is to become is yet to be seen, but the fact that the growth of late years has been steady and apparently not caused by other than normal conditions gives some promise of its permanence.

---

### INDIA NEEDS COAL-HANDLING FACILITIES.

[From the official Indian Trade Journal, Calcutta.]

The committee of the Bengal Chamber of Commerce has addressed the Secretary to the Government of India, Department of Commerce and Industry, on the question of the deficiency of railroad facilities for the transport of coal. The recommendations of the committee are: (a) That an estimate should be prepared by the Railway Board of the number of wagons that the railways could at present profitably utilize, and that this number—believed by the committee to be about 8,000—should be ordered immediately in addition to the ordinary program; (b) that the question of the provision of a general reserve stock of wagons should be reconsidered; (c) that the question of quadrupling the East Indian Railway from Asansol to Bandel should be examined at once; (d) that the railways, the colliery proprietors, and the Calcutta Port Commissioners should unite in a determined effort to reduce the detentions to which wagons are now subjected, at the collieries, en route, and at the Kidderpur Docks; and (e) that a special officer should be appointed to make an investigation into and to report upon the equipment of the open lines.

## FOREIGN TRADE OPPORTUNITIES.

(Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.)

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 8999. Steel rails, fishplates, and rail rests.**—Supplementing a previous report, an American minister reports that officials of certain foreign railways will shortly invite bids for a large quantity of steel rails, fishplates, and rail rests for use in the construction of roads. Recently a contract was made with certain European contractors to furnish 14,521 tons of steel rails, 1,178 tons of fishplates, and 646 tons of rail rests. The contractors failed to comply with the provisions of their agreement, and the order has been canceled. If Americans can secure this order, an important future market would be opened, as much railway construction is contemplated. Copy of the complete report, giving further detailed information, will be sent to interested firms by the Bureau of Manufactures.
- No. 9000. Electric railway.**—Prominent business men in a country of the Far East are interested in plans for an electric railway which promises to be of considerable importance. The proposed line is to be 35 miles long, but extensions may easily be made to connect other important cities in the country in question. American manufacturers should make a special effort to supply the first materials purchased for this line, as this will likely determine the character of those which will be used in the branch lines to be constructed later. An American consul writes that the promoters of the line would like to receive figures showing in detail the cost of the necessary machinery and equipment. Copy of the complete report will be sent to interested firms by the Bureau of Manufactures.
- No. 9001. Kerosene-oil lamps.**—An importer and commission agent in the Near East has expressed to an American consul a desire to handle a line of kerosene-oil-burning lamps, and he is anxious to receive from firms in the United States prices, c. i. f., discounts, commissions, catalogues, etc. Correspondence may be in English.
- No. 9002. Railway materials.**—A report from an American legation states that certain foreign railway authorities are in the market for material needed for the construction of narrow-gauge lines. Bids are requested for 2,000 tons of rails, 102 tons of fishplates, and 132½ tons of rail rests. American manufacturers are urgently advised to make an earnest endeavor to look into this matter seriously with a view to take advantage of the opportunity offered, as well as the prospects for future orders.
- No. 9003. Bottles.**—An American consul in a Latin-American country has forwarded a copy of a letter from the secretary of an agricultural association in his district requesting to be placed in communication with some bottling works or manufacturers of bottles in the United States. Correspondence should be sent direct to the inquirer, and should be in English.
- No. 9004. Camel's hair shoes.**—The Bureau of Manufactures is in receipt of a communication from a business man in Germany requesting to be put in touch with American manufacturers or exporters of camel's-hair shoes.
- No. 9005. Automatic egg cookers.**—An American consul in a European country reports that a local business man has made inquiry for manufacturers of an automatic egg-cooking apparatus. Catalogues or correspondence addressed to the consulate will be forwarded to the inquirer.
- No. 9006. Self-starting and lighting devices and gasoline tanks.**—The manager of a firm which is the leading dealer in motor cars and maintains a garage in a foreign country informs an American consulate that his firm would like to act as local agent for self-starting and lighting devices; also gasoline tanks for motor cars.
- No. 9007. Agency for American goods.**—A report from an American consul states that a business man in his district desires to act as salesman or agent for different lines of American goods. His chief experience has been as salesman for tobacco, boots and shoes, paints, and plated ware, and in the future he especially desires to handle American products. He furnishes references.

## SCOTCH TRADE AND INDUSTRIES.

### GLASGOW.

[By Consul J. N. McCunn.]

Notwithstanding that nearly all branches of industry in the Glasgow district were more or less affected throughout 1911 by labor troubles, the volume of trade and commerce was fairly satisfactory. This was largely accounted for by the exceptional year's work in the shipbuilding yards on the Clyde, the output of new ships and machinery for the year having broken all previous records. Shipbuilding, coal, and steel are the principal industries of the district and other industries are largely dependent on them. Unless labor troubles develop, still greater industrial developments are expected during 1912.

### Output of Shipbuilding Yards.

The number of vessels built in Scotland last year was 557, with a total tonnage of 671,624, against 450 vessels of 420,250 tons in 1910. On the Clyde, in this consular district, 413 vessels, with a total tonnage of 630,583 were launched, against 358 vessels of 392,392 tons in 1910.

The tonnage launched from the Clyde yards during 1911 was distributed among the various types of vessels as follows:

Type.	Number.	Tonnage.	Type.	Number.	Tonnage.
Screw steamers .....	140	463,425	Tugs .....	9	1,159
Warships .....	11	75,024	Fishing steamers .....	9	1,008
Dredgers .....	19	13,219	Rock cutters .....	6	936
Combination steamer .....	1	12,927	Stern-wheel steamers .....	9	847
Paddle steamers .....	22	12,069	Sailing yachts .....	21	631
Barges and lighters .....	82	9,618	Steam launches and pinnaces .....	17	296
Motor boats .....	46	5,917	Other vessels .....	3	1,391
Hopper steamers .....	9	5,765			
Turbine steamers .....	2	3,351	Total .....	413	630,583
Geared turbines .....	2	3,000			

Notable among the new steamers was one built for the East Asiatic Co., of Copenhagen. This was an oil-engine vessel of 5,000 tons and 3,000 indicated horsepower, and the first of its type constructed on the Clyde. It has three masts, and the fumes from the engine room

are led inside the mizzen mast, and exhausted at a height of 48 feet above the deck, thus dispensing with a funnel, which is not required, even for exhaust purposes. The machinery of the two sets of Diesel oil engines, with which the steamer is equipped, costs about \$20 per brake horsepower more than steam power, approximately \$50,000 more than the machinery of a steamship of the same displacement and power. To offset this extra cost there is 1,000 tons additional cargo space, which it is estimated in two years will cover the extra expense and thereafter represent a large gain. The owners of the vessel reckon that the vessel will save \$25,000 annually in fuel.

#### **Increased Shipping Demand.**

An exceptional demand for tonnage created by the prosperity at Glasgow forced many of the prominent firms to augment their fleets by chartering. Freight rates maintained a higher standard than shipowners had experienced for a number of years, and dock laborers and seafaring men of nearly all classes were paid higher wages, owing to the demand for labor being frequently in excess of the supply. Brief interruptions due to labor disputes arrested the progress of trade at times, and in some instances diverted traffic to other ports.

The aggregate tonnage of vessels using the port for the year ended June 30, 1911, was 12,500,000 tons, an increase of about 144,000 over the preceding year, while the imported and exported goods amounted to about 10,360,000 tons, an increase of 262,000 tons. In the export trade, which was brisk, the heaviest shipments were coal and iron.

#### **Some of the Principal Imports.**

The latest statistics available of the total imports and exports of the port are for the 11 months ended November, 1911, and therefore the following comparison of the trade is for that period compared with the whole of 1910.

The grain imports at the end of November, 1911, amounted to 516,226 tons, against 519,861 tons in 1910. The imports from European ports amounted to 92,656 tons; from North America, 325,543 tons; from Argentina, 19,023 tons; from Australia, 5,691 tons; from India, 59,168 tons; from New Zealand, 2,512 tons; from China, 7,433 tons; and from South Africa, 4,200 tons. The imports of wheat, flour, peas, barley, and rye decreased, while those of oats, oatmeal, oil-seeds, beans, and maize increased. Wheat imports amounted to 167,451 tons, compared with 190,861 tons in 1910 and 163,785 tons in 1909.

There has been a gradual decline in the imports of flour during the past five years, due to the development of the milling industry in this country. The imports for 1911 amounted to 110,702 tons, compared with 113,020 tons in 1910 and 32,199 tons in 1909. Imports of maize amounted to 97,469 tons, as compared with 81,122 tons in 1910, and oats 46,605 tons, compared with 40,134. The foregoing figures of the maize imports refer to over-sea cargoes, in addition to which a considerable quantity was brought in coastwise from Southampton.

#### **Receipts of Fruit and Minerals.**

A marked feature of the import trade for 1911 was the great increase in the imports of fruit, owing to large consignments of Canadian apples, and a substantial increase in imports from Mediterranean ports.

The imports of minerals showed a slight falling off, with the exception of nickel ore. The more profitable freight rates paid on other cargoes is given as the reason for the decline. The total imports of

minerals of all descriptions, including iron ore, limestone, pig iron, nickel ore, etc., decreased 278,363 tons. Iron-ore imports amounted to 1,213,242 tons, as compared with 1,414,561 tons in 1910; and nickel ore 32,103 tons, compared with 41,383. During the first part of December, however, over 12,000 tons of nickel ore were discharged, so that the year's total will lead by several thousand tons the total for the preceding year.

#### The Coal Situation.

The brisk coal trade anticipated for 1911 did not materialize. The work in arrears at the shipyards owing to the labor disturbances at the close of 1910, the prospects of an exceptionally busy year in the booking of orders for new ships owing to expansion of the over-sea trade, and other signs tended to justify the belief that last year was to prove a prosperous one for the coal industry.

Nevertheless prices dropped during the first months of the year, reaching the lowest point in May and June, after which there was a gradual increase to the end of August, when a sharp advance took place in the prices of all classes of coal. The prices ruling in the Glasgow district after August were 48 to 84 cents per ton higher than in June and 24 to 48 cents higher than at the end of 1910. Splint coal commanded \$2.45 per ton at the beginning of 1911, declining to \$2.15 by June, and reaching \$2.90 per ton in December.

There were 9,736,635 tons of Scotch coal shipped to European countries during 1911, 645,676 tons to countries outside of Europe, and 6,364,500 tons to home ports and for bunkering purposes, making total exports 16,746,811 tons, compared with 16,309,491 tons for 1910. The European shipments were as follows during 1910 and 1911:

Countries.	1910	1911	Countries.	1910	1911
	<i>Tons.</i>	<i>Tons.</i>		<i>Tons.</i>	<i>Tons.</i>
Belgium.....	161,801	194,053	Russia.....	700,307	840,887
Denmark.....	1,301,926	1,287,721	Spain.....	157,328	210,107
France.....	896,503	905,003	Sweden.....	1,179,135	1,182,783
Germany.....	2,900,769	2,820,374	Other countries of Europe.....	371,436	349,261
Italy.....	867,029	943,182	Total.....	9,617,257	9,736,635
Netherlands.....	476,477	460,058			
Norway.....	604,456	573,226			

Exports of coal from Glasgow have been increasing steadily for a number of years, and foreign shipments were expected to reach 2,000,000 tons by the end of 1911, compared with 1,900,599 tons for 1910. Foreign shipments at the end of November amounted to 1,845,098 tons; coastwise shipments, 510,741 tons; and bunker shipments, 1,382,554 tons.

#### Iron and Steel Trades.

The lockout in the shipyards in the early part of last year caused an accumulation of finished material in both the shipyards and steel works, the effects of which were not removed until about the end of April of last year. The steel-making trade on the whole enjoyed a fair year. The plate mills were subjected to considerable competition.

The heavier sections, which are most profitable to roll, have, through this competition, in many instances been lost to home producers. With a view to overcoming this foreign competition, the Scotch and English steel makers jointly devised and put into operation a rebate system. This system met with strong opposition at the hands of the steel merchants, and for a time they refused to buy under the new conditions. A firm demand resulted in the development of a buying

movement about the middle of December, and contracts aggregating over 250,000 tons were placed for delivery in Scotland.

At the beginning of 1911 the price of ship plates was \$33.45; boiler plates, \$37.10; and angles, \$31.63 per ton, all delivered Clyde or equal, less 5 per cent. These rates remained in operation until December 12, when an advance of 5 shillings (\$1.21) per ton was made. The prices at the beginning of April of the present year were: Ship plates, \$34.66; boiler plates, \$38.31; and angles, \$32.84 per ton, all delivered Clyde or equal, less 5 per cent.

#### **Output and Shipments of Pig Iron.**

The year 1911 proved unsatisfactory to makers of Scotch pig iron. Quotations favored buyers almost throughout the year, enabling them to a great extent to purchase at their own terms. The cost of production, labor, and freights, however, steadily increased and only at the close of the year did the manufacturers realize prices equivalent to the value of their commodity.

The output of Scotch pig iron during last year was 1,401,799 tons against 1,414,461 tons for 1910, of which 1,099,956 tons compared with 1,054,886 tons were consumed in the Scotch foundries and the malleable iron and steel works. The imports from England were 614,000 tons, a decrease of 5,500 tons compared with 1910. The exports of pig iron, including foreign, coastwise, and by rail, amounted to 312,141 tons against 303,101 tons for 1910. The principal shipments to foreign countries during 1911 were as follows: Australia, East Indies, China, and Japan, 55,665 tons; British North America, 19,904 tons; Italy, 17,044 tons; Germany, Austria, and the Netherlands, 17,043 tons; Russia and Turkey, 8,021 tons; Belgium, Denmark, Sweden, and Norway, 6,598 tons; Spain and Portugal, 2,883 tons; France, 1,558 tons; and the United States 609 tons. There were 320,987 tons of pig iron on hand at the shops at the end of last year. The number of furnaces in blast at the end of the year was 85, as follows: Ordinary, 40; hematite, 39; and basic, 6.

#### **Hematite and Malleable Iron.**

The heavy accumulation of steel and hematite stocks, owing to the strikes and lockouts in the shipyards in the autumn of 1910, limited the buying of hematite during the first half of 1911. The pressure of steel scrap on the market, and the scarcity of labor prevented the depletion of these stocks as quickly as was generally anticipated. Scotch hematite fell steadily from \$17.52 in January to \$15.20 in September, with the exception of a brief rally in August.

Conditions in the malleable iron trade of Scotland were unsatisfactory during the greater part of last year. In the early part of the year prices were fairly satisfactory, but owing to the scarcity of orders the factories were operated but four and five days a week and close competition among the manufacturers for the export trade resulted in unprofitable transactions.

#### **Locomotive and Sugar Machinery Industries.**

The depression that existed in the locomotive industry during 1910 continued throughout 1911, with the exception of a slight improvement in June and August, which gave hope of a revival in the trade. Orders for future delivery, sufficient to warrant continuous employment for the next few years are being freely booked, and unless some unforeseen obstacles arise a healthy revival of the industry is expected.

On the whole, the sugar-machinery industry had a satisfactory year. Valuable orders were completed for factories in St. Kitts (West Indies), Brazil, Barbados, and Formosa, as well as for additions to factories in Natal, Argentina, Java, Cuba, St. Croix, Dominican Republic, and Portuguese East Africa. A good business was also done with Spain, Portugal, Canary Islands, Philippine Islands, Porto Rico, Mauritius, Fiji Islands, and British West Indies.

**Conditions in the Textile Trade—Cotton Spinning.**

Cotton manufacturers in Glasgow worked under adverse circumstances during most of last year, the principal difficulty being the high price of raw material early in the year, when American cotton stood at 16 cents and Egyptian at 22 cents. Toward the close of 1911 they were 10 and 18 cents, respectively. Buyers of white cottons, lappets, plain, fancy, and madras muslins, and harness brocades and handkerchiefs only purchased sufficient quantities to meet pressing demands. The political disturbances in China and some of the European countries materially reduced shipments to those countries. The high price of yarns early in the year operated against the lace manufacturers, while toward the close of 1911 conditions improved. The Australian and Canadian demand for zephyrs, shirtings, dress pieces, and various other classes of colored cottons was exceptionally good, but the American demand for white and colored goods did not meet expectations. Exports of fancy cloths to India increased over 1910, but shipments to Japan decreased, the demand being irregular. Trade with South America maintained a good average.

Cotton spinning, which was at one time an important industry in Glasgow, is now carried on only to a limited extent. The industry was in a much more flourishing condition at the end than at the beginning of 1911. This was especially true of spinners using American yarns, in which a good business was done in the lower counts. The high price of Egyptian cotton, on account of the short crop, caused weavers to use American yarns where otherwise Egyptian would have been employed. The margin of profit in the spinning industry throughout the year is said to have been small. The thread mills at Paisley report an exceptionally good year, the home and foreign trade being well maintained.

**The Timber Market.**

The timber trade in the west of Scotland during 1911, although an improvement over the two preceding poor years, did not come up to the early expectations of the year. The chief factors contributing to the unsatisfactory consumption of timber were the continued depression in the house-building trade and the scarcity of orders and low prices in the furniture and other wood-consuming industries. There was a steady demand for shipbuilding material and a moderate demand by pattern makers and wagon and carriage builders.

Russia promises to be a serious competitor with Canada in the timber market here. Spruce from Riga now comes direct to Glasgow and the Clyde ports. Formerly this trade was confined to ports on the east coast of Scotland. As Riga has a much lower freight rate to Clyde ports than Quebec, the Canadian timber imports, which have fallen off materially in recent years, will in all probability show a further decline. The high price of Canadian pine makes it almost prohibitive for many purposes for which it was heretofore in great

demand, and rock elm. owing to advanced prices, is only used for purposes for which no satisfactory substitute has been found.

The demand for oak logs was better than in previous years, and pitch pine and teak for shipbuilding purposes were in good demand and firm in price. A firm demand for Canadian birch prevailed, owing to hardwood buyers being attracted by its cheapness and utility. A rise in the price of birch is expected to follow. In furniture woods, mahogany advanced in price under a firm demand and keen competition. Plain oak was in fair demand, but walnut, quartered oak, ash, and canary wood found a weak market. California redwood and greenheart and Oregon and Kauri pine were marketed at prices averaging those of recent years. All stocks are exceptionally low, consequently prices are likely to be well maintained.

A good average year in shipbuilding, coupled with a revival in the building trade, would stimulate the timber industry in this district, and insure a large volume of business at good margins.

#### Shipments from Glasgow to United States and Possessions.

The following table shows the principal items invoiced through the American consulate at Glasgow to the United States, Philippine Islands, Porto Rico, and Hawaii for 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
<b>TO UNITED STATES.</b>			<b>TO UNITED STATES—CON.</b>		
Aluminum.....	\$250,751	\$129,896	Silk goods.....	\$19,483	\$4,126
Automobiles and parts.....	2,053	565	Steel and steel ware.....	40,586	27,997

Sheep casings.....	55,713	84,830			

Owing to the uncertain state of trade, the exports from Glasgow to the United States fell \$822,693 in value as compared with 1910, but they were \$1,570,781 in advance of 1909. The items showing the greatest decline were chemicals, machinery, cotton piece goods, gutta-percha, aluminum, pig iron, wool, and muslins. There was a large increase in the shipments of boiler material, creosote oil, provisions, union goods, and thread.

The exports to the Philippine Islands continue to decline, the figures for 1911 showing a decrease of \$73,004 compared with 1910 and \$218,685 compared with 1909. The principal decreases were in cottons, thread, and iron and steel. There was a large increase in the shipments of machinery to the Philippines. There were articles valued at \$10,164 and \$7,477 invoiced to Porto Rico and Hawaii, respectively, last year, while none were declared to these islands for 1910.

#### The Sugar Industry at Greenock.

The six sugar refineries in Greenock were in operation throughout the year, the output for 1911 surpassing the large production of 1910. The year opened with heavy supplies of raw material available from the large beet crop of the previous season and bright prospects of a material increase in cane supplies. There was a steady demand for Greenock refined sugar in spite of sharp foreign competition. The output for last year was 221,150 tons, notwithstanding an increase of nearly 100,000 tons in the imports over 1910.

When the Brussels convention came into operation, the output dropped to 120,570 tons, but since then it has steadily increased each year until it reached the record figures of last year. Under the convention Great Britain places no restriction on imports from any part of the world, the limitation of 200,000 tons from Russia having been imposed by other Continental signatories.

An important fact which Greenock refiners have to contend with is that refined sugar from German and Dutch ports enters Britain at lower rates than Greenock refiners can obtain for their product throughout the United Kingdom. Aside from the home trade, a good export trade is carried on with Canada and the north of Europe ports, and to some extent with South Africa, Portugal, and Italy. Exports to Canada in 1911 totaled 6,500 tons and to north of Europe ports 4,794 tons.

The prices of sugar, which were steady and moderate during the first half of last year, rapidly advanced, owing to the drought in the principal beet-growing districts of the Continent, and by the end of August they were \$4.50 per hundredweight of 112 pounds f. o. b., the highest point reached since 1893.

#### Exports from Greenock to United States.

There was no sugar invoiced through the Greenock agency for shipment to the United States last year, hence the large decrease in the value of the declared exports compared with 1910. The principal items for 1910 and 1911 were as follows:

Articles.	1910	1911	Articles.	1911	1911
Furniture:			Pigskins.....		\$1,201
Antique.....		\$146	Sugar.....	\$2,187	
Household.....		1,436	Whisky.....	377,701	
Hogskins (tanned, dressed)....	\$10,383	4,578	All other articles.....	490	3,778
Leather.....	6,203	10,856		1,779	937
Magnesia, calcined.....			Total.....	398,733	23,215

**Conditions in the Troon District.**

The chief feature of the commerce and industries in the district comprising the Troon agency during last year was the exceptional prosperity in the shipbuilding trade. There was also a large increase in coal shipments, which is accounted for by several new collieries having been opened up.

The textile industries did not participate in the general prosperity, owing to scarcity of raw material and its high prices. During the latter part of the year the market was supplied with a large quantity of cotton from the United States, and all the works were fully employed during the last two or three months of the year. There has been a noticeable falling off in the American market for muslins and other textile fabrics, and increasing demand from the British colonies, especially Canada. The following is a list of the articles invoiced at the Troon agency for the United States during 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Books and tracts.....	8210	\$585	Linings.....		\$331
Canvas, hemp.....	1,562	2,298	Plants.....	\$3,422	3,143
Carpeting and rugs.....	52,131	38,255	Seeds, grass.....	2,105	1,450
Cloth, cotton.....	69,157	80,209	Shawls, fringed.....	3,552	
Costume cloth.....	1,551		Tapestry.....	2,894	
Cotton lining.....	1,132	1,095	Thread, linen and twine.....	119,233	109,286
Curling stones and handles.....	798	765	Whisky.....	59,745	42,743
Curtains, crepe, madras, and muslins.....	165,878	169,928	Woolen caps and scarfs.....	1,023	2,248
Flax, dressed.....	4,365	31,080	Worsted and woollens.....	8,811	22,472
Grindstones.....	112	481	Yarn, linen.....	2,987	4,539
Hogskins, dressed.....	952	1,090	All other articles.....	5,278	240
Horn and gritstones.....	5,638	6,164			
Household goods.....	402	457	Total.....	463,943	519,959

**American Implements on the Market—Iron-Ore Imports.**

American machinery for agricultural purposes continues to be in general use and farmers are largely taking advantage of the frame drills of the forced feed type. Parts of the various agricultural implements of American manufacture are now kept in stock by certain wholesale houses, and farmers and others have no difficulty in getting repairs executed. Joiners and other artisans' tools of American production are largely used and are stocked in all the principal ironmongers in the chief centers. These articles and other American produce are in general demand, but as they are distributed throughout the district from Glasgow and Liverpool, reliable statistics as to quantities are not available.

During the past year no American-owned vessel arrived at any of the ports in Troon district. Norwegian vessels entered largely into the carrying of timber and pitwood, and a few Spanish steamers were engaged in the iron-ore trade. The iron-ore supply from Spain has been diminishing during the last few years, and new supplies are coming from Norway, Greece, France, and Newfoundland.

**Industries of the District—Wages.**

The principal industries in the district on the seaboard are shipbuilding, marine engineering, sawmilling, and coal exporting, the latter commodity going principally to Ireland and the Continent. There are factories for the manufacture of explosives and chemical and iron works.

The principal industries inland are coal mining and iron production, the works of the latter being adjacent to the collieries and also con-

venient to the seaports. The other inland industries are mainly textile, comprising the manufacture of curtains, muslins, carpets, rugs, and thread. Agriculture is carried on successfully on the small holdings system under tenancy. The soil is rich throughout, and potatoes, hay, and corn are cultivated with continued success. The products are principally consumed in the home markets. Cattle raising and horse breeding are also carried on.

The following are the current rates of wages in the district per 5½ days as ascertained from reliable sources: Bakers, \$7.50; blacksmiths and masons, \$10; engineers, iron founders, ship carpenters, joiners, miners, plasterers, plumbers, and painters, \$9; slaters, \$8.50; and lace weavers, \$7. Ship platers and riveters, on piece work, can earn \$10 per week of 5½ days.

### DUNDEE.

[By Consul E. Haldeman Dennison.]

Dundee is the third largest city in Scotland in point of population but second in commercial influence. It is served by two railroads, by which communication is maintained with England and all parts of Scotland. There is also regular communication by sea with London, Liverpool, Manchester, Newcastle, Hull, Southampton, Cardiff, and Belfast, as well as with Hamburg and Rotterdam.

The corporation owns the water supply, gas and electricity works, tramways, markets, public baths, cemeteries, and slaughterhouses. It is a city dominated by one industry.

#### Industrial Conditions.

The character of the city, its industrial conditions, and its place in the commercial world are all determined by the fact that it is the seat of the jute trade. It is also the center of the seal and whale fisheries, but much of the traffic of the port consists of the import of the raw material necessary to the predominating industry and of the export of the finished article. Dundee is also an important center of the linen trade, but compared with jute, linen plays only a small part in the trade of the city.

Notwithstanding substantial business connections, skill in productive methods, and expert knowledge of requirements, unfortunately the Dundee jute trade has occupied an unenviable position between the rivalry of the Calcutta industry and competition at home and on the Continent. Industrially, the city did not make an advance of consequence last year. The shipbuilding and building trades have been declining for several years, although the former industry improved somewhat last year. Work in the foundries, upon which so many depend, was unsatisfactory.

According to data recently issued by the board of trade showing the cost of living in the principal cities, it was shown that, excepting London, the cost of living was greater in Dundee than in any other city of the United Kingdom. This was due, however, to the unduly high prices for coal and bread.

#### Imports and Prices of Jute.

The imports of jute into Dundee from Calcutta and Chitagong, British India, last year were 1,085,281 bales of 400 pounds each against 1,125,891 bales for 1910. Of the total imports last year 42,027

bales, compared with 19,612, bales, were reexported. There was a wide range in the prices of jute last year, varying from \$87.60 to \$133.83 per ton for native first marks. For the past two seasons there has been a scarcity of fine jute, and several of the cargoes discharged were badly damaged.

Spinners and weavers of jute yarn and cloth experienced in 1911 one of the worst years in the history of the trade. It was not until the last three months of the year that any improvement was perceived. The output for the year was curtailed beyond all previous records, and two mills went into liquidation. This condition was largely attributed to the excessive output in Calcutta, the difficulty being intensified by a short crop of jute, with a consequent rise in prices for the raw material.

Prices of jute, which had advanced considerably when the year opened, were expected to remain firm, and the local spinners were not prepared for the subsequent rise. From January to May prices continued to advance, throwing the jute trade into a state of chaos and compelling the closing down of looms and spindles. New crop prospects exerted their influence, and raw jute prices of the 1910-11 crop fell steadily during June and July. Prices of yarns and cloths, which had never been able to approach the equivalent of jute, receded in sympathy. It was not until September that any signs of improvement were observed. A further reduction in the Calcutta mill output brought supply and consumption more on a parity.

#### **Jute Yarn Trade.**

During the last three months of the year there was an improvement in both the yarn and cloth trades. Most establishments had begun to run full time and some works which had been closed restarted. The new crop provided a good supply of medium and low qualities, but fine jute was scarce. Prices of all grades, and particularly of fine jute, remained high, however. There was a fair demand for jute yarns in the lower qualities and the prices obtained were not so unremunerative as in the beginning of the year. Prices obtainable for the finer yarns, however, were insufficient to cover cost of production.

There were exported last year 49,333,700 pounds of jute yarns, valued at \$3,426,449, compared with 58,852,700 pounds, valued at \$3,393,128, for the previous year. Germany was the only country showing increased purchases. The principal shipments for 1910 and 1911, respectively, were as follows: To United States, 5,399,200 and 1,126,000 pounds; Brazil, 25,614,100 and 22,024,000 pounds; Germany, 1,296,100 and 1,683,800 pounds; Spain and Canaries, 1,867,200 and 1,117,100 pounds; and other countries, 24,676,100 and 23,382,800 pounds.

There was a wide fluctuation in the prices of jute yarns during last year. The quotations, December 31, were as follows: Common cops, 46.13 cents; spools, 47.65 cents; 24-pound weft, 4.81 cents; and 8-pound Rio weft, 54.74 cents.

#### **Shipments of Jute Cloth.**

In jute cloth the feature of the last quarter of the year was an unexpected demand from River Plate ports for bags. As a rule, these bags are sewn in Argentina from Calcutta cloth, but the South American buyers had deferred making their purchases. Owing to an unexpectedly large wheat crop, an unusually large supply of bags

was required, and the Argentine factories were unable to cope with the demand, therefore all available hessian bags on the Dundee market were purchased. This revived the narrow-cloth section of the trade considerably. All stocks were cleared out, full time resumed, and standing looms restarted. There was also a demand for sackings, baggings, and tarpaulins in the closing months of the year. The price of 10½-ounce 40-inch cloths at the end of last year was 4.73 cents; 8-ounce 40-inch cloth, 4.22 cents; and 16-ounce sack, 6.2 cents.

The shipments of jute piece goods last year amounted to 149,450,300 yards, valued at \$9,951,992, compared with 176,401,100 yards, valued at \$10,034,887, for 1910. In this item, as with jute yarn, Germany was the only country showing an increase in purchases for last year. The following table shows the exports to the principal markets for 1910 and 1911:

Destination.	1910	1911	Destination.	1910	1911
	<i>Yards.</i>	<i>Yards.</i>		<i>Yards.</i>	<i>Yards.</i>
United States.....	83,834,000	66,883,900	Germany.....	1,308,900	2,935,100
Argentina.....	11,413,400	8,384,300	New Zealand.....	2,395,500	2,076,600
Australia.....	5,495,800	3,020,000	All other countries....	46,610,700	43,718,100
Brazil.....	797,800	246,300			
Canada.....	23,406,600	21,286,800	Total.....	176,401,100	149,450,300
France.....	1,137,700	889,200			

#### The Linen Trade.

The great rise in the price of flax consequent to the poor crop of 1910 made business unprofitable in the spinning of yarn and manufacturing of linen. Prices of the raw material reached a higher level than at any time during the past decade, while yarns and cloth were difficult to dispose of at prices corresponding with the cost of production. The feature of the manufacturing branch was the steady demand for canvas and other heavy fabrics, Government contracts predominating. The demand for fine fabrics was impeded by the excessive rise in values. In the closing months of the year, however, prices of raw material fell to a comparatively reasonable level.

During the year there were imported 17,588 tons of flax, tow, and codilla, as compared with 18,189 tons in 1910 and 16,439 tons in 1909. The flax and tow that had to be utilized in the first half of the year were of inferior quality, which, nevertheless, commanded high prices. The new crop prospects somewhat relieved the market, and there was a gradual decline in prices until November, when the market utterly collapsed, continuing throughout December.

Government orders created a good demand for duck yarn, the price of which rose to 22 cents per pound. With a larger and cheaper supply of raw material, there is every reason to believe that the trade in 1912 will show great improvement. The value of the exports of flax and linen yarn to the United States showed large increases, while those of household linens and linen piece goods decreased by \$91,344.

#### Increased Output of the Shipbuilding Yards—Marine Engineering.

The Dundee shipbuilding firms shared in the general prosperity which the industry enjoyed throughout the British Isles during 1911. From the yards of the Caledon Co. and the Dundee Shipbuilding Co. 16 vessels were launched, with a total tonnage of 16,227, and 14 barges, as compared with 5 vessels, of an aggregate tonnage of 5,922, and 6 barges in 1910, when the industry was greatly disturbed by labor

troubles. The outlook for 1912 is also most promising. The Caledon Co. had orders for 7 vessels at the end of March of this year, of an aggregate tonnage of 10,385, including a large oil-carrying steamer for trade on the American Great Lakes. The Dundee Shipbuilding Co. has much work on hand, including an ice breaker and mail carrying steamer for Newfoundland, a passenger and cargo steamer for the colonies, and two schooners for a South American firm.

Marine engineering, in consequence of the great improvement in shipbuilding, showed considerable advance. Ten sets of engines were completed, with an aggregate indicated horsepower of 14,770, as compared with 7,800 for the previous year. The prospects for 1912 are considered good.

#### **Shipping of the Port—The Whaling Industry.**

Since 1907 there has been a steady decrease in the tonnage on the register of the port of Dundee. In that year there were 119 vessels, with an aggregate tonnage of 99,338. At the close of 1911 the number of vessels on the register was 95, of 71,673 tons. For the greater part of this period shipping, owing to various causes, was unprofitable, and the tendency was to sell rather than to buy ships. For some time past, however, there has been a great improvement in freights, and local shipowners will probably be tempted to add to their fleets during the next 12 months.

The year 1911 was one of the most unprofitable on record for whale fishing. The total produce of the Dundee whaling fleet was only 69 hundredweight of whalebone and about 139 tons of oil, compared with 237 hundredweight of whalebone and 287 tons of oil in 1910. The fleet consists of 8 vessels. During recent years the product of the Arctic brought home by the local vessels has greatly decreased, and last year the visit of the whalers to the northern fishing grounds was practically a failure, and therefore it is probable that none of the vessels will depart for the Arctic this year. About 30 years ago one ship would bring home as much bone and oil as the whole fleet does now.

#### **The Machinery Trade—Fruit Preserving.**

Machinery manufacturers had a quiet year owing to the depression which existed in the various textile trades. Orders were largely limited to the replacing of machines which had become worn out, the exception being orders for machinery for extensions of jute mills on the Continent, and these latter orders were just sufficient to keep the machine works moderately employed. There were practically no new factories erected in Calcutta, which has been for years the only large market for jute textile machinery, and consequently there was no immediate demand for machinery. A new factory for the manufacture of canvas is being erected in Dundee, and the preparing and weaving machinery is being made in this city.

The fruit preservers report that owing to the drought last summer the fruit ripened early and the market was glutted, and consequently prices of preserves were not up to the average. Gooseberries, which come in at the first of the season, were a short crop and prices were \$3.40 to \$3.65 per hundredweight. Strawberries the first of the season were \$6.07 per hundredweight, but owing to the dry weather they increased to \$8.51, but there were large supplies the latter part of the season, and prices declined considerably. Raspberries were \$9.72 per hundredweight when first entered on the market, but owing to the rapidity of growth in fine weather, they dropped to \$7.29.

Black currants were a fair crop, but they are always more or less scarce in this district and considerable quantities were imported from France. They ranged in price from \$8.51 to \$9.72 per hundredweight and even higher in some instances. Red currants were a good crop, and prices were \$3.89 to \$4.38. Plums would have been a good crop but for the dry weather, which caused a great many of them to fall to the ground before maturing. About \$3.40 per hundredweight was paid for the best plums.

#### Effect of Drought on Crops.

Owing to the light hay crop and poor grazing due to the drought, dairymen suffered heavy losses, and graziers and feeders were put to considerable expense for feedstuffs. The root crops, which showed great promise at the beginning of the year, suffered from lack of moisture as the season advanced, and turnips in some districts were almost a complete failure. The grain crops were naturally affected by the unusual dryness and the yields were correspondingly light. In most districts wheat was the principal crop of the season, both as regards yield and quality. Barley and oats were far short of the average yield, and there was a shortage of straw. The potato being a sun plant, withstood the drought better than any other plant, and the crops in Scotland were generally satisfactory, there being little disease among the tubers.

Owing to the short American crop, large quantities of potatoes were shipped from this district during the latter part of the year. One ship, with a cargo of potatoes only, went direct from Dundee to New York. This outlet was opportune, as with the increased acreage under potatoes and the larger average crop it would have been impossible for all the potatoes to be consumed in the home markets.

#### Exports to United States and Possessions.

The total value of exports from the Dundee district to the United States as invoiced at this consulate for 1911 was \$7,554,458, as compared with \$7,587,785 in 1910. Jute yarn, bagging, and burlap exports showed considerable declines, while those of raw jute rose from \$60,197 to \$208,402. In the linen trade flax and tow exports reached record figures, but as in the case of jute manufactured goods showed considerable decreases, except in yarn, which increased in value from \$242,320 to \$337,539. The following table shows the exports to the United States in 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Cotton, manufacturers of:			Jute, and manufactures		
Cloths.....	\$10,346	\$3,147	of—Continued.		
Yarn.....	561	12,112	Yarn.....	\$232,738	\$70,305
Duck, sail.....	18,603	50,104	Other.....	1,311	
Flax, and manufactures			Machinery.....	31,865	37,952
of:			Paddings.....	634,722	639,048
Flax and tow.....	434,727	582,358	Paper.....	5,169	1,594
Linen goods.....	1,210,570	1,119,226	Paper stock.....	48,861	31,814
Yarn and twine.....	242,434	337,539	Preserves.....	50,879	63,495
Gauge glasses.....	39,115	34,098	Printing material.....	35,674	876
Golf goods.....	9,468	4,793	School bags.....	3,638	3,681
Hemp, and manufactures			Spirits, whisky.....	203,701	217,382
of.....	1,747	5,262	Vegetables, potatoes.....		140,021
Hides and skins.....	10,027	21,864	Whalebone.....		10,103
Jute, and manufactures of:			Wool and hair.....	90,555	66,143
Raw.....	60,197	208,402	All other articles.....	22,914	12,117
Bagging.....	300,141	270,479			
Burlaps.....	3,834,841	3,545,897	Total.....	7,587,785	7,554,458
Carpeting.....	46,981	53,146			

The exports to Porto Rico were valued at \$55,669 compared with \$41,239 for 1910. Jute bags represented \$48,149 last year and linen piece goods \$6,449. The shipments to the Philippines amounted to \$11,483, a small gain compared with 1910, and were made up of duck sail valued at \$6,609, whisky \$4,084, and other articles \$790. Whisky was the only item invoiced to Hawaii, which amounted to \$5,064.

#### ABERDEEN AGENCY.

[By Consul E. Haldeman Dennison, Dundee.]

Aberdeen is connected with other parts of Scotland and England by three railroads. By means of steam packets it has communication with the leading English ports and with the north of Scotland, as well as with the Orkneys and Shetlands. Like Dundee, the city owns the water, gas, electric works and tramways.

The port has considerable and increasing trade and it is the center of the Scottish fishing industry. Shipbuilding is one of the important industries, and considerable business is done in the textile trade. Other industries include the manufacture of combs, paper, preserved provisions, boots and shoes, motor body and coach building.

#### The Quarrying Industry.

The deposits of granite which are stored in this region have become a source of great profit to the city. This material enters largely into the construction of its buildings, docks, and bridges, and a large export trade has been developed; also an auxiliary trade, that of granite polishing. Aberdeen not only polishes its own granite, but large quantities of foreign granite are imported for polishing.

The quarrying industry, however, was depressed last year. Building material, on account of the stagnant state of the building industry, was in poor demand, and there was a large market for other classes of stones. The quantity of granite sets exported during the year amounted to 19,067 tons, compared with 19,073 tons in 1910. The decrease is small, but the 1910 exports were a decrease of 12,708 tons compared with those for 1909. The United States, United Kingdom, and Canada are the principal markets in the monumental trade. The decrease in the American shipments last year was due to the increased prices demanded. The trade with the Continent in polished fronts continues to hold its own in competition with France, Belgium, and the Netherlands. The imports of foreign granite increased from 25,467 tons in 1910 to 30,386 tons last year.

#### Shipbuilding—Horn Comb Industry.

During last year 48 vessels were launched at Aberdeen, against 34 in 1910 and 26 in 1909, and the total tonnage was 9,607, 10,488, and 6,237, respectively. The decrease in the tonnage for last year, although an increase in the number of vessels built, was accounted for by the fact that in 1910 one steamer was launched representing a tonnage of 4,823, while in 1911 the largest steamer launched was of 1,005 tons. The prospects for the current year are reported bright, and with the advent of a large floating dock at Poca Quay, it is expected that larger vessels will come to Aberdeen to be repaired, which will prove an impetus to the shipbuilding industry.

Aberdeen still continues to be the largest center for the manufacture of horn combs, but the manufacturers report that although the

overturn was slightly better last year than for 1910, high tariffs have had the effect of reducing profits.

#### Trade in Paper and Timber.

The paper industry experienced a good year. Competition was keen, with the result that prices were cut to the lowest figure and profits were not as might have been desired. Raw materials, including coal, advanced in price, but increased competition prevented the sale of the manufactured articles at corresponding advances.

The demand for the usual classes of foreign wood remained fairly steady. There was a large demand for pulp wood, and the imports from Archangel were the heaviest on record. A gratifying feature in the trade was the distinct revival in the shipbuilding industry, which caused an increased demand for timber. The home timber trade remained firm. Large areas of woodland were depleted, and, owing to the high prices ruling for home-grown timber, this tendency is likely to continue.

#### Boot and Shoe and Motor-Body Industries.

The boot and shoe industry at the beginning of 1911 was depressed, but later on a revival took place. In common with other industries boot and shoe manufacturers had to pay considerably higher prices for raw materials. A noticeable feature of the year was the exceptional demand for patent-leather goods and the continued decline in the wear of tan leather.

Coach building has given place to motor-body building. A large number of motor-car bodies are now manufactured in the city for motor-car manufacturers in other towns, and this trade shows signs of expansion. There was a strong upward tendency in the motor-car trade in 1911, and the motor-body builders were kept busy.

#### Building Operations—Exports to United States.

There was little improvement in the building trade during last year. The total value of the building permits during 1911 was \$728,908, compared with \$487,793 in 1910, the increase being due to the erection of a new freight station by the Caledonian Railway. The tendency recently has been to erect dwelling houses of the cottage type, costing about \$2,500.

The following table shows the items and their values invoiced at the Aberdeen agency for the United States during 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Combs, horn.....	\$16,077	\$21,290	Linens.....	\$27,390	\$22,631
Enamel.....	3,985	3,278	Paper.....	6,199	6,243
Fertilizer.....	7,064	8,256	Whisky.....	22,005	21,614
Fish.....	591,259	596,023	Woolen goods.....	47,425	57,791
Fishing flies.....	2,689	3,733	All other articles.....	14,754	11,400
Granite.....	165,112	133,305			
Horn meal.....	5,943	25,893			
Iron sand.....	13,549	12,525	Total.....	934,150	924,111

The value of the shipments to the American insular possessions during last year was as follows: To the Philippine Islands, \$415, comprising whisky and horn combs, and to Porto Rico, \$164, made up of dried fish.

**DUNFERMLINE.**

[By Consul H. D. Van Sant.]

The imports into the consular district of Dunfermline from the United States during 1911 increased in value compared with the previous year. Some of the old line of imports have been supplanted by improved mining tools, concrete machines, hardware, etc.

There are no customhouses in Dunfermline; therefore the only way of ascertaining the value of American goods entering this market is through local shopkeepers, and the total imports of American goods are estimated at \$25,000 to \$50,000 annually. The building of the Rosyth naval base was responsible for the increase in the imports during 1911.

Dunfermline's and, in fact, nearly all of Scotland's American purchases are directed from London, Glasgow, and Edinburgh. The territory covered is relatively small in area and easily reached from Glasgow or Edinburgh, while the cost of direct or separate imports into each inland town or village would be more costly; therefore shipments are made in bulk usually through the leading seaports.

**Displaying of American Goods.**

During last year several new shops were opened in Dunfermline, displaying an increasing proportion of American products. In a well-arranged window a full-sized "silver steel" saw made in Indianapolis was displayed, marked 15 shillings (\$3.65). Side by side with this American saw were English makes selling for 6 to 8 shillings (\$1.46 to \$1.95) each. Because of superior finish, quality, and workmanship, as stated by the shopkeeper, the American saw, at a higher price, is selling well and is establishing a reputation never before attained in this district.

An American line of gas stoves was introduced, selling at 15 shillings (\$3.65). One of the dealers stated that a considerable number of these portable stoves were sold during last year and that the American gas stove is preferred over other competitive makes, because of cost, utility, and novelty.

In a boot shop investigated, colonial rubbers from Boston were meeting with a surprisingly large sale, considering that the rubber-shoe market had been heretofore controlled largely by other than American makes.

There is oftentimes a better opening for the sale of American goods to new firms than to the old establishments which are generally well stocked in old lines, because success, custom, and natural preference to home manufacturing interests do not readily change. Yet after they recognize the superiority of an article, as evinced by the sales of the new competitor, they are not slow to introduce the same goods themselves. New shop openings should be reported to the American trade when practicable.

**Coal Industry—Rosyth Naval Base.**

Up to July the prospects in the coal trade of Fife in this district were gloomy, but since then there has been a steady advance, and during the fall it was difficult to fill orders. The price of first-quality coal was advanced 1 shilling (24 cents) per ton toward the end of 1911, and 6 pence (12 cents) per ton for second-quality coal at wholesale. Retail coal was sold to the house trade in Dunfermline at 14s. to £1 (\$3.40

to \$4.86) per ton. The total shipments of coal from Burnt Island amounted to 2,430,708 gross tons, an increase of 302,490 tons over 1910 and 236,000 tons over any previous year. The coal trade of this district has increased in export nearly 1,500,000 tons during the last 10 years. Most of the shipments are made to European countries. The latest statistics show that 28,344 persons are employed in and about the Fife coal mines.

The act to extend the city's boundaries so as to include the vacant land between the present limits to the Rosyth naval base and the Firth of Forth went into effect May 15, 1911. The new area will likely be taken up with the homes of the families of the officers and men of the British fleet to be stationed at Rosyth as well as the large number of men to be employed at the works.

The Rosyth naval base construction is the most important work progressing in this district or in this part of Scotland. It is situated about 5 miles south of Dunfermline. Much progress has been made on this work during the past year. The contractors say they are ahead of the contract time for completion in September, 1916, and unless unforeseen obstacles are met with they will earn a considerable bonus, amounting to about \$35,000 per week. The number of men employed at the works is about 2,500. There is to be an expensive electric power station installed in the building just begun, and a \$500,000 sewage plant is to be built on the vacant space between Dunfermline and the works. American concrete mixers and drilling and other machinery and supplies have been used in this work.

#### Exports to United States.

Linen forms the chief article of export through the American consulate at Dunfermline to the United States. During the past two years there has been a decrease in the American purchases, due perhaps to the increased production in the United States and the keener German competition. German linens are now being offered in the Dunfermline market in direct competition with the local output. The looms were mostly employed during the year, and it is estimated that the general volume of business was about 7 per cent short of the preceding year.

The total value of the exports to the United States was \$2,292,896, against \$2,504,836 in 1910. The articles for the two years were as follows:

Articles.	1910	1911	Articles.	1910	1911
Cottons.....	\$75,804	\$82,759	Linoleum, floorcloth, etc..	\$477,315	\$425,898
Furniture.....	19,640	7,957	Scotch tweeds.....	6,041	5,912
Golf-iron heads.....	1,553	4,684	Unions.....	8,614	8,305
Jute:			Yarns.....	37,460	12,346
Paddings (burlaps)....	8,829	6,006	All other articles.....	4,773	3,351
Raw.....	150	2,230			
Linens.....	1,863,991	1,732,449	Total.....	2,504,836	2,292,896

#### EDINBURGH.

[By Consul Rufus Fleming.]

General business conditions in this Scotch district for any period are fairly well indicated by the experience of the banks. The average bank rate in 1911 was approximately  $3\frac{1}{2}$  per cent, as compared with  $3\frac{3}{4}$  per cent in 1910, the average charge on bills up to two months

date being 4 per cent, as against  $4\frac{1}{2}$  per cent, and the average rate of interest allowed on deposits was slightly less than 2 per cent, compared with  $2\frac{1}{2}$  per cent.

While the banks were not able to loan funds quite as profitably as in 1910, their earnings were on a somewhat higher scale, on account of the increased activity in the demand for accommodation on the part of industrial and commercial enterprises, especially the ship-building, iron and steel, and woolen industries, and the shipping trade. The expansion in the net profits of the leading Scotch banks amounted to about  $2\frac{1}{2}$  per cent. Depression in several classes of securities, however, proved a considerable drain on profits, as in 1910.

#### **Number and Capital of Joint-Stock Companies.**

The prosperity of some branches of industry and of commerce did not have any appreciable effect on the stock exchange markets. The year was a normal one in respect to the flotation of joint-stock companies in Scotland. The number of such companies registered—shipping, fishing, mining, manufacturing, financial, etc.—was 359, with an aggregate capital of \$30,423,840, as compared with 367, having an aggregate capital of \$33,011,660, in the preceding year. Of the companies registered last year, 283 with a total capital of \$19,606,350 were private companies, i. e., each having a membership of 50 persons, exclusive of employees, and the shares of which are not offered to the public. The conversion of firms into private joint stock companies has little significance, favorable or unfavorable, as to the state of trade or industry. In many cases it is merely a convenient arrangement whereby the heads of concerns transfer to others the whole or a share of responsibility of management.

#### **Prosperity in the Woolen Industry.**

Exceptional prosperity was experienced during last year, by the woolen manufacturers in this district where for some years the woolen industry has been active. All the spinning mills worked day and night, and the weaving mills found much difficulty in fulfilling contracts on time. The fashion at home and abroad ran distinctly in favor of cheviot cloths. Several south Scotland firms confined their attention solely to cheviots. The phenomenal demand for this make of goods was aided by the high prices of saxony woolens and worsteds. Weave played little part in the creations of the designers; in coloring, however, many varieties were displayed, mixtures of every hue being conspicuous. Solid colors were not quite so abundant. This condition handicapped the scanty equipment of Scotch spinners, because mixtures can not be rushed through at the same speed that solid colors can.

It is thought that if these prosperous conditions in the Scotch woolen industry continue manufacturers must increase their spinning plants, the present 300 sets of machines being insufficient to supply over 3,000 looms. While the yarn-making plants are for the most part old, the weaving plants are up to date.

As an indication of the pressure of orders upon the cloth mills, some manufacturers raised their prices, in a few instances as much as 4 cents per yard, to keep down the demand and so far as possible to avoid the necessity for increasing their plants. The motor-car trade was last year more than ever a factor favorable to Scotch tweeds. Several firms made overcoat cloths weighing 3 pounds to the yard.

**Markets for Scotch Woolens—Hosiery Trade.**

The principal market for Scotch woolens is the United Kingdom. Of foreign markets, Germany is the best, while Canada, Australia, and South Africa are important markets. Buenos Aires has become the center of a considerable trade with South America.

Hosiery manufacture, which includes vests, ladies' caps, scarfs, long coats, men's jackets, underwear, etc., was another successful department of the woolen business last year. In Hawick, the largest hosiery town in the district, with 17 mills, the trade was steady and profitable throughout the year, some of the leading firms working overtime to cope with orders. The foreign demand, especially from France, Canada, and South America, was notably strong.

It is estimated that the aggregate value (at manufacturers' selling prices) of woolen goods produced in the district in 1911—cloths, hosiery, yarns, and blankets—was about \$21,000,000, an increase of 15 per cent over 1910, which was a record year in the Scotch woolen trade.

**Mineral Oils and Their Products—Output of Distilleries.**

The shale-oil industry, carried on by five companies, was again affected by the competition of foreign petroleum, which forced a reduction in the prices of burning oil and paraffin wax. The market for lubricating and gas oils and shale spirit was fairly steady through the year. Sulphate of ammonia, a valuable product of the Scotch oil companies, advanced in price about \$5 per ton; but much of the additional revenue from this source was absorbed by the increased costs of oils to be sold on a falling market. A large proportion of the 55,000 tons of sulphate of ammonia produced annually in Scotland goes to the United States and Hawaii to fertilize sugar plantations. Japan also is an important buyer. At the close of the year the market was firm at \$69 per ton.

The few distilleries in the district make grain whisky, principally by the patent-still process, the materials used being maize with 15 to 20 per cent of barley malt added. The production in 1911 was about normal—5,500,000 proof gallons—which is a small proportion of the total production of whisky in Scotland. Toward the end of the year the price of grain whisky advanced 2 cents per gallon, owing chiefly to a deficiency of maize. At the same time there was an enhanced demand from the blenders to supply an increasing consumption, and the entire trade was more active than it had been at any period in the preceding 10 years.

Although the home and foreign trade in ale and beer was above that of 1910, the domestic consumption was far below that of six years ago and the output unsatisfactory, being estimated at 1,100,000 barrels of 36 gallons each of beer and ale.

**Paper and India-Rubber Industries—Coal Mining.**

The 23 local paper mills, all of which make high qualities of writing and printing paper, had a fairly profitable trade, prices being well maintained throughout the year and the prices of materials—esparto, rags, and wood pulp—ruling lower than in 1910. The value of the output is given by experts in the trade as approximately \$11,500,000.

The india-rubber industry, which for a long period produced an annual average of \$5,000,000 worth of waterproofed clothing, boots

and shoes, tires, etc., was greatly depressed last year, especially in the footwear department.

With an increased productive capacity, the collieries of the district had a diminished output, as compared with 1910, due apparently to inadequate railway facilities, making delivery slow and expensive. The leading coal-mining companies propose to build and operate two lines of railroad between the coal fields and the port of Leith.

**Shipbuilding and Structural Steel Works—Crops.**

The shipyards on the Firth of Forth increased their output by 2,000 tons over 1910. These yards turn out yachts and other small vessels. The structural-steel firms had a busy and profitable year, in consequence of an increased demand for steelwork in nearly all parts of the country.

Farmers were generally prosperous. Wheat was above the average for the previous 10 years in both quantity and quality. Oats and hay were of exceptionally fine quality, but the yield was somewhat short; prices were satisfactory. There was a large yield of potatoes, and the growers were greatly benefited by the American demand.

**Increased Trade with the United States—Motor Cars.**

The east Scotland shipowners report better conditions in the shipping trade during 1911 than for some years past, especially during the last three months of the year. In the trade with the United States the earnings of vessels increased markedly, the principal outgoing cargo being sulphate of ammonia and potatoes, and the incoming cargo consisting mainly of grain, timber, provisions, feed stuffs, and general merchandise. In most lines of American manufactures and products there was a gain in the imports compared with 1910, a notable exception being in footwear, both leather and rubber.

In motor cars, two dealers stated that they had trebled their sales of American cars. One special recommendation of American cars, stated one dealer, was that even the cheapest of them have silent running gears—usually quieter on the lower speeds than a high grade British car—due probably to better material and construction. There was an extraordinary demand for durable cars selling at low prices—\$800 to \$1,200—and also for several types of American motor cycles. The American invasion in motor vehicles is not regarded as a temporary but as a permanent factor in the trade, which will probably develop rapidly and force a reduction of the entire market to a new basis of values, and the Scotch makers and dealers see the near approach of the end of the period of high prices and great manufacturing profits. As a result of the increased popularity of American cars in this country, sales of all kinds of motor accessories were far in excess of those for 1910, except in speedometers and lamps, which have been in strong demand for several years.

**Men's Furnishings and Branded Goods.**

A general improvement is reported by prominent houses in the sales of American men's furnishings, including scarfs, shirts, collars, suspenders, garters, and ready-made clothing. The business of one Edinburgh retail firm in these lines increased \$4,000, as compared with 1910. Some smaller houses find fault with branded goods. One dealer stated that "a business that sells branded goods lacks indi-

viduality, and it is only the possession of this quality that will save the smaller merchant from extinction. A customer for branded goods knows he can get exactly the same articles at the same prices at any other place. As to cheap goods, this objection may not apply, but to a 'connection' business, serving the better class of customers, it is fatal." The average retailer's objection to goods bearing trade names or the makers' names is much stronger in this country than in the United States, because even the small firms here in some lines advertise themselves as "makers" as well as merchants, and thus obtain a reputation which promotes their business. English and German manufacturers produce goods for this class of retailers, marked to order, or having no brand.

#### **Trade in Musical Instruments and Household Goods.**

There was an increased trade in the American player mechanism introduced into British-made pianos. For American pianos and player pianos of the highest class the demand was steady. The organ trade also improved somewhat, and the sale of American harps was much above the average of the last five years.

The trade in American household articles more than held its own last year, especially kitchen utensils and furnishings, elastic extension and multiple unit bookcases, carpet sweepers, heaters, etc. American carpet sweepers have long held the premier position in public favor, due primarily to the fact that they have not been successfully copied by foreign manufacturers, and also, in the opinion of a prominent dealer, to "enterprising methods of distribution, a persistent and steady publicity being afforded them by continuous advertising in the daily press and among retailers." Smokeless oil heaters found a ready market, the quality being excellent and the prices somewhat lower than the same grade of British make. Cotton house gloves increased in demand.

#### **Tin and Brass Goods, Wooden Ware, and Timepieces.**

A leading retail dealer stated that American tin, japanned, and enameled ware appear to have lost their hold on the Edinburgh market, because importing firms do not appear to be able to handle this class of goods at a profit. American brass goods were at one time sold on this market, but practically all of the common products of brass and tinned sheets are now supplied by Germany and England, Germany having the advantage in every article in which low labor cost is the controlling factor.

Sales of American ash and hickory handles were satisfactory; also of beehives and fittings. There should be a greater advance in the sales of American wooden goods.

The trade in American low priced grades of watches increased considerably. Of other grades the sales were about the average. There was a decreased demand for cheaper clocks, in favor of the better qualities. Sales of clocks have always been of little importance in this market, compared with the trade in watches.

#### **Sales of Canned and Dried Goods.**

The trade in American canned and potted meats was much curtailed on account of the high prices ruling. Six-pound cans of corned beef, an important article with grocery and provision dealers

here, were supplied by Australia and Argentina to a greater extent than ever before. Beef from these countries was 15 to 20 per cent cheaper than the American product.

Canned apricots, pears, peaches, and tomatoes, though prices ruled high, showed no falling off. Apples were in stronger demand than in 1910. There were increased sales of dried fruit—prunes, apricots, pears, and peaches. In California and Oregon prunes the increase was large in consequence of the unusually short crop of French plums. Higher prices of apples affected sales somewhat. There was an increased sale of canned sweet corn, which some dealers regard as an indication that this article, which has seemed to be unsuited to the Scotch palate, will gradually come into general favor.

#### **Increased Receipts of American Apples, Meats, and Flour.**

On account of the large American crop, the trade in barreled apples in 1911 was the heaviest for many years. There was a marked improvement in the packing and also in the grading, and Scotch wholesalers are hoping that a system of grading will be adopted by American packers on the Canadian basis, which would relieve the trade of much of the uncertainty that now affects all transactions in American barreled fruit. Boxed apples were in high favor, and, as a rule, reached the market in fine condition. The prospects for developing the apple trade are promising. There was a large increase in the sales of pears, particularly for cooking purposes.

Wholesale firms report an increase of 20 per cent in the sales of American hams as compared with 1910, due to somewhat lower prices; also an increase of 20 per cent in the sales of lard. For lard substitute, i. e., a compound of cottonseed oil and refined beef fat, the demand was strong throughout the year. The trade in flour during the greater part of 1911 was rather dull, but with the new crop trade conditions improved, more particularly in special grades milled in Kansas and Nebraska, which came in at moderate prices and gave fair satisfaction. Northwestern flour was much dearer than Manitoban of corresponding grade, and soft winter flour was undersold by the product of British mills.

Imports of cheese from the United States were exceptionally light, owing to the American demand, and Canadian and home products were substituted.

#### **Imports of American Toilet Goods, Stationery, and Toys.**

There was a marked increase in the imports of American toilet goods—soaps, tooth pastes, powders, tablets, and various specialties—due to their superior quality and also to constant advertising. Some classes of American goods handled by chemists have become staple articles in the trade.

The trade in stationery, consisting of pens, paper clips, and certain kinds of paper, was normal, but there was a decrease in the imports of American pencils, probably due to the fact that one of the American pencil companies has a factory in England.

American toys, especially for the holiday trade, sold freely and yielded fair profits to the leading dealers. But German makes of new devices and of staple goods were more largely in the market, and at lower prices obtained the bulk of the trade.

**Sales of Dental, Optical, and Surgical Goods.**

Dealers report a moderate business in American dental engines and instruments. There were also fair sales of compressors, atomizers, tubing, wax, cavity lining, impress rubber, abscess cure, etc.

Sales of optical goods, such as gold-filled spectacles and eyeglasses, increased. The demand for American nickel-plated and solid nickel frames and also for plain steel frames was steady. There was only a moderate call for field glasses and microscopes. These goods are all obtained by the local dealers through wholesale houses in London or Birmingham.

The trade in American surgical instruments was practically the same as in 1910. There was a greatly increased demand for a "never-slip" glove, used by surgeons and, to a less extent, by dentists, and the trade suffered somewhat owing to the delay in delivery of orders. There was a steady call for various other appliances supplied to the retailers through London wholesale agents.

**American Sporting Goods on the Market—Hardware, etc.**

An average business was done in American sporting goods, such as boxing gloves, punching bags, ice skates, air guns, elastic knee and ankle bandages, tennis goods, and tents and other camping equipment. Roller skates had a greatly diminished sale on account of the general decline of "rinking" in this country.

Sales of galvanized fencing and barbed wire increased considerably. American lawn mowers maintained their leading position against the strong competition of British made machines, which have been improved during the last few years. There was the normal trade in saddlers' hardware and also in food choppers and other special articles. Fair sales of American builders' hardware—locks, keys, hinges, etc.—are reported. Owing to long depression in the building trades in this district, the demand for materials, etc., has been light for several years.

A large retail firm stated that there is a strong German competition in east Scotland with the sale of American and English malleable cast fittings, steam jointing, springs, bolts and nuts, gun metal valves, gas and electric light equipment, and various other machine fittings and engineers' supplies, and that the Germans have something to offer at a much lower price than the American and English make; that although the firm preferred to handle the American goods of excellent material and of fine finish, a large number of customers preferred the cheaper priced articles.

**Popularity of American Printing Machinery, Marine Engines, etc.**

There was no marked change in the demand for various machines for the printing trade, which is an important industry in Edinburgh. A large number of American presses, binders, stitchers, etc., are in use here, and any new American labor-saving device is promptly added to the equipment of the large printing establishments. The sales last year consisted of standard machines for enlarged plants.

There were also sales of shoemaking machines. Power and hand pumps had a fair sale, and there was a greatly increased inquiry for American marine engines, which, according to a prominent dealer, are in high favor on account of their excellence and comparatively low cost. This dealer informs the writer that American prices in

this line "can not be met by competitors," and that if the foreign trade is well managed, there is no reason why it should not grow to large dimensions. In electric power machinery the American electric companies having manufacturing plants in the United Kingdom had a satisfactory business last year, due mainly to the extended use of electricity in mining; but so far as can be ascertained, electric coal cutting machinery, etc., manufactured in the United States did not come into this market, in which the competition of British companies is extremely keen.

**Competition in Sales of Agricultural Machinery—Office Supplies.**

There was an average demand for American agricultural machinery, such as binders, mowers, chilled plows, and cultivators. Profits were much narrowed by the sharp competition of British manufacturers. The prices of English binders were somewhat lower than for the American make, and as the English makers sell directly to farmers, only the superiority of the leading American machines enabled dealers to hold their usual share of the trade. In horserakes, cultivators, and plows the business was well maintained, considering the restricted market. Any expansion of the agricultural implement trade in this country must be slow, for it can only be brought about by the gradual breaking up of great estates.

The sales of American roll-top desks were normal during last year, but the trade in card index cabinets, filing cases, etc., increased.

A leading firm in these lines says: "There is, in our opinion, a good market for many other American office appliances, if the manufacturers had distributing agents in important trade centers on this side." Most of the articles in this line are sold through agents in London.

**American and British Shoes on the Market.**

The local retail boot and shoe stores of American manufacturers had a fairly satisfactory business last year in leather footwear, but the volume of trade in the district was far below that of the preceding two or three years. The decrease was due almost wholly to the fact that British boots of American shapes, made on American lasts, are put on the market. A prominent wholesaler said: "I do not stock American made boots any longer, as the British makers have now come up to a high standard of manufacture." Another leading wholesale firm said: "We used to import a fairly good quantity of ladies' boots and shoes, but during 1910 and 1911 home productions met our requirements, and we discontinued our purchases from the United States. We had no fault to find with the American goods." Two other important wholesalers who were interviewed made similar statements. With the same machinery and much cheaper labor, British boot manufacturers are making this market of doubtful value to American competitors except in special lines. Owing chiefly to mild winters and fine weather conditions generally during the last two years, the demand for American rubber shoes has fallen off.

**Exports to United States and Insular Possessions.**

The value of the merchandise invoiced through the Edinburgh consulate for the United States during last year was \$1,352,825, an increase of \$68,539 compared with 1910. The items showing the

greatest gains were potatoes and whisky. The following were the articles and their value for 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Ale.....	\$12,984	\$13,027	Paper.....	\$6,528	\$6,289
Books (printed sheets, etc.).....	122,441	92,043	Paper stock.....	22,580	22,648
Cards (picture post cards).....	22,479	18,974	Pictures and frames.....	4,336	6,589
Fertilizer (sulphate of ammonia).....	74,909	65,784	Plates, stereotype.....	3,731	3,612
Furniture.....	25,085	21,631	Potatoes.....		80,142
Fuel oil.....	21,018	18,623	Printers' blankets.....	3,226	3,004
Gelatin.....	19,229	23,256	Rubber-proofed goods.....		1,914
Glassware.....	860	2,020	Sailcloth and tarpaulin canvas.....	1,265	4,346
Grindstones (Craigleith stones, etc.).....	11,773	5,886	Seeds.....	17,626	34,396
Hair, goats'.....	2,770	3,972	Tobacco.....	2,637	2,511

			All other articles.....	22,985	15,737
			Total.....	1,284,286	1,352,826

Hawaii is the principal American dependency in the shipments from this district, and there was a large gain in the total exports to that island last year due to increased shipments of fertilizers (sulphate of ammonia). The total value of the exports to Hawaii was \$331,672 against \$212,197 for 1910, and the principal items were: Fertilizer \$292,454, whisky \$9,222, iron and steel \$5,329, fire bricks \$1,613, and hardware \$1,294. The exports to the Philippines amounted to \$14,899, of which whisky represented \$12,678, and to Porto Rico \$3,135, made up of woolen and worsted goods and whisky.

The returned American goods were valued at \$11,817, of which \$9,976 represented furniture.

#### Trade of Leith.

The total number of vessels entering the port of Leith during last year was 7,366, with a tonnage aggregating 2,530,000. The following table shows the principal imports into and exports out of the port for 1910 and 1911, in long tons:

Items.	1911	1910	Items.	1911	1910
IMPORTS.			EXPORTS.		
Grain.....	Tons. 368,753	Tons. 317,301	Coal (cargo).....	Tons. 1,608,831	Tons. 1,708,318
Flour, etc.....	95,728	58,677	Coal (bunker).....	310,274	335,507

Fertilizer.....	62,980	59,396			

[From the London Times.]

#### Water Power in Scotland.

According to a paper contributed to the Inverness Scientific Society, Scotland is estimated to possess 1,000,000 horsepower from water, and it is pointed out that even if the figure be halved it would still represent, on a 10-hour working day basis throughout the year, an amount of power equal to that obtained from three and one-half million tons of coal. On a plan accompanying the paper are marked over 40 localities where water power is believed to be available in amounts ranging from 400 up to 20,000 horsepower, and the list does not claim to be complete. The calculations have been made on the assumption that the rainfall amounts to 42 inches a year, and that two-thirds of this amount is available for power; and in order to guard against

overstatement 25 per cent of the theoretical calculated amounts has been deducted. In regard to Inverness it is pointed out that if the rainfall in the 700 square miles that drain into the River Ness were retained in Loch Ness by controlling the overflow into the river, it would be possible by employing the Caledonian Canal as a flume or conduit to convey the stored water to the town and utilize it there for the development of 3,000 horsepower during the working days of the year, while yet supplying sufficient water to the river to maintain the normal summer flow. Another attractive drainage area for power purposes is that of Loch Luichart, having an area of 149 square miles. The river flows out of the loch in a series of cascades, and falls 125 feet in 850 yards. On a 75 per cent efficiency, and dealing with half of a 42-inch rainfall as available for power, 1,580 horsepower, on a 24-hour power day, could be developed. This would be fully 3,000 horsepower per working day, and even if no water flowed into the loch for six months, a sufficient quantity of water could be stored to give this quantity of power for six months by raising the level of the loch 36 feet, and the water would all be returned to the river again within a half mile of the loch. The raising of the loch could be easily done, as the outlet is through a narrow rocky gorge. The power could be taken to Inverness by a high voltage transmission line. The cost of the necessary pipe lines, generating plant, buildings, and transmission line to Inverness, but excluding water rights and way leave, would probably amount to £40,000 (\$195,000). Even 1,000 horsepower used industrially would provide employment for 3,000 workers in Inverness, representing an increase in the population of probably 15,000 people, and with the fine facilities for shipping at its harbor and Thornbush Quay, and the abundance of open ground on both sides of the river mouth, suitable for factory sites, and readily accessible by railway, the town is in an eminent degree suitable and desirable for such an industrial development.

### AMERICANS INVITED TO GERMAN EXPOSITIONS.

#### International Building Exposition at Leipzig.

With reference to the International Building Exhibition to be held next year at Leipzig, as announced in Daily Consular and Trade Reports for June 4 and March 20, the Department of State is in receipt of the following note of invitation from the German Ambassador at Washington:

The exposition, from the standpoint of finance and organization, must be considered as an important undertaking worthy of participation. The interest which His Majesty the King of Saxony has shown by assuming its patronage, the fact that it enjoys the utmost good will of the State and city authorities, as well as that of the leading professional men and corporations, and, lastly, the financial support promised by the city of Leipzig, jointly with the citizens, afford a guarantee that the exposition will be carried to a worthy and successful completion.

By direction of the Imperial Government I have the honor to bring the foregoing to Your Excellency's knowledge, and at the same time extend the invitation of the management of the exposition.

#### International Art Exhibit at Munich.

The German Ambassador has transmitted to the State Department copies of the regulations governing the Eleventh International Exposition of Art to be held in the Royal Crystal Palace of Munich from June 1 to October 31, 1913. The exposition is being organized by the Munich Federation of Artists, in conjunction with the Munich Secession, a society of the younger and more modern artists, who seceded from the older organizations and who in this exposition, as in others of a similar nature, will have a separate section with its own jury and hanging committee. Works of art in the different branches—painting, sculpture, architecture, engraving—and works of art industry are admissible to the exposition, but the last mentioned can be admitted only by personal invitation of the central committee. First and second class gold prizes will be awarded. The German Ambassador expresses the hope that the United States will take part in the exposition by sending a collective exhibit and an official delegate.

**BELGIAN HIDE-TRADE METHODS.**

[From Consul General Henry W. Diederich, Antwerp.]

The Antwerp hide and skin market enjoys the reputation among the hide dealers of the world of being conducted on the very highest commercial principles. The unique conditions prevailing here are due to the efforts of a single firm, Grisar & Co., which does not handle hides but acts as official brokers between buyer and seller.

The great majority of hides imported at Antwerp are wet salted River Plate hides, which have in most cases been salted at the port of embarkation during loading. On discharge on the wharf at Antwerp the salt is carefully brushed from them, and I am given to understand that this method of freeing the hides from salt is far better than the mere shaking of the hides as practiced in London. After this process the hides are bundled and weighed and afterwards sorted according to weight into three classes and various subclasses. The supervision of this sorting is done by delegates of Grisar & Co., who see to it that any damaged hides which happen to be in the lot are put aside to be sold later on at a reduction. After the hides have been carted to the warehouse, the expert broker himself inspects all the hides, valuing them, and then entering their full description in a catalogue. This description is always absolutely accurate and fair to the buyers.

**No Consignments Reserved—Auctions.**

It is to be noted that the reputation of the Antwerp market is kept up by the fact that every hide that comes into the port is officially listed and open for sale as soon as it arrives. No merchant reserves any lots to favor a customer. The market is entirely open; and the fact that all the hides, from whatever source, are controlled by the official brokers, establishes such a confidence in the market that foreign buyers frequently purchase merely by catalogue without counterinspection or examination.

Sales are made either between buyer and seller direct or by the intervention of the official brokers, when Antwerp buyers or sellers only are concerned. When foreign buyers apply to the official brokers, they are referred by them to Antwerp dealers or commission houses.

Auction sales are held only when the market is overstocked.

**UNIFICATION OF MANCHURIAN WEIGHTS AND MEASURES.**

[From Consul Albert W. Pontius, Dainy.]

The Dairen (Dainy) Business Men's Association has submitted to Civil Administrator Aiga its opinion relative to the unification of the standards of Manchurian measures and weights, as follows:

1. Whereas the weights and measures now in use at Dairen are of both Japanese and Chinese make, and as the Chinese manufactures are more or less incorrect in the majority of cases, it is advisable to suspend their use altogether and to permit none but Japanese manufactures to be employed in all commercial dealings.

2. Such weights and measures as were made in Japan and are on sale at Dairen must, of course, have passed the formal inspection and been approved. It is desirable that they should be further subjected to the examination of the civil administration authorities.

3. As the measures and weights which have been approved are liable to derangement from one cause or another, they should be subjected to a periodical inspection once a year.

**FOREIGN TARIFFS.****CUBA.**

[From the Cuban official treasury bulletin, May 15, 1912.]

**Special Reductions in Rates of Duty.**

The Cuban Government has authorized exemption from the surtax for a number of articles to be used for industrial purposes. Bristol board, fine cardboard, cardboard covered with fancy paper, etc., dutiable under tariff No. 162A, is henceforth subject to the following rates of duty: \$3.50 per 100 kilos, general rate, and \$2.45 per 100 kilos, preferential rate to the United States. Other cardboard, and cardboard covered with ordinary brown paper, dutiable under tariff No. 162B, is henceforth subject to the following rates of duty: \$1 per 100 kilos, general rate, and \$0.70 per 100 kilos, preferential rate to the United States. Machinery and apparatus imported by the Cuban Coal Co. (Compañía Carbonera de Cuba) and the Cuba Copper Co., under tariff No. 226, is to be dutiable at 20 per cent ad valorem, general rate, and 16 per cent ad valorem, preferential rate to the United States.

These exemptions from the surtax apply only when the articles specified are imported direct by those engaged in the industries specified in the decrees, for use in their own industrial establishments.

---

**CANADA.**

[From Consul General John G. Foster, Ottawa.]

**Temporary Reduction on Cement and Bags.**

By an order in council passed June 8, 1912, it was provided that from June 12 to October 31, inclusive, the Canadian import duty on cement and cement bags (tariff Nos. 290, 291) should be one-half the amounts specified in the tariff. [The general rate on cement is 12½ cents per 100 pounds, on cement bags 20 per cent ad valorem.]

---

**NICARAGUA.**

[From Consul James W. Johnson, Corinto.]

**Distillation and Exportation of Brandy.**

By a decree of April 10, 1912, the restrictions on the establishment of new brandy (aguardiente) distilleries, and on the exportation of brandy from Nicaragua, which had been in force since the end of 1910, are removed.

---

**PORTUGAL.**

[From Diário do Governo.]

**Importation and Exportation of Olive Oil.**

By a decree of April 24, 1912, the Portuguese Government reduced the rate of duty on olive oil from 150 reis to 80 reis per kilo (from about 15 cents to about 8 cents per 2.2046 pounds). This special reduced rate of duty is to remain in effect until the end of October, 1912.

The Government has also put in force a set of regulations regarding the exportation of Portuguese olive oil. [Copies of these decrees, in Portuguese, are on file in the Bureau of Manufactures.]

## RUSSIA.

[From Board of Trade Journal, May 23, 1912.]

**Rates on Agricultural Machinery and Parts.**

On May 19, 1912, the Russian Government promulgated a measure reenacting the provisions which were in effect up to April 14, 1912, whereby agricultural machinery and parts were admitted free of duty or at specially reduced rates. These provisions had lapsed, owing to the failure of the Duma to adopt legislation on the matter prior to April 14. [See Daily Consular and Trade Reports for May 10, 1912.]

## VENEZUELA.

[From Consul Thomas W. Voetter, La Guaira.]

**Tariff Classifications.**

The following articles, not specially mentioned in the customs tariff of Venezuela, have been classified by the customs authorities and are subject to the rates of duty set forth below:

White cotton tapes 3 centimeters wide, for use with printing presses, class 4, including surtaxes, 10.3 cents per pound.

Grape sugar and milk sugar, class 5, including surtaxes, 17 cents per pound.

Woven cords of cotton, flax, or hemp, 4 to 14 millimeters in diameter, class 4, including surtaxes, 10.3 cents per pound; same, less than 4 millimeters in diameter, class 5, including surtaxes, 17 cents per pound.

Catalogues free.

## TASMANIAN TRADE NOTES.

[From Consul Henry D. Baker, Hobart.]

*A State agricultural farm* is to be established in Tasmania. Parliament having appropriated \$55,000 therefor.

*Stud sheep exports.*—A shipment of 117 stud merino ewes and 2 rams has left Hobart for Durban, South Africa, the largest consignment of stud sheep which has ever left this island. These sheep were specially selected by representatives of South African sheep breeders.

*Tar spraying machine.*—The city council of Hobart has imported from London a \$1,160 machine for spraying the streets with tar to prevent dust. It contains a furnace which heats the tar to boiling point and applies it under pressure generated by an air pump. It was found that the machine was too heavy to be drawn by horses and inquiry is being made for a small motor powerful enough for the purpose.

*New woolen mill.*—One early result of the cheap hydroelectrical power available in Hobart after January 1, 1913, will be a new woolen mill for making blankets, tweeds, etc. A 3½-acre site has been purchased. It is understood that it will be an offshoot of the Australian Woolen Mills Co., of Sydney. The Commonwealth of Australia may also erect a woolen mill at Hobart for making military uniforms, etc.

*A night telegraph letter service* was inaugurated by the British Post Office on June 1. The rate is 12 cents for 36 words and 1 cent for each additional word.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 9006. Hotel furnishings and equipment.**—An American consul in a European country reports that a new hotel is being constructed in his district. It will contain 850 rooms, each with dressing rooms and bath. While all the materials used in the construction of the building will be of local origin, it is possible that American firms may secure orders for some of the hotel furnishings and equipment. Name of person to be addressed regarding this matter can be obtained from the Bureau of Manufactures.
- No. 9006. Vacuum pans and evaporators.**—A foreign business man has informed an American consulate that he desires to get in touch with American makers of vacuum pans and single and multiple evaporators for packing-house work.
- No. 9010. Tobacco and tobacco seed.**—A report from an American consul states that a manufacturer's agent in his district desires to establish connections with American exporters. Being an expert in tobacco, he is particularly interested in the leaf-tobacco trade and would appreciate correspondence from dealers in seed leaf and Virginias.
- No. 9011. Motor cars and accessories.**—The manager of a motor-car company in Australasia has informed an American consulate that his company would appreciate catalogues and price lists of American motor car and accessories manufactures. The firm is prepared to handle all kinds of cars, including electric truck wagons, and is open to accept agencies for Australasia. Correspondence is invited.
- No. 9012. Equipment for Pasteur institute.**—A foreign Government official is planning the establishment of a Pasteur institute as a memorial to a late member of his family. It is understood that a considerable sum will be devoted to this purpose. Proposals for equipment should be addressed to this official by interested American firms.
- No. 9013. "Efrosite."**—An American consular officer in France reports that a firm in his district desires to know the name of the American company selling a product called "efrosite," which is described as a variety of white clay, as it is anxious to import this product.
- No. 9014. Chaff cutter.**—The Bureau of Manufactures is in receipt of a communication from an American electrical engineering firm stating that one of its clients requires a chaff cutter suitable for driving by power, for which purpose it should be supplied with a stock-size pulley, keyed to the shaft, to drive by an electric motor and belt. The machine should be arranged so that the length of cut can be altered and be fitted with toothed rollers, steel face, and rising mouthpiece. It should be large enough to cut sufficient hay for 8 or 10 mules in one hour. It is advisable that it be fitted with a guard to prevent injury to the hands of the operator.
- No. 9015. Christmas goods and novelties.**—American manufacturers and exporters of holiday goods, such as toys and Christmas novelties of all descriptions, are requested by an American consul to forward catalogues and price lists of these lines to his office. If furnished, the catalogues should be forwarded at the earliest possible date in order that anyone wishing to order from them may be able to procure goods in sufficient time for the Christmas trade.
- No. 9016. Tin andterne plate.**—An American consul reports that there is a demand in his district for American tin andterne plate, the market at present being supplied largely by British houses. One of the largest local plants for the manufacture of tin andterne plate boxes and cases is very desirous of corresponding with American exporting concerns willing to supply this demand at reasonable prices. This concern states that it purchases 6,000 to 7,000 cases of tin andterne plate every year and would be pleased to buy from the United States instead of Great Britain if terms are favorable.
- No. 9017. Horn refuse.**—A manufacturer of fertilizer in Germany desires to buy horn refuse (hornabfallen). He requests an American consulate to secure offers of large amounts with prices. Correspondence in German is preferred.

## PROPOSALS FOR GOVERNMENT SUPPLIES.

[No further particulars are available in the Bureau of Manufactures regarding these projects. Correspondence should be direct with the officers named.]

- No. 688. Willows.**—Sealed proposals for furnishing willows at South and Southwest Passes, Mississippi River, will be received at the United States Engineer Office, Room 325, Customhouse, New Orleans, La., until June 20. Information on application to Lansing H. Beach, Lieutenant Colonel, Engineers.
- No. 689. Brick building.**—Sealed proposals will be received at the Indian Office, Washington, D. C., until July 17, 1912, for furnishing materials and labor for the construction of an addition to brick school building at the Salem Indian School, Oreg., in strict accordance with the plans, specifications, and instructions to bidders, which may be examined at the Indian Office; the office of the Supervisor of Construction, Denver, Colo.; the Oregonian, Portland, Oreg.; the Capital Journal, Salem, Oreg.; the American Contractor, Chicago, Ill.; the United States Indian warehouses at Chicago, Ill., St. Louis, Mo., and San Francisco, Cal.; the Builders and Traders' Exchanges, Minneapolis, Minn., and Omaha, Nebr.; and at the school. For further information apply to the Superintendent of the Salem Indian School, Chemawa, Oreg.
- No. 690. Plumbing system at post office.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until June 24 for a new plumbing system at the United States post office, Rock Hill, S. C., in accordance with the specification and drawing, which may be obtained from the custodian at Rock Hill or at the office of the Supervising Architect.
- No. 691. Ice-making and refrigerating plant.**—Sealed proposals will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until July 13, 1912, for a steam-driven ice-making and refrigerating plant, complete with all accessories, and with superintendence for its installation, at the naval station, Guantanamo, Cuba. Plans and specifications can be obtained on application to the bureau or to the commandant of the naval station named.
- No. 692. Electric-elevator plant.**—Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until June 24, 1912, for the installation complete of a new electric-elevator plant in the United States courthouse and post office, Pittsburgh, Pa., in accordance with drawings and specifications, copies of which may be had at the office of custodian, Pittsburgh, or of the Supervising Architect.
- No. 693. Medical supplies.**—Sealed proposals, in duplicate, will be received at the Field Medical Supply Depot, United States Army, 21 M Street NE., Washington, D. C., until June 27, 1912, for medical supplies, including the following: Aspirom, cocaine hydrochloridum, digitalinum, iodum, medical chests, alcohol stoves, buckets, galvanized iron buckets, hand washbasins, gray enameled dippers, lanterns, litter slings, hospital-corps pouches, canvas cases for bedding, cotton pillowcases, cotton sheets, pocket cases, hypodermic syringes, Hodgen's splints, bottles, rubber stoppers, tins, lantern globes, etc. Specifications and particulars can be obtained from Maj. C. R. Darnall, Medical Corps, in charge of depot.
- No. 694. Traveling cranes.**—Sealed proposals will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until July 6, 1912, for 4 electrically and 18 hand-operated traveling cranes for the naval station, Pearl Harbor, Hawaii. Plans and specifications can be obtained on application to the bureau or to the commandant of the naval station named.
- No. 695. Oil-burning plant for heating boiler.**—Sealed proposals will be received by the Supervising Architect until July 15 for an oil-burning plant for heating boiler in the United States post office at Fresno, Cal. Specifications can be had of custodian at Fresno or of the Supervising Architect.
- No. 696. Medical supplies.**—Sealed proposals will be received at the Medical Supply Depot, 543 Greenwich Street, New York, N. Y., until June 17 for certain medical supplies, including ether, adhesive plaster, etc. Specifications can be obtained by writing the officer in charge of the depot.

**NEW WEST INDIAN CULTURE BANK.**

[From Consul General S. Listoe, Rotterdam.]

An enterprise which will materially contribute to prosperity in the Dutch West Indies will soon be realized in the establishment of a "culture bank" for said colonies, the matter having been under consideration at different times in recent years.

Cooperation was first sought with the West Indian interests represented in various colonial enterprises at Amsterdam, but the fact that the proposed bank would conduct its business mainly with the West Indian plantation owners, did not interest the Amsterdam parties. It has now been arranged that the new bank will be controlled by Rotterdam interests—with the exception of one Amsterdam firm—under the auspices of the Rotterdam Bank Society.

The new bank's principal object of becoming a credit institution for agricultural interests will be strictly maintained, and only secondarily will it give attention to business of a general credit bank. The capital will be \$600,000, divided into \$400,000 preferred and \$200,000 common stock; the former will be taken by a syndicate, of which the Rotterdam Bank Society is the leading factor.

After discussing the matter for some time with Government officials, it has been decided to submit a bill to the Legislative Chambers of the Netherlands, to the effect that the Treasury Department of this country will be authorized to subscribe for the common shares of the bank's capital, which shall guarantee an annual dividend of 5 per cent for a certain number of years on the preferred stock.

---

**PLUMBING SUPPLIES FOR CHINA.**

[From Consul General Samuel S. Knabenshue, Tientsin.]

Inquiry is made as to the possibilities of selling plumbing supplies in Tientsin, as well as in other Chinese cities. The market for such supplies is so far limited to Tientsin and Peking; and in these chiefly to the residences of foreigners, to the leading hotels, business houses, public offices, etc. The vast mass of Chinese structures have no plumbing at all. Peking and Tientsin are the only cities of North China which have waterworks. In the native city of Tientsin there are public hydrants at even distances along the streets, and the people carry their supplies from these in pails. The same is true of Peking. Few Chinese residences have plumbing arrangements as yet.

The above is not said in a spirit of discouragement, but rather to show how enormous the field will be for plumbing supplies when the business is properly pushed. What is needed is some American house to send out a man to act as a missionary in this business. There are houses here in Tientsin which import plumbing materials, but they keep hardly any stock on hand. I think that possibly there are on sale at present, in the foreign settlements of Tientsin, not over a half-dozen heaters for water for stationary bathtubs, etc. Anything more elaborate is ordered from Europe or from the United States.

---

The Montreal city council has approved the proposed construction of a \$649,000 annex to the City Hall.

## MOVING PICTURES ABROAD.

### ENGLAND.

[From Vice Consul Rice K. Evans, Sheffield.]

Sheffield has 17 cinematograph theaters, whose total intake is about \$7,300 per week. It is estimated that they expend an average of \$1,460 a week in the rental of films.

Films are imported by the manufacturers' agents, located in London, by whom they are exhibited to managers of cinematograph houses. Some weeks before the release date they are bought by film-renting firms at an average price of 4d. (8 cents) per foot. These renting firms then offer them at auction to the playhouse managers at various prices per week rental. So keen has the competition in these auction sales become that the price of films has advanced 100 per cent within the last year or so, during which period the manufacturer's price has not risen at all. Houses of good financial standing pay quarterly for the films received; others pay on receipt of goods.

It is estimated that the life of a film is five to six weeks' running. Of course, they are run much longer, but they deteriorate with use. This, together with the keen competition for the newest goods, makes a difference of 20 per cent between the price for the first run and the second run; 15 between the second and third run; and so on down as the film is more used and becomes more generally known. It is said to be quite the usual thing for a film to go out on its seventh run at a rental of 50 per cent less than it brought on its first time out.

### The Middleman's Profits—Subjects.

It is said that a film that goes out six times nets the middleman who bought it from the makers 100 to 150 per cent. Hence the managers would gladly do away with the middleman and rent direct from the agents.

More than 60 per cent of the films used in this city are American. Italian films come next, amounting to about 15 per cent; the French 10 per cent, and British-made films 6 or 7 per cent. The reason given

for the popularity of the American-made film is not that the photography is any better, but rather that the subject matter at present suits the popular taste. The American film generally portrays the so-called western drama, with stirring, forceful action, put on in the open. The French films tend more toward the comic, with close work, where facial expression and detail count. In the field of historical subjects in color the French makers easily excel. The Italian films have come on rapidly during the last year. In photography they are easily equal to the best, and in subject matter they are pioneering a new field, viz, weaving a minor plot about stirring historical events. They are also producing a class of very popular pictures dealing with actual events, where the action is rapid and exciting, as, for instance, swimming Italian cavalry horses.

The greatest advance, however, as far as the British market is concerned, has been made by the British manufacturers. Their photography has improved, and their subject matter is of the higher level which the cinematograph shows are approaching. In a broad way it may be said the English makers are tending toward the military drama, maneuvers, and street scenes, and are generally along a high plane in that they educate and enlighten.

#### Changing Demands of Moving-Picture Audiences.

Five years ago the popular film was the home drama, where the action was built on a purely fictitious plot. Roughly speaking, two years ago the American cowboy came on the stage and rapidly became the popular hero of the moving-picture palaces. His erstwhile favor is now somewhat on the wane, and, though no bill is complete without him, he is not to-day the popular idol that he was six months ago. More and more is there a demand for real people and real things. Managers confidently state that the day is coming when the tragedies of history as subject matter will supersede entirely the mythical battles of the cowboys and "bad men" of the western plains, and the moving-picture entertainments of the future will run more and more to the educational and instructive. To-day a manager considers a bill incomplete if it does not include at least one scientific film, such as a set of pictures dealing with bird or animal life, industrial or commercial welfare.

In many picture houses films entitled "The Happenings of the Week" are now shown. These features were at first rather undervalued, but their popularity has so grown that now no manager can afford to omit them. The subjects are the political, social, and other news events of the week just passed, and the moving-picture public has come to enjoy seeing their newspaper stories of yesterday enacted on the screen.

---

#### JAPAN.

[From Deputy Consul General F. R. Eldridge, Jr., Yokohama.]

Moving pictures are very popular in Japan. Once established, the business has continued to increase, and each year has witnessed the expansion of the enterprise.

Up to the present time most of the machines in use in Japan have been imported, although recently the manufacture was inaugurated on a very small scale. The chief virtue of these domestic-made machines seems to be their cheapness. One company, the Japan Cinematograph Co., manufactures a machine complete for \$45. The

cost is distributed as follows: Main lantern, \$22.50; 3 to 5 inch lens, \$2.50; arc lamp, gas tank, and all other appliances, \$20.

That these machines are unsatisfactory is evidenced by their scarcity and the continued importation of foreign-made machines. Germany comes first as an exporter of cinematographs to Japan, followed by France, England, Italy, and the United States. The makes imported have been New Urban "P. P.," Pathé's Reliable, Gaumont's M. C. Chrono, and the Edison.

#### **Criticism of American Machines—Film Imports.**

In commenting upon the American machines, one large importer states:

So far as the exhibition of the pictures on the canvas is concerned, the American machines do just as well as any other make, but they have the defect of wearing out the films much more quickly. Being a great manufacturing nation, we are sure that the United States can produce just as good machines as any other country; and if they are made cheaply enough they can be sold in great numbers in this country, for we alone can take at least 60 of them a year.

Of the 83 moving-picture halls in Japan 42 are owned by Pathé & Co. The number of halls in operation is increasing almost 50 per cent a year, but how long this ratio will be maintained it is hard to predict. In addition to the regularly established halls there are numerous traveling companies which visit the halls in the country districts about once every six weeks, generally exhibiting two days in each place.

There are nearly 2,000,000 feet of moving-picture films imported into Japan every year. The imports of Pathé & Co. in 1910 were divided as follows: United States, 720,000 feet, both negative and positive, from the Eastman Co.; France, 72,000 feet, tinted and untinted; Italy, 60,000 feet, from Itara & Co., 36,000 feet of Ambrosio films, and 36,000 feet of Mirano films, all untinted; Great Britain, 36,000 feet, from Urban Trading Co. The Yokota Shokai, in addition to manufacturing 150,000 feet of Japanese films every year, imports 250,000 feet from American, French, and English manufacturers.

#### **Subjects Favored—New Halls Being Opened.**

The most popular kinds of pictures in Japan are pictures portraying: (1) Heroism, e. g., the story of a warrior fighting for righteousness; (2) pathos, e. g., the story of a son whose father has lost all his fortune and who strives hard, enduring many difficulties, to support and help his father; (3) magic; (4) comedy; (5) educational; (6) scenic. The kinds of films that are not welcomed in this country are: (1) Love affairs; (2) pictures of policemen or Government officers fooled or mocked by the people; (3) pictures which instill revolutionary ideas in the heart of the youth.

It seems to be the opinion here that American films are satisfactory as to quality of the film, but that the actors are inferior to those of other countries, especially as regards comedy and magic.

Numerous trade opportunities are being continually offered to this trade in Japan, and recently plans have been formed to utilize the foreign amusement hall in Yokohama as a cinematograph theater, leasing the films from a Manila agency. Japanese motion-picture halls are being opened in great numbers and all must be supplied with machines and films, and so far as the films are concerned a majority of these must be supplied from abroad.

**CHINA.**

[From Consul General Samuel S. Knabenhue, Tientsin.]

The moving-picture business is much more largely developed among the treaty ports in southern China—that is, from Shanghai southward—than it is in North China. In this consular district there is but one establishment using moving-picture films. This is the Arcade, located in the French concession, Tientsin. The entertainment here consists usually of the exposure of eight films during the evening, interspersed at times with turns from one or two variety actors. The house is a small one, the patronage not large, and the proprietors often omit the variety turns on account of the expense of bringing performers from the south. There was an amusement house of the same character in Peking, also called the Arcade, but it has been closed since last November.

The market for films and moving-picture machines is almost entirely in the hands of the Pathé-Phono-Cinema-Chine, whose head office is in Paris, with branches at Calcutta, Bombay, Hongkong, Tientsin, and Shanghai. This firm has a practical monopoly of the moving-picture business on the China coast and throughout the Far East generally. The Arcade here rents the films it uses regularly from this house. The films as a rule are sent from house to house along the China coast until they are worn out. Occasionally an American film is shown here, but it is always a secondhand one and is obtained from the above company.

Moving-picture shows are increasing in popular favor in South China, and the natives are evincing a great interest in them. So far this does not appear to be true of North China. However, there is no reason why a popular liking should not be built up among the Chinese if some firm would enter the business and provide traveling cinematograph shows to be exhibited in Chinese theaters in the various native cities of North China.

---

**STRAITS SETTLEMENTS.**

[From Vice Consul General D. Milton Figgart, Singapore.]

The principal towns of the Malay Peninsula are Singapore, with a population of 325,000; Penang, 277,841; Malacca, 124,029; Kuala Lumpur, 46,567; Ipoh, 23,354; Taiping, 18,000.

There are three moving-picture shows in operation in Singapore and about six throughout the remainder of the peninsula. The three in Singapore are Harima Hall, the Alhambra, and the Marlborough.

Pathé Frères supply both machines and films. The machines are from the English branch of this company, while the films are not only Pathé Frères, but various other makes. This company buys up from time to time films which it desires from other manufacturers and claims to have a monopoly of this market. It stocks about 3,280,000 feet of films and receives 3,000 to 5,000 feet of the new films each week. An operator has been in this district for some time, taking views of the principal industries and other interesting features, such as rubber cultivation, tin mining, crocodile hunting, manufacture of sago flour, etc. This operator also works in the surrounding country.

**American Films—New Theater Ordinance.**

As above stated, Pathé Frères claim to have a monopoly of the market, and will buy interesting films at their full value if necessary,

depending on the hiring out to the various shows for their profit. Many American films are shown at this time, especially those manufactured by the American Biograph Co.

A bill has been introduced into the Legislative Council amending the theater ordinance of 1908, which will provide for the examination by the chief police officer of every application for a license to carry on cinematograph exhibitions in the Straits Settlements. Such applications must be in writing and contain a description of every scene intended to be produced at such exhibition, and it is prohibited to advertise or produce any scene the description of which has not first been furnished to the chief police officer.

### TURKEY.

[From Vice Consul I. Montesanto, Trebizond.]

Trebizond has one fine theater for moving pictures, built for the purpose by the Trebizond Cinematographic Co. It occupies a corner lot adjoining the public garden and fronts on Liberty Square, the most central part of the city. The company has spent \$7,500 for the erection of this theater and \$5,300 for the two oil engines and the necessary electric accessories. The 9-horsepower, 2-cylinder group electric motor is from Aster, of Paris, the 12-horsepower transmission motor from Auto Dautz, and the dynamo from Gramme Co., also of Paris. The lamps are metallic filament, and there is also an arc lamp of 2,000 candlepower.

This theater has a seating capacity of 600, and it has plenty of doors, ventilators, fireproof projection-apparatus chamber, and other modern improvements.

#### Prices—Films.

Prices: Seats, 10, 15, and 20 cents; boxes, 80 cents and \$1 each, accommodating 4 to 6 persons. There is a stamp duty (2.2 cents) for each 20-cent ticket for the benefit of the Hedjaz Railroad. Five thousand feet of films are used for each show, and the program is changed twice a week. Each new program is duly advertised in four languages, Turkish, Greek, Armenian, and French.

The films are mostly of French manufacture, Gaumont and Pathé Frères, and sometimes American, of the Eclipse American Vitagraph Co., etc. The company receives the films from Constantinople and occasionally from Saloniki at a cost of 6 or 8 centimes (1.16 to 1.54 cents) a meter for each program. For American films the company would be willing to pay more, because they enjoy a great popularity and are always received with much enthusiasm by the people who are very fond of subjects like detective stories, cowboy and Indian life, etc., and they appreciate the clearness of the American films.

The show usually lasts 1½ to 2 hours, starting about 8 o'clock each evening. Two performances are given. There are no matinees except on fête days, so profits have to be made from night performances only.

#### Turkish Agency for American Films.

It would not pay for an American firm to send films only for the Trebizond theater, but there are many moving-picture shows in Turkey and several in this part of the country, and as their number is daily increasing there is a good chance for an American concern to

establish an agency at Smyrna, Saloniki, or Constantinople and have its films make the round of several moving-picture theaters. There is no doubt that American films will be preferred and that the business will prosper.

The moving-picture theater of Trebizond has installed an American pianola, made in Indiana, which was bought from the Constantinople agency for \$700, on monthly installments.

#### MEXICO.

[From Consul T. C. Hamum, Durango.]

There are at present two moving-picture theaters in Durango—Salon Golondrina and Salon Rojo. Both are members of regular film-exchange circuits, one with headquarters in Mexico City and the other in San Luis Potosi. The films are changed daily and 7 to 10 pictures are shown at each performance. Most of the films in use are imported from France, although a few, chiefly cowboy and "Wild West" pictures, are obtained from the United States. Some Spanish films depicting bull fights are shown.

The proprietor of the Salon Golondrina informs me that he attempted to import all his films from the United States, but that the length of time required and the uncertainty of regular shipment made the venture a money-losing proposition. He further stated that the explanatory matter was all printed in the English language, an innovation which proved anything but popular. A Powers machine of American make is the one now in use and is giving entire satisfaction.

In order to enter this market successfully three things at least are essential: (1) Prompt and continuous service; (2) a large variety of subjects; (3) all explanatory matter must be in the Spanish language.

#### HONDURAS.

[From Vice Consul Kenneth Stuart Patton, Ceiba.]

There are no moving-picture shows in Ceiba now (March, 1912). There was such a show here several months ago, but the enterprise failed on account of the inability to secure film exchanges and suitable quarters and because of the quality of the machine operated.

It might be feasible to bring a traveling motion-picture show to Ceiba, provided a change of program could be effected at every performance, or at least very frequently, and a suitable hall secured. At the present time there is such a hall, and a Spanish vaudeville company is showing there. It will probably remain only a short while. The best season of the year to start such a venture would be from March until August, these months being the time in which the fruit trade is at its liveliest and when the natives have more money to spend. Truxillo and Puerto Cortes are the only other towns on this coast that would be capable of supporting such an enterprise.

**Cost of Transportation a Factor.**

One could ascertain the cost of bringing the necessary paraphernalia here by consulting either the United Fruit Co., or Vaccaro Bros. & Co., both of New Orleans. These companies run the only steamers

between Ceiba and the United States. If the initial expense is heavy, it would not be advisable to undertake the risk. Vaccaro has a small electric plant here for his offices and shops and might be willing to supply electric power if such be feasible.

Admission might be placed at 10 and 20 cents. It would probably be impracticable to give more than four or five performances a week, and these should be at night, inasmuch as the population is a busy one.

In case any American firm try the venture, it would be well to bring along films and take pictures of trips up the beautiful tropical streams that run from the mountains to the coast through wonderful forests.

---

#### MALTA.

[From Consul James Oliver Laing, Valetta.]

Two methods of introducing the advertising into motion pictures have been employed. One is to show signboards advertising merchandise in the scenery or setting of a moving-picture drama. The other is to introduce the names of commercial exhibitors into films representing a country fair such as the well-known yearly fairs of England or a market scene such as the markets of Nizhni Novgorod. The display of the firm's name is followed by a series of pictures representing its exhibit at the fair or the working of its plant. Some criticisms have been made of the first method, the signs displayed (on account of incongruities of time, place, or situation) being sometimes ill adapted for association with the scenes in which they are placed.

---

#### INDIA.

[From Consul Edwin S. Cunningham, Bombay.]

The principal cities in this consular district are Bombay, with a population of almost 1,000,000; Ahmedabad, 186,000; Poona, 153,000; and Baroda, 1,000,000. There are five moving-picture shows in Bombay, four of which use Pathé machines and one a Gaumont. The majority of the films are of French manufacture, Pathé, as a rule, but other films are—Itala Co., Italy; Barker Motion Photography Co., London; Gaumont & Co.; Urban Manufacturing Co.; Cines Co., of Rome; Edison Co.; and Vitagraph Co. So far as I am advised, the American films are used by only one of the local theaters. There are no manufacturers of either moving-picture or cinematograph machinery in this district.

---

#### AUSTRALIA.

[From Consular Agent U. W. Burke, Fremantle, West Australia.]

The principal cities and towns of West Australia are Perth, the capital, with a population of 55,000; Kalgoorlie and Boulder, 29,000; Fremantle, 20,000; Midland Junction and Guildford, 6,000; Geraldton, 4,000; Bunbury, 4,000; and Albany, 3,000. Moving-picture shows are in operation in each of these places, the machines used being Pathé and Gaumont, and the films American, English, and French. Moving-picture machines are not manufactured in this State.

**SAMOA.**

[From Consul Mason Mitchell, Apia.]

Apia has a population of about 600 whites and half-castes, and the island, Upolu, has 22,000 natives. Moving-picture shows come from Australia several times a year, remaining a month, and then going to the Fiji or Tonga Groups. A local company was recently organized in Apia, which gives three shows a week. It uses a French machine and obtains its films from Sydney, Australia. The films are of American and European manufacture.

**THEATER-FIRE PREVENTION IN GERMANY AND FRANCE.**

[From Consul General A. M. Thackara, Berlin.]

The police regulations of the city of Berlin regarding the fire-prevention measures to be taken in theaters and other places where moving-pictures are exhibited are exceedingly strict and carefully enforced.

According to the police regulations of September 30, 1907, the booth in which the projector is installed must be made of either sheet iron or sheet steel and the sides and floor lined with asbestos at least one-third of a centimeter (0.13 inch) thick. New police regulations are in course of preparation. I am informed unofficially that under the new provisions the booth must be constructed with double sheet iron or sheet steel walls, with an intervening air space. In no case would booths constructed of angle iron and covered with asbestos boards be permitted in this district.

**Main Provisions of Police Regulations.**

A translation of the more important paragraphs of the 1907 Berlin police regulations for moving-picture theaters follows:

**SECTION 1.** Whenever moving pictures are exhibited in theaters, assembly rooms, stores, tents, or other public places, and inflammable films are used, electric or calcium light must be employed for purposes of illumination. Gas for the production of a calcium light must either be taken from the city gas mains or made in a safe generating apparatus which complies with the law.

**Sec. 2.** The electric or calcium lamp must be placed in a sheet-iron or sheet-steel booth, of which the bottom and sides are lined with asbestos. So far as will not interfere with the operation of the apparatus, the air holes in the booth must be covered on the inside with wire gauze or similar material, so that lamp sparks may not escape.

**Sec. 3.** All electrical apparatus must be mounted on tables of unflammable material, and must be provided with safety hoods of fireproof insulating material.

**Sec. 4.** When a limelight is used, only the so-called safety lamps, in which the gas mixture is effected just before ignition, or a mixture burner, in which the gas mixture is effected inside the burner, may be employed. With mixture burners a safety device of wire gauze or some similar contrivance must be so arranged as to prevent a back draft of the flame into the mixture chamber. There must also be metallic attachments on the saturator and on the mixture chamber, to which the safety device is fastened and to which the pipes (india-rubber hose) must be firmly attached. Oxygen may be stored only in steel cylinders or other metal containers. The use of rubber sacks is prohibited.

**Limelight, Film Drums, Nonflammable Hangings, etc.**

**Sec. 5.** When ether-benzine or gasoline limelight is used (for plants in places which can not obtain illuminating gas), the ether-benzine or gasoline fluid serving to feed the flame must be kept outside the lamp booth in a receptacle which complies with the law. This receptacle (saturator) must be connected with the oxygen cylinder by good and well-attached rubber hose. The saturator must contain porous substances to absorb the volatile ether or gasoline. The saturator may be filled only in a room separate from that in which the production of the moving picture is to take place, and only by daylight or by the light of a nonexplosive artificial light. Ether-benzine

or gasoline calcium lights may never be used in which the saturator is united with the burner or is attached to the inside of the lamp booth. The supply of ether, benzine, or gasoline must not be stored within the theater. The quantity kept within the theater may not exceed 2 kilos (4.4 pounds). It must be kept in a metal receptacle made safe against rust and the openings in which are provided with safety devices to prevent back drafts.

Sec. 6. The intense heat and light rays which pass through the lens must be shut out or weakened by safety shutters as soon as the film stops unwinding.

Sec. 7. The portion of the film which is at any moment between the light and the lens must be so isolated from the remainder of the film that, should it ignite by reason of the intense light rays passing through it, the fire will not extend to those portions of the film which have already passed by the film or are yet to pass.

Sec. 8. The film must be unrolled from a metal drum which is completely closed except for the exit opening for the film, and this opening must be so narrow that the entry of a flame is impossible.

Sec. 9. The apparatus, the lamp booth, and the lamps may not be used until they are tested under the inspection of a representative of the fire department or other competent judge, and are declared to be free from objection.

Sec. 10. The apparatus must be so set that no inflammable or flimsy stuff (paper and the like) is immediately over it. A noninflammable cover must be kept beside the apparatus, to throw over it in case of fire; also a basin of water and a fire extinguisher.

#### Other Precautions.

Sec. 11. The supply of films not actually in use must be kept in closed metal receptacles.

Sec. 12. Smoking is prohibited in the apparatus booth and in the vicinity of the films. If the apparatus booth is hung with curtains, these must be of a material not easily set on fire.

Sec. 13. The apparatus may be operated only by one who, after proving himself competent, has been licensed by the police. When electric or calcium light is used he must be well-informed as to the handling of the same.

Sec. 14. In the case of productions in theaters or halls which hold more than 500 persons, if the operation of the apparatus and the lighting of the theater are not done by the same man, a signal device must be placed beside the apparatus in order that the man in charge of the house lighting may be apprised of an existing fire or other trouble and turn on the lights in the theater.

Sec. 15. The apparatus must be so set up that the public can not come within reach of it. A safe exit must be provided for the operator of the apparatus; for the spectators there must be a sufficiently broad exit on the opposite side of the house from the apparatus.

Sec. 16. Exceptions to the above regulations may be made in cases in which other examined and approved special provisions are taken for safety. Special instructions given to owners of moving-picture shows must be observed in like manner as the contents of this order.

#### A Noninflammable Film.

So far as I have been able to ascertain, there is no truly noninflammable film manufactured in Berlin. There is, however, a film of acetycellulose whose makers [name obtainable from the Bureau of Manufactures] claim that it is waterproof like nitrocellulose films and otherwise similar to them, except that it is rather difficult of ignition and slow-burning when ignited. It is on this latter ground that the term "noninflammable" is applied to it.

(From Consul General Frank H. Mason, Paris.)

#### Safety Secured by Construction of Apparatus.

Safety from fire at cinematograph or moving-picture exhibitions in Paris is secured not by inclosing the apparatus in a fireproof booth or cell but by the construction of the apparatus itself. In the case of large cinematograph theaters, the apparatus is generally placed outside the auditorium; but the chief security is in the construction of the machine, which may be briefly described as follows:

The film is wound in a metallic cylinder called a "choker." When

in use the film passes downward in front of the lens and is automatically coiled in another metallic, fireproof "choker." Only a small section of the film—about 6 inches in length—is exposed to the rays from the lens, and should this section take fire it could not possibly ignite the portions of the film inside the "chokers" or cause a conflagration; but to avoid even this danger there is placed between the lamp and the lens a crystal vase or tank filled with water, which effectually prevents overheating the film by rays from the light.

To further secure this result a flap or movable diaphragm of metal is placed close to and in front of the film, and this is opened only when the apparatus is put in motion and closes automatically when it stops, shutting off the light from contact with the film the moment the projection is finished or suspended. This device and the existing police regulations appear to be quite effective, and there is, so far as appears, no demand that the apparatus shall be further inclosed in a fireproof booth.

[A copy, in French, of the official police ordinance which is required to be kept posted in all theaters, concert halls, and other places of public amusement, and which includes all the regulations relating to the subject now in force in Paris and the Department of the Seine, also an illustration of the machine described in the foregoing report, will be loaned by the Bureau of Manufactures.]

#### OPERA CHAIRS FOR AMUSEMENT HALLS.

[From Consul S. M. Taylor, Nottingham, England.]

There are no firms in Nottingham acting as agents for theater chairs, but for this purpose American firms might correspond with the furniture dealers whose names and addresses are obtainable from the Bureau of Manufactures. I have made inquiries as to the opportunities for such chairs, and the situation appears to be:

As soon as moving pictures began to be housed in theaters of their own, firms for the manufacture of their furnishings were established. There are now about a dozen of these, situated in London, Liverpool, Manchester, and Birmingham. When a new picture theater is decided upon, the architect or builder writes for estimates to the several firms, and naturally selects the lowest bid. Competition is very keen and prices are cut to a fine point.

An indication of British prices, which may be of value in estimating conditions of the local trade, follows: Folding birch chair, 95 cents each; garden or exhibition chair, folding iron frame, varnished lath seat and back, 54 cents each; seats or chairs to be attached to floor in rows, 15-inch centers, 12½ inches deep, solid wood stained any color, polished backs 5½ inches, painted iron standards, 95 cents each; same, with seat and back with upholstered center, finished banding and brass studs, covered American leather cloth, \$1.21 each; seats or chairs to be attached to floor in rows, 16 to 18 inch centers, 5-inch stuff-over back, seat 14 inches deep, well upholstered, 3 to 5 inches thick, covered in good quality Utrecht velvet or railway rep, \$1.82 each.

The best method of reaching the local trade is to deal through a wholesale distributing agency in London, Liverpool, or Manchester, which would act as a center for the British trade generally. I am

very doubtful whether it would be found profitable to establish an agency in this city, as the amount of business to be done here in the future is likely to be limited, the community being already well supplied and almost oversupplied with moving-picture shows.

[From Consul General John L. Griffiths, London, England.]

#### **British Prices Low.**

Prices of British-made theater chairs are very low, and when the seating of a hall is installed under contract prices in the aggregate rule slightly lower. It is thought that the public generally prefers upholstered or leather (usually imitation) covered chairs, and that steel chairs would not be popular. So far as cinematograph theaters and ordinary theaters and halls are concerned, it would appear that the present local demand is fully supplied; in fact, in many districts they are already so numerous that the margin of profit is frequently at a minimum, and, being already fitted, the introduction of new chairs in place of those already in use would not commend itself to the owners.

[From Consul Robert Fraser, Jr., Valencia, Spain.]

#### **Valencia a Furniture-Manufacturing Center.**

Present prospects for the Spanish importation of opera chairs and general seating supplies for theaters and other places of amusement are not encouraging so far as the Valencia district is concerned.

With the sole exception of trial samples of office furniture and barbers' chairs, no furniture of any kind has been imported here during the past 8 years. Valencia is one of the most important centers of Spain for the manufacture of chairs and miscellaneous furniture; and although the greater part of the lumber used by furniture factories is imported, the employment of modern machinery and abundance of labor at a low wage scale contribute to cheapen the cost of production, while the very high tariff on imported furniture effectively excludes foreign competition.

Plain wooden chairs without moldings or ornamentation pay a duty of \$13.51 per 100 kilos (220.46 pounds), which is equivalent to an ad valorem duty of about 40 per cent, as the value on which the tariff schedule was based was \$33.80 per 100 kilos. Chairs the wood of which is turned or with moldings attached pay \$28.95 per 100 kilos, and chairs upholstered with leather, silk, or silk mixtures pay duty at the rate of \$33.80 per 100 kilos, the estimated cost of production on which this last-named tariff was framed being \$96.50 per 100 kilos.

#### **American Styles Copied.**

The few sample chairs and pieces of office furniture imported from America serve only as models for imitation, and an important factory recently established at Barcelona is turning out exclusively American designs, which are reproduced with marked fidelity in form and appearance.

The chairs most in demand here are of plain wood, seated with stamped veneers, or rushes and sedges grown on the borders of the marshes and rice fields near this city, and cost only 50 cents per chair complete. These chairs are piled in thousands during the long summer in the public parks, open-air theaters, churches, etc.,

and are hired at the rate of 1 to 5 cents per hour or performance, according to the importance of the festivity or celebration.

There are no importing merchants or jobbers in foreign furniture in Valencia, and all firms engaged in the furniture trade appear to take it for granted that there is no possibility of competing with home products at present.

[From Consul General Thomas Sammons, Yokohama, Japan.]

#### **Japan Supplies its Own Needs.**

The ruling factor in the sale of chairs for amusement halls in Japan is cheapness; and although quality and durability are desirable features, the cost of the homemade article is so low and so adapted to the present needs of the people that little encouragement can be held out as yet for the sale of Western equipment. Of the four classes into which the seats of amusement halls in Japan are divided, only two, the "special" first and the first class are provided with chairs, the greater majority of seats included in the third and second classes being merely rude wooden benches.

---

Lists of moving-picture theaters or other pertinent names that accompanied the foregoing and other consular reports may be had upon application to the Bureau of Manufactures. Among earlier articles on the foreign cinematograph trade that have been published in Daily Consular and Trade Reports were those appearing in the issues for Aug. 5 and Oct. 12, 1910; Jan. 14, Apr. 28, May 29, Aug. 22, and Oct. 7 and 14, 1911; and Jan. 13, 1912.

---

#### **WIRELESS TELEGRAPHY AT CONSTANTINOPLE.**

[From Ambassador W. W. Rockhill.]

The Imperial Ottoman Government has communicated the following note, dated April 21, concerning the prohibition of the use of wireless telegraphy on all vessels at Constantinople:

In conformity with the principle admitted in the last international telegraph conference at Lisbon and in view of the present extraordinary circumstances, the Imperial Government has decided to forbid to vessels found at the port of Constantinople the use of wireless telegraphy. Besides, such private correspondence causes to the working of the State apparatus some perturbation which at the present time may have serious consequences.

In bringing this decision to the notice of the embassy of the United States of America, the Ministry for Foreign Affairs would be much obliged if the embassy would be good enough to immediately communicate it to the captains of its national vessels and see that it is scrupulously complied with.

---

#### **Central Oil Depot Proposed in Philippines.**

Manila papers state that the Standard Oil Co. has renewed its application to the insular government for an allotment of space on the Malecon-Luneta fill, and if it receives favorable consideration will erect a large pier and a storage plant. The plans of the company call for a large modern pier capable of accommodating the largest steamers, the cost of which is estimated at \$400,000. The shore plant will provide for the concentration of all the business of the company in Manila. These structures will cost in the neighborhood of \$3,500,000.

**SAN FRANCISCO-AUSTRALIAN MAIL LINE.**

[From Consul Mason Mitchell, Apia, Samoa, confirming announcement from Sydney, Australia, in Daily Consular and Trade Reports for June 3.]

The Oceanic line of steamers is to resume its sailings on July 2, running monthly from San Francisco to Sydney via Honolulu and Pago Pago.

It is further reported to be the intention of the company to put on two ships at first, which, by their contracts, will have to make the trip from San Francisco to Pago Pago in 13 days and from San Francisco to Sydney in 20 days. These ships have recently been supplied with oil burners and will have to be tried before it will be possible to tell whether they can make the trip in time to enable them to call at Apia.

It is thought that the calling of this line of steamers at Apia would mean an increase in American trade, besides being of great value on account of the tourist traffic. It is estimated that each ship would land at least 250 tons of cargo from San Francisco.

The harbor of Apia has been free from heavy storms since 1889 and the island is believed to be outside the hurricane zone. There are 75 miles of good roads in Apia and plenty of vehicles, and beautiful and picturesque waterfalls and picnic grounds are near by.

---

**AUSTRALIAN WHEAT HARVEST.**

[Statement of the High Commissioner for the Commonwealth of Australia in London.]

Complete returns of the Australian wheat harvest of 1911-12 have not yet been issued, but on the figures so far available it is estimated that the exportable surplus of the Commonwealth will exceed 44,000,000 bushels. The surplus of each State is set down as follows: New South Wales, 13,616,000 bushels; Victoria, 11,891,000 bushels; South Australia, 16,500,000 bushels; Western Australia, 2,000,000 bushels. These figures are approximate, and it is considered not unlikely that when the complete returns of the harvest come in it will be found that the total will be somewhat larger. The total production of the Commonwealth for 1911-12 was 72,550,000 bushels, a decrease of 22,560,000 on the previous year's harvest, which was a record one. New Zealand's harvest this year is 6,480,000 bushels (a falling off as compared with last year of 1,800,000), which makes the total for Australasia just over 79,000,000 bushels. The Australasian total last year was 103,380,000 bushels.

---

**The Pan American Railway in Guatemala.**

Of the 33 miles necessary to complete the Pan-American Railroad gap in Guatemala, the construction of which was inaugurated on November 21, 1910, Consul General Bucklin states that 7 miles have now been completed and trains are being run, these 7 miles being from Las Cruces on the Central Railroad to San Miguelito, giving thus access to additional rich coffee-producing estates. It is not contemplated that the remaining 26 miles will be completed before two years more, labor being scarce.

---

**Conferences on Venezuelan Business.**

Mr. Jefferson Caffery, secretary of the American Legation at Caracas, was due to arrive in New York June 13 on the Red D Line. He expects to be at the Hotel Astor for a time, and may be seen by those interested in Venezuelan business affairs.

## CANAL TRAFFIC OF THE GREAT LAKES REGION.

## CANADA.

[From Montreal Gazette; see also Daily Consular and Trade Reports for May 10, 1911.]

Canadian canals are divided into several sections, the most important of which are those of the St. Lawrence system between Montreal and Fort William. The others serve local rather than general business, and in the cases of the Chambly, the St. Peters, the Murray, and the Ottawa River waterways there was considerably less business done in 1911 than in 1910. As regards the Chambly and the Ottawa system this decrease may have been as much the result of the competition of the railways as of any decline in trade.

Taking the whole of the canals, there was moved through them in the season of 1911 a total of 38,030,000 tons of merchandise. This compares with 42,990,000 tons in 1910, the decline being due to a falling off at Sault Ste. Marie, chiefly because of slowness in the United States ore trade. The traffic of 1911, however, was double that of 1908 and four times that of 1905.

[For the distribution of this freight tonnage among the different canals of the Dominion see Daily Consular and Trade Reports for June 7, 1912, page 982.]

## Wheat Shipments through the Soo.

By mutual understanding the canals on either side of the St. Marys River are open to the vessels of Canada and the United States on equal terms. As a result there passes through the Canadian lock much of the domestic traffic of the United States. The Sault canal is, however, of decided benefit to Canadian business. There passed through it last year 63,641,000 bushels of Canadian wheat, and this was 12,000,000 bushels more than in 1910 and 15,600,000 bushels more than in 1909. There also passed through the United States canal at the Sault 1,981,000 bushels of Canadian wheat, making the total going from Lake Superior to Lake Huron 65,622,000 bushels. If to this is added the equivalent in grain of 183,000 barrels of Canadian flour passing through the Canadian and 841,000 barrels passing through the United States canal, the total wheat shipments would be 69,723,000 bushels.

The destination of the wheat is thus given, in bushels: From Fort William—to Montreal 12,761,000, Georgian Bay ports 9,881,000, other Canadian ports 11,880,000, Buffalo 27,945,000; from Duluth—to Buffalo 710,000, Georgian Bay 461,000. In this regard the record of 1911 was a little more favorable to Buffalo and a little less favorable to Canadian ports than that of 1910 or 1909.

## UNITED STATES.

American official statistics of the commerce of the canals at Sault Ste. Marie, Mich., and Ontario, Canada, during the seasons (nine months) ending December 31, 1909, 1910, and 1911, give the following figures in short tons:

Freight.	9 months ending December, 1909.		9 months ending December, 1910.		9 months ending December, 1911.	
	United States canal.	Canadian canal.	United States canal.	Canadian canal.	United States canal.	Canadian canal.
	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>
Eastbound.....	22,028,768	24,350,318	15,602,673	31,531,036	10,442,296	25,867,104
Westbound.....	8,103,606	3,412,457	10,324,988	4,904,521	12,081,052	4,966,785
Total.....	30,132,374	27,762,775	25,927,661	36,435,557	22,523,347	30,833,889

This freight had an estimated value in 1909 of \$626,104,173 and in 1910 of \$654,010,844. Values for the calendar year 1911 are not yet available. Through freight westward by passenger vessel consists principally of what is known as "package freight" or general merchandise for distribution at and through upper Lake ports. Westbound cargo consists chiefly of coal, this commodity comprising 90 per cent

of the total westward traffic in 1911. Eastward freight includes iron ore as the principal item; also flour, grain, and lumber. Passenger traffic is about equally divided in both directions; it amounted to 79,951 persons in 1911, 66,933 persons in 1910, and 59,948 persons in 1909.

The traffic through the Portage Lake ship canals for the last three seasons was as follows: Cargo—1909, 2,592,168 short tons, estimated value \$85,400,667; 1910—2,453,836 tons, value \$77,455,763; 1911—2,200,402 tons, value \$79,012,209. Passengers—1909, 52,131; 1910, 65,334; 1911, 66,526.

---

### FEMININE VOTERS IN DENMARK.

[From Consul General E. D. Winslow, Copenhagen.]

Women residents of Copenhagen have the franchise in municipal affairs. It is interesting to note what percentage of the voting population exercised the privilege at the last election for the board of aldermen. It was shown that 70,326 men and 67,473 women had the right to vote, and of this number 56,795 men and 46,347 women went to the polls. This vote indicates that 80.8 per cent of the men and 68.7 per cent of the women electors used the ballot at the spring election. The votes cast of both sexes represents 74.8 per cent of the total registration. The percentage in 1909 was 75.2 per cent.

---

### British Steel Prices Advanced.

Scottish steel makers announce a further advance in the price of angles and ship and boiler plates of 5s. (\$1.217) per ton, making the prices for these \$36.45, \$38.30, and \$42, respectively, all less 5 per cent for Clyde delivery or equal. This places their prices on the same level as those of the northeast of England producers. This is the fourth advance of 5s. per ton intimated since the rebate scheme came into operation in October last.

---

### Final Indian Crop Forecast.

The final Government forecast of the Indian crops for the season 1911-12 indicates a total yield of wheat of 9,812,500 tons compared with a yield of 9,921,300 tons in 1910-11. The total yield of linseed is estimated at 640,500 tons against 557,800 tons in 1910-11, and the total yield of rapeseed is placed at 1,270,500 tons against 1,250,300 tons in the preceding season.

---

### Olive-crop Prospects in Syria.

Consul General W. Stanley Hollis, of Beirut, reports, under date of May 10, that experts predict a very small olive crop in that part of Syria, principally because of the heavy production last year and the continual changes in the weather during the past four months.

---

*The Hoangho bridge*, which the Tientsin-Pukow Railway is building at a cost of \$2,500,000, is to be opened with elaborate ceremonies next October. It is the finest of its kind in China.

## FOREIGN TRADE OPPORTUNITIES.

[Inquiries in which addresses are omitted are on file at Bureau of Manufactures. In applying for addresses refer to file number.]

*Consuls are requested to contribute to this department, and in doing so should in each instance state in what language correspondence should be conducted.*

- No. 9018. Guayule and raw rubber.**—An American consul in a European country reports that a resident of his district would like to communicate with persons in the United States controlling guayule and raw-rubber interests in Mexico or Central America. He desires connections for his trade with European rubber industries, and estimates that he could dispose of about \$1,000,000 worth of this product to the local trade.
- No. 9019. Crocidolite.**—A request has been received at an American consulate in South Africa from a business firm for the names of American manufacturers of jewelry and other articles who would be interested in the importation of raw crocidolite, to be made into ornaments of various kinds, for which there is a good market in the United States. Copy of the complete report, giving particulars regarding the prices of the materials as well as samples of the finished and raw products, will be sent to interested firms by the Bureau of Manufactures.
- No. 9020. Agency for American goods.**—A new agency for American goods is being opened in a Central American city. An American consular officer reports that the head of this firm is an American business man who has had many years of successful experience in railroad and other lines. He is now extending his business by opening an agency, and wishes to get into touch with important lines of goods for which there is a market in Central America. He is said to bear an excellent reputation for business reliability. Bank references are furnished.
- No. 9021. Hydro-aeroplanes.**—It is stated that a foreign Government will make some extensive purchases of aeroplanes and hydro-aeroplanes in the near future. The plans contemplate the purchase of 30 of these machines, as a beginning, and it appears that American makes would probably be preferred on the basis of merit. Emphasis is laid upon carrying power. An American consul writes that an appropriation of \$515,000 was made recently for these purchases, and within a short time 100 aeroplanes have been ordered for the army from three different companies. A valuable contract with an American firm is liable to be forfeited because of the company's delay in delivering the goods.
- No. 9022. Rubber and other African products.**—The Bureau of Manufactures is in receipt of a communication from a business man in Africa stating that he would like to get in touch with American firms purchasing supplies of rubber. He has forwarded samples of the material, which can be obtained by addressing the Bureau of Manufactures. He states that in addition to crude and refined rubber he ships regularly ebony wood, wax, etc., in which lines he is also open for connections. Bank references are furnished.
- No. 9023. Subsoil plows.**—An American consul in the West Indies reports that a company which grows bananas extensively for export wishes to correspond with American manufacturers of subsoil plows that will break the soil to a depth of 18 to 20 inches. Catalogues in English, export prices, and full details should be sent at once.
- No. 9024. Breakwater and wharf.**—The American consul general at Ottawa reports that the Department of Public Works, Ottawa, Canada, has advertised for bids, to be received until June 27, for the construction of a breakwater wharf at Carrs Brook, Colchester County, Nova Scotia; also for tenders, to be received until July 2, for the construction of a pile-bent wharf at Boswell, division of Nelson, Kootenay district, British Columbia. Plans, specifications, and form of contract can be seen and forms of tender obtained at the Department of Public Works, Ottawa.
- No. 9025. Boston white rum.**—A European export agent informs an American consular officer that he is in the market for large quantities of Boston white rum, in barrels of 120 gallons each, price to be about 23 cents per gallon, 100 per cent. He is desirous of quick action, as he has several large contracts on hand which must be closed at an early date.
- No. 9026. Gasoline motors, oils, and automobile accessories.**—A firm in a Mediterranean country desires to communicate with American manufacturers of gasoline motors, heavy oil, transmission belts, lubricating oils, and accessories for automobiles. An American consul reports that the firm has well-equipped show-rooms and supplies first-class references.

## COMMERCIAL CONDITIONS IN PANAMA.

[By Consul General Alban G. Snyder, Panama City.]

There was no marked change in conditions in Panama during 1911, and there are no particular circumstances that would seem to indicate any striking increase in prosperity in the near future. As the canal nears completion the gradual discharge and departure of hundreds of employees is certain to affect conditions, and the loss of the harvest of money after each canal pay day is sure to be felt for some time.

Aside from this the effect on this country of the completion of the canal is as yet a rather uncertain matter. Some people consider as a certain result the coming of great prosperity to the country as a whole and the growth of this city to a thriving metropolis of 100,000 population in a few years. Others admit a considerable benefit to the country, but assert that the greater part of the local prosperity will go to Balboa, the Pacific terminus, and predict the gradual decline of Panama City. Some few who hold the former opinion are investing in buildings in this city and construction has shown more activity in the last few months than for many years.

### Land Investments—Public Works.

Americans have lately shown an increased interest in the land situation in Panama, and the Government is making efforts to encourage agriculture, but investors would do well to be careful and go slow in such matters. While this country, like the rest of Latin America, may offer a good opportunity for capital in the development of its immense resources, it is not a suitable place for the investment of the capital of Americans of moderate means. During the last part of 1911 conditions here were somewhat unsettled, but on the whole business slightly increased during the year, especially American trade.

The public works provided for in laws passed early in 1911 have been pushed forward, and the Secretary of the Department of Public Works is planning further improvements. Road-building machinery of the latest model has been secured, and road building, which under old methods cost about \$7.20 per linear meter for a 16-foot road, has been reduced to \$4.40, and the secretary, who is himself an engineer,

hopes eventually to reduce the cost below \$4. He has planned interior developments for some time to come and has built up a good body of assistants. He shows an active interest in the work, and it is stated that the economy effected is considerable.

A rock crusher and equipment are to be forwarded soon for the work on a proposed important road 13 miles long from Mensabe to Las Tablas, and it is said that the secretary intends to recommend the building of a telephone line between those points. Work is also to be started shortly on a road between Puerto Posado and Penonome, and work on the Juan Diaz road is progressing satisfactorily. The port of Chitre has been opened up, greatly facilitating shipping at that place. A canal 150 meters long and 50 meters wide was dug through a neck of land caused by a bend in the river at that point, which has made the port accessible without the old delays caused by waiting on available tides. This canal has shortened by about 2 miles the distance between the anchorage and the bar, and a wharf is to be built later at this port.

#### Public Improvements.

The water service in the city of Panama was unsatisfactory in 1911, but the Zone officials say that the recent replacing of the old main by a larger one will remedy the trouble. Other items of public improvement during 1911 were the completion of the imposing National Institute in this city, provision for a new municipal slaughterhouse, the completion by the Canal Zone Government of what is to be the trans-Isthmian road as far as Gorgona, or a distance of 22 miles, the completion of a road from the Sabanas Road to old Panama, and the clearing and opening up of the old city destroyed centuries ago by Morgan, with all its interesting and possibly valuable revelations. The street railway company has opened offices in this city, and it seems now the long-talked-of street car line would be an accomplished fact. [The name of the general manager of this project can be obtained from the Bureau of Manufactures.]

#### Import Trade of the Year.

The following table of imports into Panama in 1911 shows the share of the principal countries in the larger classifications of the trade:

Imports.	United States.	United Kingdom.	Germany.	France.	Other countries.	Total.
Animal products.....	\$1,098,981	\$311,005	\$121,596	\$22,226	\$111,062	\$1,664,870
Vegetable products.....	1,465,724	460,649	403,649	32,792	430,108	2,792,911
Mineral products.....	568,546	134,744	111,030	10,114	94,537	908,971
Textiles.....	578,074	803,621	90,119	13,558	144,030	1,630,002
Chemical and pharmaceutical products.....	191,100	90,426	117,286	25,979	13,273	438,064
Liquors, distilled and fermented.....	281,011	114,008	52,406	102,862	104,518	744,955
Paper, and manufactures.....	61,128	9,771	33,957	1,520	5,948	112,322
Machinery.....	257,516	24,666	50,827	11,728	3,719	348,956
Vehicles.....	33,351	4,034	51	1,225	2,269	40,930
Arms and explosives.....	20,290	6,118	3,849	.....	8,335	44,592
Other articles.....	541,914	308,270	131,304	85,084	77,309	1,143,881
<b>Total.....</b>	<b>5,104,233</b>	<b>2,267,401</b>	<b>1,116,134</b>	<b>391,578</b>	<b>986,108</b>	<b>9,865,454</b>

Some of the more important items in detail and the countries sending the principal amounts were as follows: Automobiles and accessories: United States, \$6,300. Beer: Germany, \$24,000; United States, \$159,000; England, \$39,600; Belgium, \$9,800. Blacksmith

materials: United States, \$20,500. Codfish: United States, \$47,000; England, \$8,000. Cigarettes: United States, \$34,000; England, \$24,000; Latin-American countries, \$48,000. Electrical materials: United States, \$52,000; England, \$2,000; Germany, \$1,200. Flour: United States, \$357,000. Furniture: United States, \$88,000; Germany, \$11,000; England, \$7,500. Gasoline: United States, \$26,000. Photographic material: United States, \$24,000. Paints: United States, \$36,000; England, \$31,000. Petroleum: United States, \$84,000. Red wine: United States, \$47,000; Spain, \$19,000; France, \$15,000. Ready-made clothing: United States, \$283,000; England, \$82,000; Germany, \$32,000; Spain, \$21,000. Rice: United States, \$23,000; Belgium, \$12,000; Germany, \$307,000; China, \$10,000. Shoes: United States, \$452,000; China, \$10,000. Soap: United States, \$95,000; England, \$58,000. Sugar: United States, \$78,000; Germany, \$48,000; England, \$38,000. Tea: China, \$2,600; England, \$29,000. Cotton thread: England, \$36,000; United States, \$3,400. Leaf tobacco: United States, \$24,000. Manufactured tobacco: England, \$79,000; Latin-American countries, \$16,000; Belgium, \$9,000; United States, \$4,500. Wire fence: United States, \$33,000.

#### Export Trade—Declared Exports to United States.

The exports amounted to \$2,853,725, the countries to which they went being as follows: United States, \$2,566,115; Germany, \$157,302; England, \$125,170; France, \$4,683; and Italy, \$455. Exports to the United States declared through this consulate were as follows in 1910 and 1911:

Articles.	1910	1911	Articles.	1910	1911
Cocobola.....	\$40,466	\$37,847	Ipecac.....		\$13,739
Deerskins.....	7,956	15,100	Mahogany.....	\$1,519	7,392
Gold bullion.....		1,252	Rubber.....	201,686	30,379
Hides:			Shell.....		6,500
Dry.....	33,205	28,320	Tuna gum.....		2,309
Wet.....	64,000	62,022	All other articles.....	9,399	3,367
Household effects.....	1,469	1,084			
Ivory nuts.....	60,265	56,060	Total.....	420,034	265,431

Returned American goods, consisting of machinery, typewriters, jewelry, cinematograph films, etc., amounted to \$7,904 in 1910 and \$9,865 in 1911. There were no invoices certified to Porto Rico, Hawaii, or the Philippines.

#### National Finance.

The national revenue for 1911 amounted to \$3,695,888 and actual expenses to \$3,686,326. In addition, the Republic has \$6,000,000 invested in first-class mortgages in New York, besides the money on deposit to guarantee the fractional silver currency. On the inauguration of the present administration on October 5, 1910, debts were pending against the national treasury amounting to \$600,000, on account of which the executive authority contracted a loan of \$250,000 from local banks to meet punctually the public obligations and carry out urgent public improvements. The increase of import duties from 10 to 15 per cent ad valorem increased the treasury receipts to such an extent that a part of this loan could be paid, and only \$104,000 is now due on it. The previous public debt was also reduced about \$265,000. The national credit is therefore better than for some time past. The present debt of about \$334,000 has not been

met owing to the expense involved in the construction of the National Institute, but its payment by monthly installments has been provided for through an agreement with local capitalists.

**Population by Provinces—Deaths, Immigration, etc.**

According to a census completed in 1911, the population of the Republic, by Provinces, was as follows:

Provinces.	Other than Indians.	Indians (estimated).	Provinces.	Other than Indians.	Indians (estimated)
Bocas del Toro.....	22,732	.....	Panama.....	67,724	3,123
Cocle.....	35,011	.....	Veraguas.....	51,344	8,270
Colon.....	24,837	7,255	Total.....	300,504	36,178
Chiriqui.....	46,834	17,530			
Los Santos.....	53,082	.....			

Of the total number, 46,323 are whites and the rest mixed, negroes, etc. According to the Canal Zone census of 1908 the population, under the jurisdiction of the zone authorities in Colon and Panama, was 50,003, making a grand total for the Panama Republic of 386,745. The estimated population of the whole Canal Zone, according to the sanitary department, was 90,186 in 1908. A new census of the Canal Zone is now being taken.

According to the report of the chief sanitary officer, Isthmian Canal Commission, the total number of deaths in Panama and Colon during 1911 was 1,456 and 527, respectively. In the quarantine service the number of men inspected at Panama and Colon in the crews of vessels was 103,520 and the number of passengers inspected 62,296. Cabin passengers landed from foreign ports in 1911 numbered 19,606, while 19,544 embarked for foreign ports. Arrivals of steerage passengers numbered 21,520 and departures 17,272.

**Telegraph Changes—Parcel Post and Credit Terms.**

There were few changes or additions to the telegraph lines in 1911, all energy being directed toward the improvement of existing lines, most of which have been overhauled and put in good condition. The old No. 9 galvanized-iron wire is fast being replaced by No. 10 copper wire, and 600 iron poles have been substituted for the old wooden poles. A bank of 60 storage cells with mercury arc rectifying outfit has been substituted for the old gravity battery of 250 cells in the main office at Panama and is showing its efficiency in better and superior work and greater economy. The tower and instruments for a wireless station in Panama were ordered last December, but work was stopped until further notice at the request of the American Government.

The fees charged for the certification of invoices of merchandise sent from the United States were reduced from \$3 to \$1.

Features which may affect trade to some extent are the absence of a parcel post, making it necessary for people to rely on the express companies for the shipment of small packages, and the limited credit terms as compared with other Latin-American countries. Usual terms are from 30 to 60 days, and on rare occasions these are extended to 120 or 180 days. Before giving credit firms usually apply to banks for information, which is given freely without responsibility on the part of the bank. Little credit is given direct to importers by manufacturers, the latter as a rule getting orders from commission houses.

**Industries of Panama—Encouragement of Agriculture.**

The cattle and tobacco industries of Panama remain about as in recent years. The banana industry of the United Fruit Co. in the Bocas del Toro district continues to flourish and grow. Several American and other foreign companies are pushing the development of the lumber and rubber resources of their various properties and several shipments of lumber have been made in preparation for more active development in the near future if all goes well. The future of the coconut industry seems bright, and, while the Atlantic coast is probably best at present for this industry, several parties on both coasts are planting large areas. Most of the shipments are now sent by the San Blas Indians.

Good sugar cane is grown in some parts of Panama and the Government seems inclined to aid this industry. The known part of the country is rich in ivory nuts, rubber, hardwoods, and all tropical and some temperate products, and some believe that the unknown regions of the Darien to the south are richer still in agricultural and mineral wealth. The drawbacks to the proper agricultural development are many and the imperative need for agricultural improvement and the opening up of inland communication is recognized. Land titles are badly mixed and extreme care must be exercised by investors in real estate. The Government is encouraging colonization, and one American has entered into a contract to establish a colony of at least 100 families in the next seven years on a tract of 12,500 hectares (30,888 acres), an equal area to be granted to the promoter of the project at the end of seven years or sooner if the 100 families are settled.

**Mining—New Laws, Automobiles, etc.—Shipping Record.**

Little advance was made in mining in 1911, the only mine in active operation being the Darien Gold Mining Co. Altogether 169 mines, including gold, silver, copper, sulphur, asbestos, iron, and lime mines, have been denounced in the Republic.

Laws were passed in 1911 establishing a school of telegraphy, prohibiting gambling, and regulating automobile traffic. There are about 50 automobiles in this city, all of American make. A tax of \$4 a month is levied on those used for pleasure and of \$7.50 on those used for commercial purposes. The field is limited both by the low purchasing capacity of the people and by lack of roads suitable for motoring.

Both the Panama-Darien Railway project and the Dziuk concession in the south came to an end in 1911, the former through the President's veto and the latter through the Government's declaring the concession forfeited because of failure to comply with terms. There is a small railroad at Bocas del Toro owned and operated by the United Fruit Co., but the only road of any importance in the country is the Panama Railroad.

No ocean-going vessels entered or cleared at the port of Panama proper in 1911, the whole trade being made up of the small steamers of the National Navigation Co. and of sailing vessels. The Pacific coast shipping calling at Panama included the following: Eight small steamers of 859 tons, 24 gasoline launches of 77 tons, 43 schooners of 1,161 tons, 35 sloops of 198 tons, and about 610 boats of various grades from fruit boats to dugouts. During the year the United Fruit Co. further improved its service to Colon and contemplates

shortly increasing its service to New Orleans. It is also said that the Pacific Steam Navigation Co., now incorporated with the Royal Mail, intends shortly to extend its Liverpool-Callao mail service to Panama and in view of the near completion of the canal make Balboa its Pacific terminus.

### COLON.

(From Consul James C. Kellogg.)

The principal articles entering into the import trade of Colon and the principal countries from which they came in 1911 were as follows:

Articles.	United States.	United Kingdom.	Germany.	France.	Spain.
Beer.....	\$86,152	\$23,157	\$11,774		
Dry goods, boots, shoes, etc.....	\$91,998	\$62,396	\$102,678	\$18,962	\$25,370
Drugs.....	28,533	11,802	4,401	1,224	
Furniture.....	50,759	4,227	5,715	960	
Hardware.....	85,188	26,283	12,103		
Kerosene.....	16,918				
Liquors.....	42,538	12,947	13,390	67,430	37,447
Lumber.....	115,406				
Provisions.....	\$71,211	77,296	118,459	4,793	3,044
Tobacco and cigars.....	59,891	5,708	4,006		140
Other articles.....	81,245	33,736	7,066	3,639	
<b>Total.....</b>	<b>1,678,069</b>	<b>559,352</b>	<b>280,221</b>	<b>96,978</b>	<b>66,001</b>

### Declared Exports to United States.

The value of the declared exports to the United States from Colon and Bocas del Toro in 1911, exclusive of returned American goods which amounted to \$13,826 at the former place and \$23,272 at the latter, was as follows:

Articles.	Value.	Articles.	Value.
<b>COLON.</b>		<b>BOCAS DEL TORO.</b>	
Balata.....	\$5,876	Bananas.....	\$2,146,396
Coconuts.....	62,049	Chocolate.....	31
Hides.....	8,319	Coconuts.....	12,081
Horns.....	42	Household effects.....	165
Hats.....	481	Orchids.....	272
Ivory nuts.....	56,985	Rubber.....	338
Rubber.....	524	Turtles, live green.....	2,096
Turtle shell.....	3,830	Turtle skin.....	142
Other articles.....	117	Turtle shell.....	911
<b>Total.....</b>	<b>138,223</b>	Wood, red mangrove.....	47
		<b>Total.....</b>	<b>2,162,461</b>

The principal declared exports from Colon in 1910 were: Coconuts, \$89,004; hides, \$11,606; ivory nuts, \$57,075; and turtle shell, \$28,597. The total value was \$210,054.

### Shipping Record—Business of Colon Declining.

The number of ships entering the port of Colon in 1911 was 579, of 1,775,226 tons, as compared with 406 of 1,141,100 tons in 1910. The arrivals by nationality were as follows: American, 10 vessels of 27,885 tons; British, 285 vessels of 813,378 tons; German, 161 vessels of 436,572 tons; Norwegian, 76 vessels of 168,036 tons; French, 24 vessels of 61,680 tons; Spanish, 12 vessels of 37,084 tons; and Italian, 11 vessels of 447 tons.

The neighboring port of Cristobal, Canal Zone, continues to receive nearly all the cargo steamers arriving with merchandise for

the Isthmian Canal Commission, as well as the steamers of the Panama Railroad Co., which formerly entered at this port. This has decreased materially the number of vessels and the tonnage arriving at Colon. Vessels entering at the Colon customhouse, discharging cargo, and then leaving for Cristobal have to clear in the same manner as if going to a foreign port.

Of the 313 vessels entering and leaving the port of Balboa last, 123 were American.

Although the value of the imports at Colon showed an increase over 1910 because of the heavy purchases before the tariff increase went into effect, business in Colon is getting worse and worse. During 1911, 11 firms went out of business, and there are others remaining only because they can not dispose of their stock, and still others hanging on in the hope that things will improve. The Colon Board of Commerce in December, 1911, delegated its secretary to appear before the Committee on Interstate and Foreign Commerce of the United States House of Representatives, in session at Ancon, to discuss some matters of interest to the business men of the Isthmus, especially Colon. Among other things the secretary called attention to the different kinds of mercantile enterprises engaged in by the United States Government on the Isthmus.

---

### FIRE AND LIFE INSURANCE IN CANADA.

[From Consular Agent Sydney F. Culver, Fredericton, New Brunswick.]

The fire losses paid out by the various insurance companies in 1911 totaled \$10,937,159, an increase of \$644,766 as compared with 1910, according to the annual report of the insurance branch of the Dominion Finance Department.

The net cash received in premiums was \$20,572,182, a gain of nearly \$2,000,000, and the gross amount of risk at the end of the year was \$2,277,968,950, an increase of a little over \$243,000,000. British companies are apparently capturing most of the new business. During the year they increased their total amount of risks by \$177,000,000 as compared with an increase of \$46,000,000 by the Canadian companies and \$71,000,000 by the American companies. The total fire loss last year was the largest since 1904, when the companies paid out a total of \$14,099,534.

Life insurance business showed a rapid growth during the year. The premiums totaled \$31,619,626, an increase of \$1,847,723 over 1910, while the amount paid out in claims aggregated \$11,043,274, an advance of only \$146,804. The total amount of life insurance in force at the end of 1911 was \$950,413,633 on 1,335,047 policies. The increase in the amount in force during the year was \$94,300,274, the new policies numbering 162,922.

---

### Cement Shortage in Alberta Province.

The Canadian press prints a dispatch from Edmonton, stating: "Citizens of this city claim they are suffering a loss of \$5,000 per day due to cement shortage."

---

*A mail tube line, 7½ feet in diameter, is to be constructed in London by the British Post Office. Each vehicle will be operated by an individual electric motor.*

**INCREASING USE OF ANILINE DYES IN RUG MAKING.**

(From Consul W. W. Masterson, Harput, Turkey.)

Within the past few years vegetable dyes, generally of local manufacture, have been superseded to a great extent by the introduction into Turkey of coal-tar and aniline preparations.

In the old days the art of preparing vegetable dyes and of dyeing was followed by many people of this country, the secrets of the trade being handed down for generations. Those engaged in this trade occupied an enviable position in the villages and lived far better than the mechanics and tradespeople of the place. In those times every rug-weaving establishment had a dyer permanently employed whose only work was the preparation of vegetable dyes and the dyeing of the different colored wools. Indigo then formed a considerable item of import from India, for this color was the base of many of the different shades of blues, and nearly every shop-keeper in the market kept, as staples, some of the commoner vegetable coloring preparations.

Within the last few years there has been an almost complete transformation and a substitution of coal-tar and aniline preparations for these vegetable dyes. Most kelims and the cheaper rugs of all kinds now found in the markets show that their colors are not obtained by the old methods. The extent of this substitution is made clear by the import statistics of Harput. In 1906 there was no mention of the importation of aniline preparations in the annual trade returns, while for the year 1911 those preparations, under the heads of alizarin and aniline, were imported into this city to the value of \$18,500 and receipts of indigo shrunk to the insignificant figure of \$1,800.

**Detection Easy—Aniline Dyes Cheaper.**

Fortunately, however, these aniline dyes can be detected in rugs with comparative ease. The colors are always bright and very pronounced and generally, on the application of a little moisture on a rag, will rub off; or by placing a rug in the sunlight for a few days the colors will fade quite decidedly. On the contrary, vegetable coloring is generally not so pronounced in tone, will not fade either in washing or in the sunlight, and will grow softer, richer, and glossier with the passing years.

The principal and about the only reason for this substitution is the cheapness of the aniline colorings in comparison with the time and labor spent in procuring the vegetable dyes. Hunting for some of the roots and herbs, boiling, and blending, all take time and labor and add to the expense of the vegetable dyes. Again, with the continued growth of the weaving industry throughout the country the need for dyes became so great that the production of the vegetable dyes in the slow expensive methods was not sufficient, and to meet this demand the introduction of aniline coloring matter was brought about. Aniline dyes are imported exclusively from Germany, and the trade has now grown to such importance that a traveling agent makes an annual tour throughout the interior of Turkey.

[The use of vegetable dyes in rug making is noted in the following articles which were published in Daily Consular and Trade Reports

on the dates indicated: Rug making in India, by Consul General William H. Michael, Calcutta, July 23, 1908; Rugs from the Orient, Consul Frederick Simpich, Bagdad, May 28, 1910; Vegetable dyes best for oriental rugs, Consul General Michael, Nov. 18, 1910.]

### LONDON STREET NAME PLATES.

[From the London Times.]

The present great diversity of the street name plates in London was discussed at a conference just held at the Royal Institute of British Architects. Members of borough councils in nearly every part of London attended, and there was a free interchange of views with the architects present. It was generally agreed that some uniformity of treatment is desirable. Some of the London street name plates are cast iron, many are enameled iron, others are of zinc or tile; but the most common system of all, and the most objectionable in the view of the institute, is to paint the name of the street on the bricks of the house. It is quite a frequent occurrence, as was mentioned at the conference, for the painter, when the name fades, to paint out the old name and then put in wrong spelling.

The type of plate most generally favored was one of plain cast iron, with raised letters in old roman type. The suggestion was also made, and met with considerable approval, that a competition should be promoted for a design for a good, efficient name plate for uniform use. Neither of these two proposals was definitely adopted, but the representatives of the municipalities agreed to report to their councils and to meet the institute again. Many of the delegates were afraid of involving their councils in heavy expense, but, as far as the members of the institute are concerned, they do not advocate an ornate or elaborate name plate; their view is that, if it is simple and thoroughly efficient for its purpose, it will be sufficiently artistic.

Another suggestion which was mooted at the conference was the desirability of a more general display of street name plates. Most people who have visited Paris have admired the thoroughness of the system by which the names of the streets are exhibited on plates of uniform design at every corner of every street and of the intersection of streets. This suggestion, however, met with a colder reception than the first, and the representatives of some of the poorer boroughs intimated that the cost entailed was more than their councils would be likely to contemplate.

### ARTIFICIAL-RUBBER FACTORY IN HOLLAND.

[Dutch press statement forwarded by Consul Frank W. Mahin, Amsterdam.]

A factory to produce artificial rubber has been established at Ymuiden, the port at the mouth of the North Sea Canal. It is said that the company instituting this factory has succeeded in producing a substance having the qualities of rubber and also certain special advantages over genuine rubber.

The process is a secret, but the principal ingredient of the product is said to be fresh sea fish, which are brought to Ymuiden in vast quantities by the Dutch fishing fleets. According to report 15 to 16 per cent of natural rubber is added to the fish, and the result is a substance as flexible and elastic as rubber, but much cheaper—about as 1.25 to 8 in price, compared with real rubber. The low price of this product will be caused partly by the by-products which are possible, for it is said that much albumin will be made from the fish and that half of the factory is arranged for the manufacture of guano.

It is stated that this artificial rubber can be vulcanized in a short time; that it is benzene-proof and can resist the effect of heat. At first sight the substance much resembles real rubber. A slightly fishy smell betrays the chief ingredient, but it is explained that this will be prevented by extracting the fat of the fish.

*Sunday Halifax-Montreal trains.*—Vice-Consul General W. Porter Boyd, of Halifax, reports that, through a change in the time-tables of the Intercolonial Railway, effective the first part of June, a Sunday service of trains to and from Montreal has been instituted and that there will, accordingly, be train connection between these two Canadian cities seven instead of six days each week.

**GERMAN EMPEROR'S PRIZE FOR AEROPLANE MOTORS.**

[From Consular Assistant Louis G. Dreyfus, jr., Berlin.]

In order to stimulate interest in aviation 50,000 marks (\$11,900) are offered as a prize by the German Emperor to the manufacturer of the best motor for aeroplanes constructed by a German manufacturer. The contest to determine the merits of the various motors will be held on October 1, 1912. A committee of 16, consisting of prominent officials of the Department of the Interior, the Ministries of Marine and of War, the Ministry of Education, the technical schools, the automobile and aero clubs, was appointed to manage the competition. The trials will be held at Adlershof, in the vicinity of Berlin, and must be completed before January 15, 1913. The committee of award consists of 7 members, all professors in the leading scientific schools of Germany.

Competing motors must (1) be manufactured by German manufacturers without the use of parts made abroad; (2) must be of at least 50 and not over 115 horsepower; (3) must be arranged for the propulsion of a propeller which in a 50-horsepower motor must not make more than 1,450 revolutions a minute, and in a 115-horsepower motor not more than 1,350 revolutions; (4) must not weigh more than 6 kilos (13.2 pounds) per horsepower, and furthermore, aluminum and aluminum alloys must not be used in the construction of the piston and the driving rod. Every competitor can enter motors of different kinds, but a difference of 15 per cent in the number of revolutions is not to be considered as a sign of difference. A similar motor can be entered, however, if duly registered as a replace motor.

Entries can be made to the committee up to July 1, 1912, on blanks, to which the affirmation of the applicant must be attached, that the motor is made in a German factory, that no parts of foreign manufacture are used, that he subjects himself to the final decision of the jury, that no suit for damages will be instituted even in case the motor is damaged. A full description of the motor as well as a drawing must be furnished. A deposit of 500 marks (\$119) must be made to cover the trial expenses. All motors which are to compete must be delivered at the testing grounds by October 25, 1912. For the test a benzine weighing about 0.72 kilo (1.587 pounds) per liter (1.05 quarts) will be supplied and only such benzine can be used.

In addition to the Emperor's prize of 50,000 marks (\$11,900), a second prize of 30,000 marks (\$7,140) is offered by the Imperial Chancellor, a third prize of 25,000 marks (\$5,950) by the Minister of War, and a fourth prize of 10,000 marks (\$2,380) by the Minister of Marine.

**National Aeroplane Subscription.**

As a further evidence of this great movement for the extension of German aviation, a proclamation has been posted in most of the banks and prominent business houses throughout the Empire saying that subscriptions are being taken for a national aeroplane subscription. This proclamation is signed by Prince Henry of Prussia, brother of the Emperor, as well as by other well-known subjects. Gala performances are being given at some of the theaters, the proceeds of which are destined to swell the national fund.

---

*Iron ore* imported into Germany during the first three months of 1912 weighed 4,416,900 metric tons, against 3,429,300 and 2,203,100 tons in the respective periods of the two previous years.

**SPEED OF TRAINS IN GERMANY.**

[From Consul George Nicholas Ifft, Nuremberg.]

The speed of German passenger trains, even of the express trains, is not usually remarkable. The so-called "Schnellzuege" and "Eilzuege" ("fast" trains and "hurry" trains), for the first of which an extra charge is made, are both ordinarily deliberate in their movements, and accommodation trains and "locals" often spend much time between stations, usually in sight of each other.

However, German trains usually run on schedule time. The new summer time-table for the German State Railways Systems, just issued, shows some advances in speed, principally, of course, for through trains. The fastest train in Germany is the so-called "D-Zug 20" between Berlin and Hamburg, which maintains an average speed of 55.177 miles per hour. This throws into second place the express from Munich to Nuremberg (leaving Munich at 8.15 a. m.), which heretofore has been the fastest train in Germany with an average speed of 54.991 miles per hour. In the third place is an express train from Berlin to Halle with an average speed of 54.929 miles per hour, and the fourth place is held by the express from Freiburg to Appenweier, in Baden, with an average speed of 52.941 miles per hour.
